Concentration of industry is the keynote of the German industrial reorganization. A typical instance is the merger of the Stinnes coal and iron trust with the Siemens-Halske Electrical Company, whereby 200,000 workers are controlled by one concern producing electrical power and manufacturing the most complicated machinery. As a result of this merger, Berlin, the Lower Rhine and Bavaria are brought much closer together. In the field of banking a similar tendency is noted in the fusion of the Deutsche Bank with the Hannoversche Bank, the Braunschweigische Bank, the Siddeutsche Bank, the Wuertenbergische and the Hildesheimer Bank, with an increase of capital of 125,000,000 marks. Here it is interesting to note that the German Overseas Bank at its recent annual meeting declared a dividend of 30 per cent. In October, 1920, there was established in Munich an organization for promoting German trade in the Near East—the Levante Bevisen Aktiengeselischaft, with a capital of 20,000,000 marks—which will interest itself principally in the tobacco business in Turkey, Greece and Asia Minur.

With the exception of East Africa, East Asia and Australia, all important parts of the world are again being served by German steamship lines, with chartered ships, ships of their own or in collaboration with foreign shipping companies. All German shipbuilding yards are turning out freight carriers of all kinds, coal and oil burners and sailing ships with auxiliary engines and motors.

The former German finance minister, Gothein, who has advocated the allowing of German prices to rise to world-market levels, as with completely free export and import, they would speedily do, shows in the Berlin Tageblatt that the main causes of low German production cost are the artificially limited domestic and factory rents, state-subsidized food and very low railway fares and freight rates. Many of the items of production cost are far lower, in gold, than before the war, this although gold prices in all free markets have risen greatly. Herr Dahlberg, an official of the Import and Export Licensing Bureau, estimates that German production cost is about a third of English. As Germany loses by dumping, although her individual exporters, who charge foreigners more than they charge natives, gain, Herr Dahlberg things that prices to foreign buyers should in the future be calculated in gold (the actual payment might be made in any currency at its gold exchange) and he suggests as a general basis the pre-war gold price, plus 150 per cent, also in gold. This would make German's gold export prices two and a half times as high as in 1914, which would roughly bring them to world-market levels.

The German state system of checking unjustifiable dumping has so far been unsuccessful. The Foreign Trade Boards have in principle refused to sanction exporting at prices materially below those of world markets. The prices of each export deal are considered in the light of the exchange of the day. But the Trade Boards, overridden by the Reichswirtschafts-Ministry and retarded by a needlessly involved procedure, work slowly; on the other hand the exchanges (not to mention the profit-devilish cost in marks and the production cost in foreign markets) fluctuate very rapidly. And so the price-testing mechanism fails.

German manufacturers have of course an advantage over the manufacturers of other countries owing to the low value of the German mark. How ever, it must be borne in mind that an export trade based on such conditions is not likely to add greatly to the wealth of Germany as a nation, for the fall of the mark adds a corresponding increase to the cost of the necessary imports of raw matcrials. If, however, Germany is able to sell her products to nations whose currencies are at a premium as compared with the mark and can obtain her imports of raw materials from countries like those of Eastern Europe, including Russia, whose currencies have a low value, Germany is in an advantageous position.

Many economists and business interests contend that it would be a serious blunder to deprive Germany of any advantage that she may be able to acquire legitimately in the markets of the world. They hold that it is obvious that rehabilitation of Germany's foreign trade is vitally important to a country poor in natural resources and faced with the necessity of paying an enormous war debt and indemnity. These authorities point out that in order to develop her industries, Germany must have copper and cotton from the United States, rubber from Brazil, hides and skins from Asia and South America, nitrates from Chile, zinc from various British colonies and numerous minor staples. Economists insist that in order to pay for these imports of raw materials Germany must export her manufactured goods.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Detroit—Building activities in four Michigan cities showed a gain for January, according to the compilations of the American Contractor, while in five other Wolverine centers there was a loss, as compared with January, 1920. The totals were as follows: Kalamazoo, $77,475, as compared with $38,800, gain 97 per cent; Lansing, $83,740, as against $49,035, gain 71 per cent; Battle Creek, $24,775, as compared with $18,348, gain 38 per cent; Bay City, $47,000 as against $37,000, gain 27 per cent; Flint, $46,926, as compared with $852,965, loss 94 per cent; Saginaw, $25,694, as compared with $52,415, loss 50 per cent; Grand Rapids, $267,247, as compared with $528,455, loss 49 per cent; Jackson, $14,160, as against $26,181, loss 46 per cent; Detroit, $3,981,943, as compared with $5,658,830, loss 29 per cent.

Grand Rapids—Thirty-four permits, the largest number taken out in a week thus far this year, is the record for the week ended February 18. The amount involved is $75,483 and is the second largest total among the seven weeks since the first of the year. The largest item is for a brick factory building in connection with the Fuller station of the Grand Rapids Malleable Works. It is to cost $25,000.

Detroit—Bids on cement submitted to the department of public works and the street railway commission have been turned down for the reason that they were considered too high. The majority of the bids were for $2.41 a barrel, although there were two bids at $2.39 and $2.29 respectively.

Grand Rapids—Business men of Grand Rapids are among the stockholders of the Belmont Sand & Gravel Company, recently organized here. Those mentioned as incorporators are Peter W. Decker, Bert S. Decker, Fred Raymond, M. Sluyter and Isaac Blamford. The Owen-Ames-Kimball Company is said to own a block of the stock. The company will take over about 120 acres of gravel land in Belmont, the gravel bed being on the Rouge River. The gravel is to be used for county road building in northern Kent and Muskegon counties.

Industrial Cost Chapter Organizing in Detroit

The Detroit Chapter of the Industrial Cost Association was formally launched this week when two score accountants from Detroit manufacturing concerns attended the inaugural dinner at the Hotel Tuller. A. W. Stannard, of the American Autoparts Company, was elected chairman of the Detroit organization committee, and A. Rae du Buell, of the Adams X-Ray Company, secretary. The other members of the committee are J. W. Baillie, Detroit Lubricator Company; E. M. Brown, American Blower Company; R. J. Honner, Penberthy Injector Company; W. F. Kennedy, Detroit Creamery Company; Stanley E. McGill, Art Stove Company, and F. W. Smith, Roberts Brass Manufacturing Company.

The Industrial Cost Association, which has its headquarters in Pittsburgh, is rapidly becoming an important factor to the industrial world and in a number of important cities organization of local chapters is under way, while in others they already exist. For instance, in addition to Pittsburgh there is an organization now in New York, and Detroit is the third large city to get in line. A Chicago chapter will be formally inaugurated March 8, while other cities to have chapters include Cleveland and San Francisco.

The principal object of the association is to make itself the voice of American industry on the problem of manufacturing costs, says an official announcement. It is not the voice of any special line of business, nor along with private interests to promote or to advertise, but purely and simply the voice of American industry as represented by the authorized executives of its manufacturing plants and associations of manufacturers.

Secretary-Treasurer A. A. Alles, Jr., of the parent body, enlightened the guests at the Detroit gathering as to the activities of the Association, which will include a program of methods to standardize cost and accounting terminology and to bring about mutual aid and discussion.

Builders Rap Combines Which Keep Prices High

The following resolutions were adopted at the tenth annual convention of the National Association of Builders Exchanges, in Savannah, Ga., February 14 to 17:

"That the convention raise its voice in protest against unreasonable prices as fixed by certain building material associations and that every means be employed to eliminate such practices.

"That such practice as the limitation of production, the restriction of the use of tools, the secondary boycott and other things of like nature be condemned.

"That the excess profits tax be repealed.

"That home ownership be encouraged and that each constituent body take up and carry on a campaign to this end."

About thirty members of the Detroit Builders & Traders Exchange attended the convention. President Charles W. Bernhardt, of Atlanta, Ga., was re-elected and it was decided to hold the 1922 convention in Memphis.

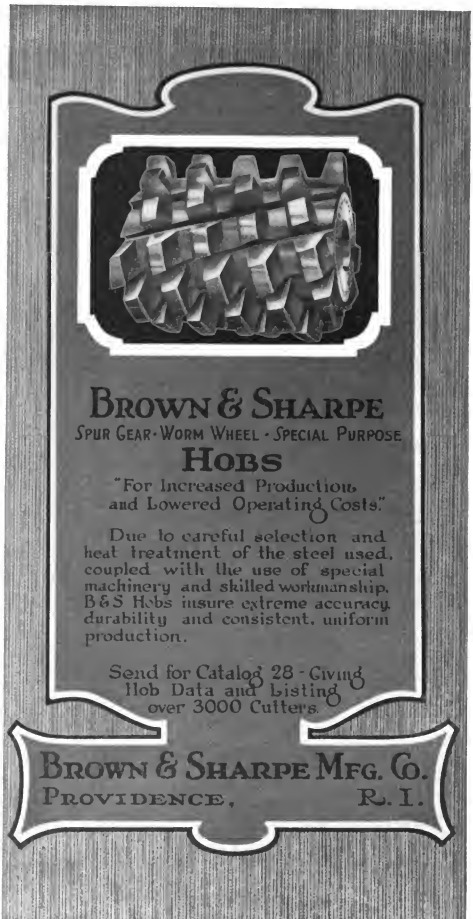
MARSH DIRECTS LINCOLN SALES

Ward H. Marsh, advertising manager of the Burroughs Adding Machine Company, Detroit, resigned to become sales and advertising manager of the Lincoln Motor Company, Detroit, March 1. Mr. Marsh first joined the Burroughs staff as a member of the creative division of the advertising department, but rapidly arose to assistant advertising manager and then manager. At one time he was with John Deere & Company. He has gained prominence as a writer and speaker on advertising subjects.

FRANKLIN GOES UP AGAIN

The H. H. Franklin Manufacturing Company, Syracuse, N. Y., has announced an increase in prices of Franklin cars, effective March 1, and ranging from $100 to $200. This is the second increase made this year, the first having been announced in January. Including both of these advances, the new prices will still be a few hundred dollars below the schedule in vigor in September, 1920, when the company was the first in the industry to follow the example of Ford. It reduced its war-time prices on an average $600. Franklin, it has been announced recently, is operating at capacity.

INDUSTRIAL ENGINEERS MEET



The March meeting of the Detroit Chapter, Society of Industrial Engineers, was held Thursday. The principal speaker was Johnson Haywood, of Miller, Franklin, Basset & Company, New York, consulting, industrial and production engineers, and auditors and accountants. The subject was "Is An Adjustment of Wage Rates Necessary to Meet Present Industrial Conditions?" Others who addressed the meeting were J. E. Morrison, president of the J. E. Morrison Company, and Gordon Stoner, assistant to the vice-president of the Detroit Pressed Steel Company. The meeting was held at the Board of Commerce.

BUILDING ACTIVITY FORECAST

James E. Beavis, field superintendent for the Michigan Employers' Casualty Company, Lansing, reports prospects bright for renewed building activities in Michigan. Building and road contractors, he says, are preparing for a strenuous season.

BEET CONTRACTS SENT OUT

The Michigan Sugar Beet Growers' Association sent out the 1921-22 contracts this week to the 9,000 members, asking them to adopt this contract and not sign agreements with manufacturers for less money. The Michigan prices will be based upon the Idaho growers' and approved by the American Farm Federation. These call for $6.45 a ton for beets with 5-cent sugar; $7.74 for 6-cent, $9.03 for 7-cent and $10.33 for 8-cent sugar. Cost of sugar is not expected to go above the latter figure.

Out-Of-Ordinary Features In Howell Motor Design Insure Dependability and Long Life

TO CONSTRUCT a motor in which the defects most common in the ordinary induction motor would be eliminated—has always been the objective of Howell Red Band Motor builders.

Ask any engineer why the usual electric motor fails in actual service and he will undoubtedly give you three reasons as follows:

Bearing troubles.
Insulation breakdown.
Defective rotor construction.

Rejecting the customary practice in electric motor design Howell engineers have constructed a motor characterized by the absence of these three principal imperfections most frequently contributing to uncertain motor performance.

The Howell Red Band Motor has a patented recentering feature in its bearing. This provides for quick adjustment when wear ultimately occurs, and eliminates long delays while awaiting replacement parts.

Large slots in Howell stators furnish ample space for the heavy slot insulation. Enameled wire, double cotton covered, provides against insulation breakdown.

With its end rings cast directly onto the rotor bars, the Howell Red Band rotor is unusually strong and stable, and is not affected by temperature changes. The Howell Red Band Motor has large overload capacity, with conservative temperature rating, 40° centigrade.

Because of the many superiorities in Howell design American industries everywhere place implicit faith in the ability of the Howell Red Band Motor to give never-faltering service.

Sizes of Howell Electric Motors are one to one hundred horse power. Write or wire your requirements.

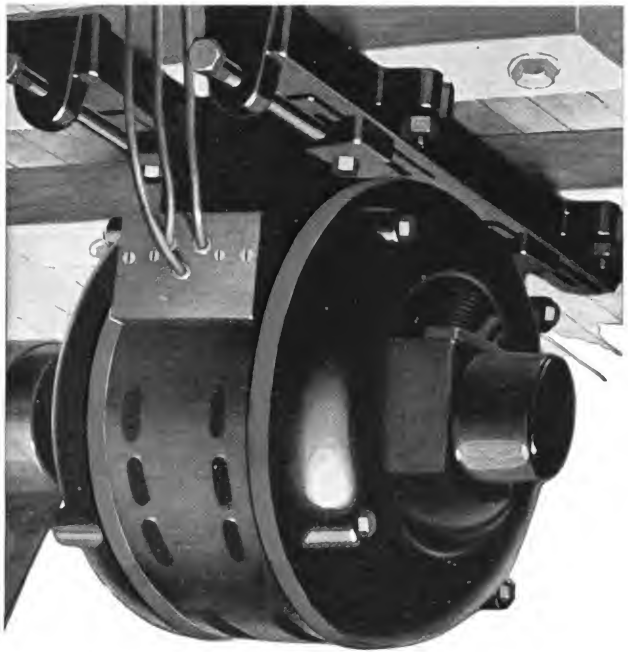
Profitable Business For Motor Dealers

THE Howell dealer organization is being enlarged to keep pace with our greatly increased manufacturing facilities.



And motor dealers who are qualified to render high standard service—the unusual type of service expected by the Howell motor user—will find the Howell agency a most valuable asset. Every Howell Motor dealer is offered 100% co-operation direct from the factory—co-operation which results in the sale of motors, and builds up a profitable business for the dealer. Write today for complete information regarding the Howell franchise.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

Published Every Saturday by the

MANUFACTURER PUBLISHING COMPANY

611 Free Press Building
DETROIT, MICHIGAN
Telephone Cherry 6010

Entered as Second Class Mail Matter at the Post Office at Detroit, Michigan

John A. Russell, President and Editor; Edward R. Grace, Vice-President; John P. Fitz Gerald, Second Vice-President; Ira W. Walton, Secretary-Treasurer; Harold High, Managing Editor.

Subscription Rate: Fifteen Cents a Copy. Five Dollars a Year in the United States, Canada and Mexico.
Advertising Rates on Application.

DETROIT, SATURDAY, MARCH 5, 1921

Let the Stockholders Have a Chance

THE NEW CODIFICATION of the corporation laws of Michigan is designed, among other things which are good and orderly, to make it difficult to procure lists of stockholders in Michigan corporations, which is not good or orderly. At present, corporations organized under the laws of Michigan, or domesticated in Michigan if organized outside the state, are required to file annually lists of their stockholders. These lists are open to the inspection of whomever chooses to look into them, and are, as a matter of office practice, copied by the Secretary of State and furnished to whomever cares enough for them to pay a cent a name therefor, which is about the cost of copying them. One of the uses to which such lists have been put in the past has been that of the brokers, who have used them as a basis of circularizing the stockholders with a view to interesting them in other investments, and the frequent receipt of overtures for such investments by people already stockholders in some or other company has been held by some people to be a bit of a nuisance. Hence the suggestion that the publication of such lists be suppressed, unless the inquirer be a stockholder in the corporation whose stock list is desired.

It is quite the custom of officials and legislators to propose new laws to meet private convenience rather than to promote the public good, and the increasing of the difficulty of getting at the lists of stockholders is one of these cases. To begin with, it is entirely out of harmony with the theory upon which corporations are organized. The corporation is composed of a group of people who put their joint capital into a given enterprise, each expressing for himself the limit of his liability either in his subscription for stock or his holding of the same. Where he has expressed his limitation in his subscription, it may turn out that he has not actually paid up, and exigencies have been known to arise in the histories of corporations where it is extremely useful for creditors to know to what extent stockholders have obligated themselves. Even where subscriptions have been fully paid up the actual or prospective creditors have a right to easy access to the stock list so that they may know to what extent the great names held out as directors, for instance, are backed up with substantial interests in the corporations. Very often people who have the director habit—and that form of human vanity is not uncommon—are used as "come-ons" for other stockholders or to give a fictitious credit to the corporate organization. Where directors have substantial interests the presumption is that they attend to the business of direction. Where they have small qualifying interests the reverse is often only too frequently the case. In any event, either the stockholder has a right to know how deeply his directors are interested in the business, or the actual or prospective creditor has a right to know the extent of the liability of each and all of the stockholders.

The concealment of the lists of stockholders has a tendency to limit the ability of the individual stockholder to look out for own interest. In these days of promoted companies, whose stock is sold broadcast by the hordes of energetic stock salesmen, one group working here and another group working there, there is absolutely no community of interest or neighborhood among the stockholders. As a matter of fact, such a community of acquaintance and neighborhood was actually presumed in the early days of corporations, the corporate form being devised as a method for the union of the joint capital of people closely allied, whose individual capital was not sufficient to undertake the enterprises which were possible under the corporate form. Today the same is quite generally true of a certain class of corporations. It is equally not generally true of that class of companies whose capital is assembled by the methods of the promoters. The individual stockholder, especially in a newly-formed company, who has made his investment upon the glowing showing of the glib stock salesman, is absolutely unacquainted with the body of the stockholders. The most that he has in the way of acquaintance is with his friend who asked him to come in, or with the friend whom he himself asked to invest. Now most of these companies are badly managed. Many of them are deliberately crooked in their management. If it is going to be made difficult for the stockholders in such companies to find out who the people are who are in the same hole with them, there is absolutely no method for them to associate a reasonable stockholding interest with themselves to protect what is left of their investments. We have in mind a group of insurance companies which were organized in this state a few years ago, the capital and subscribed surpluses of which were murderously scalped by the so-called "fiscal agents" in combination with the organizing officers. In these cases the stockholding lists not being on file with the Secretary of State, it was next to impossible for stockholders who wished to protect themselves to discover whom were their partners in distress.

No good can come from the suppression of lists of stockholders. It may be a little annoying for people who are fortunate enough to be owners of stock in prosperous companies to be importuned from time to time to make other investments. But they should be philosophic and cheerful, like the colored gentleman who was asked to change the twenty-dollar bill and who expressed his thanks for the compliment. Their convenience should not be made an excuse for the adoption of a system which would make every group of scalped stockholders helpless so far as communication with each other is concerned, whether for the organization of a committee for mutual protection or for getting the law on the fellows who have done them out of their capital.

The Beginning of a New Regime

THIS WEEK the people of the United States go under another government, using the term in the sense which the English do when they pass from one theory of administration to another. The official tenure of President Wilson and of most of the people who hold office by the grace of his commission ended with the inauguration of President Harding on Friday of this week. The country having given a commission to the candidates of the Republican party to do the executive part of its governing, following an earlier similar commission respecting the legislative part of the government, passed this week into a condition in which it has not been for some time, namely one in which the executive and legislative departments are in complete political harmony. The portion of the executive department which is most important is that which is located in Washington. That portion which merely carries out orders is not of so much importance. It makes little difference what is the political persuasion of the postmasters, the collectors of customs and revenue the district attorneys, the federal marshals and other officials of corresponding classes, because, luckily, there have usually been enough citizens found in both the leading political parties to do the work of these places quite acceptably. But the executives at Washington are important. They are the people from whom administrative orders issue, which can put one complexion on the statutes in one case, and quite another complexion in another case. That this group is going to be changed is quite an important matter to the country, if it is made important.

Digitized by Google

For reasons not wholly chargeable to the outgoing administration, the last eight years have constituted a period during which much of our federal government has been by administrative and executive order rather than by statute. The exigencies of the war had a good deal to do with this condition, although they did not have all to do with all of it. As a result, in the relations of the government with labor, and in the relations of labor with employment, we have seen times when the views of Secretary Wilson and Assistant Secretary Post, and the influence on their views of Mr. Samuel Gompers have had results that surely were never contemplated by our lawmakers. In the administration of our revenue-producing laws we have had interpretations and executive and administrative orders which seemed to be more clearly directed by the class consciousness of office-holders drawn from the southern part of the country—a class consciousness which directed the official mind along the lines of making the northern taxpayer pay that "nigger bill of 1861-65"—than by any clear study and interpretation of the law. The same system of administrative and executive control affected the management of the railroads and the communication systems. It had to do with the application of statutes affecting other forms of business. It may have been time that the growth of such conditions was given impetus by the needs of the war. But it is equally true that the habit, once fastened during the war, was not loosened after its close.

At any rate, the war in now over, and the gentlemen who take executive office under our new President are not bound, either by habit or tendency, to the plan of government by executive or administrative order, unless they, too, find it convenient to go outside the statutes and into forced interpretations to do the governing. If there is any one thing that the new administration owes the American people it is a return to the rule of law. We have not been under that rule nearly as much as we should have been for the last four years. Part of this was due to the war, part of it to the intellectually superior attitude of the President just retired, and part to the disposition of office-holders who were only too glad to take their cue from the chief executive, especially when it tended to increase their powers or to make their responsibilities less exact. This condition can happen among Republican office-holders just as well as among Democratic ones, because the first impulse of the average office-holder is to become a petty tyrant. Some of them become such from alleged moral views, some from intensity of disposition, some from the profit that comes out of it. Unless the chief executive insists on the rule of law, his underlings are very apt to supplant its salutary rule by the emotionalisms and uncertainties of administrative orders. Frequently these pass as progressiveism and as protests against reaction. To the American who knows his constitution they never pass as law.

Mr. Harding's administration may bring many salutary changes in our national economic system and in our financial schemes. It is sincerely to be hoped that this will be the case. But the first thing it should bring is a surcease from personal and varied interpretation of the law by petty officials. When we need our laws interpreted, the doors of the courts are open. When recourse is had to them, the interpretations will at least have the merit of being uniform.

Secretary Denby

DETROIT gave one of her best citizens to the nation, this week, when Edwin Denby went to Washington to be Secretary of the Navy. It was not the first time she had given Mr. Denby, for he went away to serve his country back in '98 as a common sailor, and again, four years later, as a member of Congress, and again in 1917 as a private of Marines in the World War. Each time, his work accomplished, he has come home full of honors. No one doubts he will come home again, when this task is done, with a record of equal distinction.

From his pronouncements made since his appointment, one gathers that Mr. Denby has a very definite policy in mind, and those who have watched his career—and that includes everybody in Michigan—know that when he sets out to accomplish a purpose, he is not easily diverted from his course. Withal, Mr. Denby's personality and his methods are anything but belligerent. Whether the country is in or out of sympathy with his ideas, it will never be out of patience, acrimonious, with him, for Mr. Denby is, above all, a most likeable man—a man who always has and always will appeal to the popular fancy. Moreover, there's a glamour attaching to "the 'gob' who rules the Navy." It is easy to predict that within three months Mr. Denby will be the most sought-after member of the Harding cabinet.

Edwin Denby should grace the Secretaryship, first because the Navy, perhaps, was his first love; second, because his experience should enable him to bring to bear on the Navy's problems a mature understanding of its traditions and its problems; but probably most important, because he is "Ned" Denby—broad, kindly, whole-souled, a born diplomat.

Short Measure Stuff

PRAYERS

I hear the auto owner pray
He is hard up, I ween.
I hear him say, "Give us this day
Our daily gasoline."
—Luke McLuke.

I hear the pious baker pray.
He is hard up, I know;
I hear him say, "Oh, Lord, give us
"This day our daily dough."
—Hastings, Neb., Tribune.

I hear the pious lawyer pray,
With tears upon his face,
He says, "Oh, Lord, give me today
"A fat and juicy case."
—Warren Daily Tribune.

I hear the meek munitions man,
Praying for all he's worth,
"Dear Lord, don't let there be too much
Of this here peace on earth."

* * *

THE FIRST ROBIN SWEEPSTAKES

The First Robin Sweepstakes certainly started something. A batch of letters have arrived from entrants with all sorts of alibis but no affidavits. It would appear that everybody everywhere is waiting for the first robin to appear. We have at least helped revive his popularity and perhaps taken a few minds off other things that can't be helped very much anyway, such as the business depression, the cabinet, the inauguration, the tariff, the state income tax, the Detroit United Railway and, as our learned contemps, R. Lardner, would say, and etc.

J. L. W. writes from Saginaw: "Lay off the robins and talk about the robbers why don'cha? When they get through there won't be nothing left but a few crumbs, hardly enough for the birdies to live on."

F. E. T., of Detroit, was moved to poetry, tf you don't care what you say. He screams:

"Believe me, old top, if coming close counts, you had better ship the plate glass toothbrush right along." Listen—

A twitter in the tree, Oh, by gee,
The plate glass toothbrush belongs to me,
Sneaked up the alley, heart a-throbbing,
To get a look at the first spring robin;
Curses my kingdom for a bow and arrow,
Another one of those pesky sparrows.

L. F., Benton Harbor, writes: "My coal pile is getting pretty low and I don't want to buy any more, so every time I drop another teaspoonful into the furnace, I climb upstairs and look around for a robin, to tell me that soon I might be able to let 'er go out for the summer. If I see him, I'll contribute another prize to the sweepstakes, a barbed wire mattress that has been in the family for several years, and grandpa's favorite toothpick. Wire me at my expense as soon as the robin turns up. If one lands hereabouts, I shall be so tickled, I'll call him in and give him a nice plate of soup."

* * *

President Harding, we greet you. Take good care of our Ed and send him back as kindly and genial as ever.

* * *

The boys who found their neighbors' sidewalks too narrow when they came home at night, now find sidewalks of their own too wide when they come to shovel off the snow.

* * *

San Antonio has two new industries, the product of Detroit capital. They are turning out glass arms and charley horses in quantity production.

* * *

Now that the legislature has done most of its investigating and probing, the lawmakers are apt to get to work most any time.

—A. F.

FINANCIAL

THE BUSINESS OUTLOOK

By PHIL S. HANNA

IT IS NOW more than five months since the price of Ford cars was slashed without warning. While the cut was an effect rather than a cause of the depression, as many erroneously presume, yet it was about September 21 when it became difficult to find a market for that second-hand car and when men began to think seriously about meriting their own continuance on the payroll. And notwithstanding the bulk of opinion to the contrary, normalcy in many respects began just at that juncture in business consciousness.

One of the prime requisites of normalcy in business is that we regulate expenses so that a portion of earnings may go into savings accounts or other forms of reserved wealth and that we invest such wealth in constructive enterprises which will provide more jobs and, concurrently, additional savings. But it is a strange perversion of mind that urges less savings when margins of profit (or margins of earnings over necessaries) begin to increase, as was commonly the case before September 21 But now there is testimony from a large number of banks that notwithstanding the drop in aggregate volume of savings deposits, each day since September 21 has seen new faces at the savings window, and the explanation in each instance is precisely the same, i. e., that the depression brought home, as nothing else could to many easy spenders, the necessity of having a reserve.

The former secretary of commerce, William C. Redfield, gave a talk at the Board of Commerce last week which should have been heard by every business man, large and small, in Detroit. And what he said has considerable connection with normalcy. The gist of it is that the United States cannot be normal without foreign trade. The thought came up frequently during his remarks, What would have been the course of business in the United States if the war had not come when it did? Economists have often pictured the isolation commercially to which we were drifting in 1913 and 1914, but now, with England loaded with huge debts and our debts to her largely paid up, we have the advantage and the opportunity which is golden. Yet apathy reigns so far as going into the fight for foreign business is concerned. The name of the new foreign trade bank is significant. It is something larger than a mere machine for collecting foreign accounts, for, as the name "Foreign Trade Financing Corporation" implies, one of its chief functions will be to finance the purchaser at the other end.

It is difficult to understand why more corporations have not signed up readily for stock. As Mr. Redfield pointed out so forcefully, one of the main reasons for England's control of Brazilian and other South American markets is her enormous investments in railroads, factories, plantations and public utilities in those countries. When any goods are needed England gets the order as a natural consequence. And what is more noteworthy to prospective stockholders in this country, to whom foreign investments may seem a trifle speculative, the large English companies that have been investing in foreign enterprises for many years have found that the average of losses is comparable favorably with losses on domestic enterprises, to say nothing of comfortable dividends since way back in 1600 when England began her foreign trade campaigns.

In the local markets the bull fever is catching and we are glad to see the malady again. It has been some little time since we have met a bullish broker, but one of them explains it all by saying that the feeling has come because the public has gotten used to abbreviated margins of profit and abbreviated incomes. This is fine and will give quite a little momentum toward clearing the March 15th hurdle when income taxes are due; but let us not get rash in our expectations, for there is a bill of some 65 millions which Detroit must pay before the tide may be expected to flow permanently inward again, and that bill is figured from the bank statements which made their appearance the past week. On February 21, thirteen of the larger banks had capital, surplus and undivided profits totaling approximately $59,900,000, whereas those same banks had borrowed money liabilities totaling $68,800,000; on the same date deposits in the banks included in the computation were $404,000 while loans and investments were $405,900,000. The excess of loans over deposits is approximately equal to the total capital, surplus and profits, $59,900,000. Had our banks been less interested in the welfare of their clients and in the prosperity of Detroit they might have justifiably shut off loans long since but they are behind the merchant and manufacturer to the limit, which fact, according to sentiment coming from some quarters, is not now appreciated. After present difficulties are passed and sober reflection sets in possibly Detroit banks will get credit for their labors.

The annual report states that "inventories have been substantially written down so that the company will not be handicapped by having to take into 1921 operation losses of 1920." Production for the year was 344,600 barrels, instead of 550,000 as planned, on account of shortage of coal, and mill troubles

GLADYS BELLE OIL LIST

Both preferred and common shares of the Gladys Belle Oil Company have been removed from the listed stocks on the Detroit Stock Exchange and are now traded in the unlisted department.

The annual meeting of the S. S. Kresge Company will be held March 25, but the books will not be closed. Stock of record March 10 will be listed for the purposes of the meeting.

(Information concerning earnings and expense not furnished)

President C. A. Pfeffer comments in his annual reports as follows: "The net of our position is that we are in a liquid position—with no accumulation of unsold merchandise on hand—with a car representing advanced engineering principles attracting both dealer and public interest, and a dealer organization carrying only a nominal supply of cars."

Phone Betterments Paid For by Allied Companies

Notwithstanding increased rates, the Michigan State Telephone Company finished 1920 with an excess of expenses over income amounting to $1,230,485. Furthermore, the deficit occured in spite of the fact that no dividends were paid. In comparing the balance sheet of December 31, 1921, with December 31, 1920, it is interesting to note that approximately all of the money invested in plant improvement and extension was furnished by affiliated corporations and not from local sources. Had the company been obliged to operate as a home concern, relying on its own earnings structure as a basis of credit, it is doubtful whether any extensions or improvements could have been made, to say nothing of improved service. Plant account increased $5,091,000 and the reader will note a corresponding increase of $5,073,000 in the item "advances from system corporations."

A comparative statement follows:

Note—Statement of earnings and expenses was given in last week's issue.

In his report to the stockholders President Frank C. Kuhn says in part:

"In the face of great difficulty in securing adequate quantities of material and labor during the greater part of the year, much has been accomplished in improving the condition of the property and substantial additions to the plant have been completed. Because of restrictions on the use of material during the war, coupled with the great demand for service since the Armistice, it has not been possible to restore the margins of plant that normally it is desirable to have. It has been possible, however, to meet nearly all the demands for service, and except in a few sections of the larger cities, facilities are available or are planned for the immediate future.

"Great improvement has been made in the transmission over toll circuits. Very extensive tree-trimming work was necessary in the late summer and early fall, but the improvement in transmission resulting from this work is very satisfactory.

"Through the meetings of supervisory forces, departmental managers and executives throughout the state an esprit de corps has been developed that is going to mean much to the employees and the company. Everyone now has come to appreciate that his or her success and welfare is absolutely dependent upon the success of welfare of every other employe and of the company. Each one who is doing his best realized that those not putting forth every effort are a drag on the company and on the sincere workers. Elimination of those who are inefficient has been going on and will continue until the highest possible grade of efficiency is attained.

REVENUE BUREAU WARNING

In last week's issue of this publication there was an extended reference to the now famous case of Brewster vs. Walsh, in which the federal court for the District of Connecticut held that profits arising from sale of capital assets ined not be reported as income. Comment was also made that until the Connecticut decision had been reversed by the United States Supreme Court it would be advisable to hold up income returns for 1921.

According to advices since received from W W. Richards, manager for Jonathan B. Cook & Company, certified public accountants, Muskegon, the Internal Revenue bureau at Washington has gone on record during the last week as officially announcing that because of the severe penalties provided by law for false and fraudulent Income tax returns, taxpayers are warned not to omit from their returns for the year 1920 gains and profits derived through the sale of capital assets.

Members of the accountants' profession who have followed closely the trend of developments as regards income taxes have been expecting such a ruling for some time, and it therefore behooves those liable to taxes on profits from sale of capital assets to weigh well the question of whether or not such profits be omitted from their 1920 returns.

LANSING GAS ASKS EXTENSION

The Lansing Fuel Gas Company is asking the holders of its 5 per cent consolidated mortgage gold bonds, due April 1, 1921, to agree to a 10-year extension at 7 per cent because the entire revenue is now employed in operation and maintenance. New coupons will be attached to the old bonds and interest paid semi-annually. The company is now retiring $910,000 of these bonds also $743,000 in 5 per cent first refunding and extension mortgage bonds, due October 1, 1927. The capital stock is $700,000.

A DECISION ON EXCHANGE

Arthur E. Gordon, Detroit, justice of the peace, held a few days ago that the Highland Park State Bank must refund $500 to Peter Moroz which the latter paid for a transfer in 1917 of bonds to Poland. Owing to the war conditions the bank's correspondents were unable to deliver the money to the beneficiary in Poland and Moroz asked for a refund at the same rate of exchange as when he bought the draft in 1917. It is expected on appeal that the justice's decision will be reversed owing to the lack of decisions in like cases, but nevertheless the ruling has resulted in several of the foreign exchange agencies in Hamtramck, where there is considerable Polish business, incorporating a statement in their receipts that the sellers of the foreign exchange are not liable for refund except at current rates of exchange.

MOTOR WHEEL DIVIDEND

Directors of the Motor Wheel Corporation, Lansing, have declared a cash dividend of 2 per cent, payable March 21, to stock of record March 10.

Unusually Fine Bank Home For the Caro State Savings

There will be no more climbing up or slipping down the ugly front stairs of the State Savings Bank of Caro, which opened for business February 23 in its new $100,000 building, one of the most complete structures for a city of the size of Caro in the state. On Washington's birthday the bank was thrown open to the general public and a formal reception was held from 3 to 5 In the afternoon and from 7 to 9 in the evening. During both periods the lobby, the space back of the counters, the officers' quarters, the vaults and rest rooms were thronged with local people and visitors from surrounding cities. There were delegations from Bay City, Saginaw and Detroit, and the floral offerings vied with the visitors for floor space.

The exterior and interior of the new building are finished in Vermont marble. The Nachtegal people, Grand Rapids, put in the fixtures, which are the last word. There are rest rooms for the ladies, consultation rooms for the farmers and a treasurers' room on the second floor, where the township and village treasurers may hold forth during tax collection time.

One of the unique features making for safety is the large vault, which is split up into three compartments, one for the bank's money; one for depositors' safes, and there has been installed 300 safe deposit boxes, and one for the use of the abstract department of Ealy & Company, in the main vault there is a telephone running underground which connects with the central office by an independent line, and should all the employes be locked in by bandits, there is ventilation, food, water and communication with the outside. Another feature is the enclosed room for the machine bookkeepers, so that the noise of the equipment will not be disturbing. Then there is the publicity department arrangement, with 14 lines inside the bank connecting every department. As indicative of the spirit with which the officers have given over the rest and consultation rooms to the public, there has been hung in each room the following sign: "This is your home; use it accordingly."

The completion of this building is the culmination of plans which J. McNair Ealy has been nursing for some years and is a fitting milestone in the long and honored career of this institution, which was started in 1888, when the present J. McNair Ealy's father bought out A. T. Slaght & Company. In 1904 the bank was incorporated as the State Savings Bank, with J. W. Atwood as president and the elder Ealy as cashier. The latter became president when Atwood died in 1917, and when Mr. Ealy died, in September, 1918, the son succeeded to his position.

The bank has adopted the slogan, "The Thumb's Greatest Bank." Officers are: President, J. McNair Ealy; vice-president, Grant H. Slocum; cashier, Louis Wean; assistant cashier, C. R. Myers; directors, the above and L. R. Stewart, Walter S. Wixson, Peter Pardee, David J. Evans, John W. Quinn, H. F. Bush, Charles W. Stacey, W. P. Campbell and Amos L. Kinney. December 28 the bank had deposits of $989,855.

ELLIS REAL ESTATE COMPANY

Guy W. Ellis, who has been general manager of the Frischkorn Real Estate Company, Detroit, has organized the Guy W. Ellis Real Estate Company, Inc., with offices at 420 Griswold street, Detroit. Mr. Ellis is president of the company; L. S. Trowbridge, vice-president, and F. B. Ellis, secretary-treasurer.

INCOME TAX GUIDE

The Peoples State Bank, Detroit, is handing out a valuable income tax guide made up in the form of a government return, with arrows running from each blank space to be filled in, to an explanatory clause on the margin of the page.

Digitized by Google

Banks and Bankers

ANOTHER NEW BANK ON FOOT

Subscriptions are being taken by John Morton, formerly manager of credits of the Dime Savings Bank, Detroit, for stock in a new bank in Detroit to be known as the Commercial State Savings. Plans call for $1,000,000 capital and $200,000 surplus. It is the intention of Mr. Morton to obtain a large number of small stockholders, thus distributing the ownership of the institution as widely as possible.

OFFICE QUARTERS ENLARGED

The Bank of Saginaw has put in a stairway leading to the third floor of its building on East Genesee street and has equipped this entire floor to house the transit and bookkeeping departments. There is also installed a complete printing plant for the purpose of printing up supplies of all kinds, records, etc. Floor space has been a problem with the bank for some little time past and this arrangement will give more room on the main floor for tellers and officers accommodations.

IRON COUNTY NATIONAL

The Iron County National Bank, Crystal Falls, has increased its capital stock from $50,000 to $100,000. The bank, which was 21 years old on February 17, was founded by Jas. F. Corcoran and was known as the Iron County Bank. In 1904 Mr. Corcoran decided to incorporate the institution as a national bank, which resulted in the present name. The officers then elected were Mr. Corcoran, president; Charles H. Watson, vice-president, and J. J. Gaffney, cashier. The capital stock was $25,000 until March 1, 1907, when $25,000 was added. The business has been growing steadily and the bank today has more than $1,000,000 of deposits. The savings department has custody of nearly $750,000. Mr. Corcoran is still president of the bank and Mr. Gaffney is cashier, but H. C. Neely has succeeded Mr. Watson as vice-president.

NOW A STATE BANK

The bank of Byron Center has been reorganized under the state banking laws. R. O. De Weerd is president; S. Andriga, vice-president; Peter Holleman, cashier, and James Block, assistant cashier. The directors are Dan Burgess, Paul France, John Homrich and Messrs. Andriga and De Weerd. The capital is $25,000.

NEW OFFICES AT BOYNE CITY

The Peoples State Bank, Boyne City, soon will be located in its new quarters, which will provide much room and be more up-to-date. The furniture and fixtures are being installed and the vault has been completed.

BOOKLET ON INCOME TAX

Halsey, Stuart & Company, Chicago and Detroit, are distributing a pamphlet of 128 pages entitled "1921 United States Income and War Tax Guide." Complete rulings, regulations and examples are included. The index feature of the booklet should commend it to persons liable to income taxes.

MERCURY MFG. OFFICE CHANGE

Arthur W. Leet, transportation engineer, representing the Mercury Manufacturing Company, of Chicago, has moved his offices from the American Trust Company building to 403 Real Estate Exchange building, Detroit.

CUTLER-HAMMER CHANGES

The following changes in the personnel and district office territory of the Cutler-Hammer Manufacturing Company, Milwaukee and New York, have been announced by W. C. Stevens, sales manager: G. S. Crane, who has been manager of the Cleveland office, will become manager of controller sales at the main office in Milwaukee. L. B. Timmerman will be in charge of the Cleveland office and will act in the capacity of assistant to A. G. Pierce, manager of the central district. The Cincinnati office will become a part of the Central district, with R. I. Maujer as branch manager. In N. E. Lightfoot will assume the title of manager of the heating department, with headquarters at the New York works, and will be in full charge of all matters relating to the sale of electric heating devices.

THE OLDEST HOUSE IN MICHIGAN

WOULD you be interested in a $10,000 paid-up life insurance policy which matured in nine years, returning $27,000 for the original investment?

We can offer you an investment which is an obligation of a Canadian trunk line railroad, owned and operated by the Dominion of Canada, which will at maturity entitle the purchaser to the equal of 7% compound interest and approximately 90% profit, if he is willing to forego interest for nine years. We believe this investment will prove interesting to large income tax payers.

H. W. NOBLE & COMPANY
Bond Department
318 Dime Bank Building Detroit, Michigan

DIG DEEP

Before you purchase an investment security, dig deep to find what underlies it.

Don't be satisfied with the appearance of the surface. Penetrate the sub-soil—get down to bed rock—then make your decision.

Our First Mortgage Bonds will stand analysis. You will find, first, an obligation of responsible men; second, collateral security worth twice the mortgage; third, the unqualified guarantee of this corporation, with resources of $7,000,000.

Let the D. U. R. Help You to Lower Taxes

By FRANK W. BROOKS
(President the Detroit United Railway)

The one item of living costs that has gone highest during recent years is TAXES.

And, instead of coming down with most other costs, taxes seem to be going HIGHER.

For Public Officials, national, state and city, are placing on your shoulders many additional burdens.

In Detroit they are today asking you to finance a Street Car System for which we stand ready to furnish EVERY CENT.

Pass the Service-At-Cost Ordinance

YOU can avoid this whole expense by passing the Service-At-Cost Ordinance, April 4.

This Ordinance relieves YOU of all tax levies and bond issues for Street Car Service, and places the whole burden and risk on US.

* * *

THE time has come for every citizen of Detroit to look this problem squarely in the eye. Nor can you allow yourself longer to be deluded by any distinction between TAXES and BONDS.

Taxes are debts you pay each other.
Bonds represent borrowed money; interest on them is paid from taxes.

And the taxes of today go largely to pay off the bonds of years that have gone before, for a bond, like any other mortgage, must be paid at maturity.

* * *

EVERY CITIZEN of Detroit, whether a property owner or not, pays city taxes.

High taxes mean high rents, and high rents mean high prices for everything you buy, for the merchant must always set his prices high enough to pay his rent.

In Detroit we will be wise to halt immediately every effort directed at higher taxes. Taxes CAN be made so high as to drive people out of town.

* * *

DETROIT has far better uses for your tax money than any investment in stub ends of street car lines, implying double fares to you, and stupendous yearly losses you must surely be taxed to pay.

Better schools, a better water system, park improvement, street paving, public wharves, a subway or an elevated—all these are needed. And, either directly or indirectly, THEY WILL PAY.

* * *

BUT PUT THE BRAKES ON WASTEFUL CITY EXPENDITURES!

Vote "Yes" on the Service-At-Cost Ordinance, the broadest and most liberal offer ever made a city by a public utility!

F. W. Brooks

D. T. A. MOVES HEADQUARTERS

The Detroit Transportation Association, formerly located at 319 Fort street west, has moved its offices to 1050 Third avenue, where it will have plenty of room for the executive offices, reading room and meeting hall. The rapid growth of the association and its steadily increasing scope of activities rendered the old quarters too small.

An Understandable Statement

MEMBER FEDERAL RESERVE BANK

At the Close of Business February 21st, 1921

I—Cash ..... $ 1,308,085.99
(Gold, Bank Notes and Specie) and with legal depositaries returnable on demand.

II—Checks on Other Banks ..... $ 213,855.17
These checks are payable in one day.

III—Loans to Individuals and Corporations ..... $ 8,093,912.84
This is the amount we have loaned (after a thorough investigation) to individuals and corporations on their notes end against approved collateral.

IV—Mortgages on Real Estate, and Bonds ..... $ 4,467,340.60
These are salable securities issued by the U. S. municipalities and other corporations of first quality; also first mortgages on high-class real estate.

V—Stock in Federal Reserve Bank ..... $ 42,000.00

VI—United States Securities ..... $ 556,745.00
This includes U. S. Government Bonds, War Savings Certificates, Revenue Stamps and United States Certificates of Indebtedness.

VII—Branch Banking House and Furniture and Fixtures ..... $ 394,879.27
Eleven of these branches, all located in the city of Detroit.

VIII—Other U. S. Government Bonds and Certificates of Indebtedness ..... $ 615,600.00
Left with us for safe-keeping.

Total Assets $15,692,418.87

Total Deposits Entrusted to Us, Feb. 21st, 1921 ..... $14,079,114.30
The officers and directors always have this in mind when making loans and see to it that the assets are in such form as to enable them to meet all requests made by depositors.

This Leaves Capital Stock, Surplus and Undivided Profits of ..... $ 1,613,304.57
Which becomes the property of the stockholders after the depositors are paid in full, and is a guarantee fund upon which we solicit new deposits and retain those which have been carried by us for many years.

ESTABLISHED 1853

First State Bank of Detroit

Main Office: Lafayette and Griswold Street

Eleven Branches:

Gratiot and Hastings	Hamilton and Webb	Jos. Campau and Newton
Chene and Gratiot	Ferndale and Springwells	Forest and Van Dyke
Mack and Mt. Elliott	St. Clair and Mack	Linwood and Vicksburg
Woodward and Eliot	Grand River and Virginia	Park

Public Service Operations at Cost

(Continued from Page 6)

ta es automatically is indicated as necessary, and repeated rises may be indicated if the index reserve still continues to fall. On the other hand, when the upper designated level is reached, a decrease in fares is automatically indicated to be in order and repeated decreases are to be put in force if the index reserve fund still continues to grow.

The size of the reservoir of capital and separation of the two levels of course fixes the time lag between changes in costs and changes in rate. Make the fund too big and the levels too far apart, and the adjustment is unnecessarily slow; make it too small and the levels too close, and the fluctuations are not sufficiently ironed out. Moreover, as a system grows, the normal size of the index reserve fund and the separation of the levels should grow too.

The Extent of the Reservoir

Four to 12 per cent the value of the system seems to be a size at normal level which has been used. We find that in some cases where the plan has been applied, the index reserve fund is drawn upon in case other reserves like the depreciation reserve fall below a safe figure. This seems a logical thing to do, provided the withdrawals to restore other reserves are not made in too big lumps and cause a double fluctuation in rates (once up and then shortly down again) that would be unnecessary with a longer spread. The necessity of having funds tied up in this index reserve fund disturbs some persons as being uneconomical. If it were necessary to keep this fund in the bank at 2 per cent or in high grade quickly marketable securities, that might be a valid criticism. Even then, the benefits would be worth the price. But nevertheless it is not essential to preserve this fund in just this way. It may be treated as a bookkeeping reserve and cash put to work—in the same manner that the depreciation reserve is now commonly handled.

The Murder of the Incentive

One fault that was laid to some early efforts to work out a "service-at-cost" franchise was that it killed all incentive for progressive management. In that it fixed a dead level of return on interest which would be earned anyway and could not be exceeded by the same management. So it is seen to be highly desirable to give the company some participation in economies of operation and finance.

It would seem that such an incentive should be double-barreled—there should be one division of economies secured, for the company, and that means for the stockholders. There should be another division of the economies for the men and management, and that would forget all about the stockholders. Unless the incentive or bonus which you try to work into a cost-of-service plan is double-barreled in this way, it only partly rises to its possibilities.

Economies are reflected in the level of the index reserve fund as well as drops in prices of labor and materials. I think that it is entirely practical to base two specific inducements on its levels: First, when rates drop in a certain way, the annual return on value shall go up; and, secondly, that salaries and wages shall correspondingly have a percentage bonus. Perhaps it would be well to say that the basis of figuring these two bonus incentives should be recase every five, ten or fifteen years, so that as the peculiar economies of one property and management are overtaken by the general progress of the art, the public shall not continue to pay the bonus. This is in a way an extension of the idea of patents for inventions.

Control of the Bonus

It is not sufficient to say that the bonus either to the stockholders or to the men and management, should merely rise as rates fall of or fall as rates rise. Costs and rates naturally tend to rise as prices rise, and it will not do to cut off the inducements for economies and efficiencies at this time when they are not needed. The thing to do is to set up parallel ranges of base rates as base costs as measured, say, by bank loans (or the Dun index figures for price of all commodities and labor might be used.) From such a table a base rate can be found that is normal for prevailing cost of money (or prevailing prices of commodities and labor). Then for each step that actual rates are lower than this normal rate, let the bonuses be stopped up in accordance with the bonus schedule or scale.

Suppose we found by careful investigation that fares of a certain street railway under normal operation with fair profit were more or less as follows:

3½ fare	3½ per cent money
4 fare	4 per cent money
4½ fare	4½ per cent money
5 fare	5 per cent money
5½ fare	5½ per cent money
6 fare	6 per cent money
6½ fare	6½ per cent money
7 fare	7 per cent money
7½ fare	7½ per cent money
8 fare	8 per cent money

This is purely illustrative and it is not intimated that these figures apply to any specific railway.

If actual fares were 7 cents and bank money was being loaned out at 6 per cent, then this hypothetical company would get no bonus, for the normal fare for 6 per cent money was 6 cents. If, however, by good management and effective co-operation by the employes the fare has been brought down to 5½ cents in times of 6 per cent money, then the company and the employes would get one step of a bonus—say ½ of 1 per cent extra return on the franchise valuation for the company, and for the men 1 per cent bonus on their yearly wage. If continued progress by company and employes brought the fares down to 5 cents as money still stayed at 6 per cent, then the company would be allowed 1 per cent extra return on valuation and the men would get 8 per cent bonus on wages.

The Practical Rather Than the Perfect

One condition here must frankly be faced. There are various arrangements which can be demonstrated, at least to other engineers, or to business men and to lawyers, to be scientific, fair and promoting service and economy; but under some local conditions they may become too "high-browed" and so open to such misconception that their attempt is unwise. It is necessary to take the practical view, then,

---

TO CHANGE TIMBER TAX SYSTEM

Acting upon the suggestion of F. H. Sanford of the Michigan State Farm Bureau, department of forestry, the Michigan Hardwood Association has appointed a committee of three, with W. L. Saunders, Cadillac as chairman, to work with the farm bureau to effect corrective tax legislation with respect to Michigan timber lands. Investigations by the farm bureau department shows timber owners disapprove present tax methods, which levy a yearly tax on assessed valuation of standing timber, whereas the owner may realize on this but once, when he cuts and markets the lumber. This, it is claimed, forces owners to lumber off their holdings as rapidly as possible, and brings about over production and depletion of supplies. The Bureau and Association proposes a system of deferred taxation whereby the annual tax will be based upon the bare land value when the timber is marketed.

of using the best plan which stands a chance of being accepted.

It was stated earlier in this discussion that a cost-of-service plan would hardly take care of itself, with perhaps a little oiling and winding up once in awhile. There should be some supervisory authority to see that the provisions of the franchise are carried out, to have a voice in making of the utility's budget, to determine whether or not that amount and quality is adequate with due economy, to exercise some audit over the accounts to see that operating costs are separated from capital expenditures for improvements and extensions, and to see that the payrolls are fair. The man for this supervisory job is an engineer, and as capable a one as can be secured with the available means to pay him. He is to have such few engineering, clerical and accounting assistants as the size of the system warrants.

Freedom of Supervisors

Where the regulated utility has a very large property, a board or commission of two or three engineers may perhaps be advisable instead of overloading a single individual or making his duties too general.

It should be particularly insisted that he be paid as one of the operating expenses of the company but that he be not an employe of the company, it is usually to be insisted that he is responsible to the public, but that he be not a part and parcel of the city government departments. He must be free of coercion and have authority commensurate with his responsibility. He should be removable from office only for cause or at the expiration of a given term.

It becomes a bit of a problem how to afford a good enough utility supervisor under a "service-at-cost" plan in a smaller municipality. But if in these smaller towns various utilities are all put under the "service-at-cost" plan and all put under the security of one supervisor, the cost of a good man can be spared without undue burden on anyone.

Where all the municipal utilities have systems too small to support the proper caliber of supervisor, it would seem possible that the state public service commission could develop such a staff of engineers to administer the "service-at-cost" features of a large number of small franchises with capable men at low cost. Such supervisory engineers should certainly not be required, or able, to act in any sense as a manager of the utility. He should regulate but not manage. He should report when a service is inadequate or uneconomically liberal, when quality is poor or extravagantly gilt-edge; he should suggest or fix a reasonable medium but not decide too closely the detail or how this is to be attained. He is to correct improper accounting but he is not to be the company's auditor and bookkeeper. And when his directions and reports are contested by the utility, there must be left open an avenue of appeal therefrom.

Conclusion

This, then, is the story of the "service-at-cost" idea—what it is; where it stands; how it can be secured; what it will do. The story has purposely been kept very general; the plan has not been described for any one community or any one utility. All that has been said applies to New York or to Grand Rapids or to San Francisco; it applies to a street railway or to a water company or a gas supply.

In working out a plan or any particular place and utility, the franchise had better be kept as simple and unobscured as possible, lest complex details tend to bind it hand and foot or strangle it before it can demonstrate its great usefulness. It seems safer to err on the idea of crudity than refinement.

MARCH 1 RECORD DAY

March 1 was a record day on the Detroit Stock Exchange in point of volume of sales. The total amounted to 337,305.00 and in shares the total was 18,138. Activity in American Light, which touched a new high of 114, Ford of Canada, which went to 291, and interest in Continental Motors, Lincoln, Timken, Packard and Reo accounted for the increase.

DETROIT EXCHANGE GROWING

Sales on the Detroit Stock Exchange for the period January 29 to February 26, inclusive, totaled 457,452 shares. For the year 1920 total sales were 2,494,789 shares. The detailed list of sales will be published March 12.

STONEHAM SELLS TO CLARKE

E. H. Clarke & Company, New York, have taken over the Detroit office of C. A. Stoneham & Company, 904 Real Estate Exchange building. The same personnel will be retained in the office and J. H. Irwin will be the manager.

UNITED LIGHT MEETING

The annual meeting of the United Light and Railways Company will be held March 15. Common stock books will be closed at 3 p. m., Friday, March 4, and will remain closed until the final adjournment of the meeting.

Screws And Screw Machines

(*Continued from Page* 11)

the hand-operated, single-spindle turret or capstan lathe. This machine is built with six chucks held on a large circular plate, five toolholding rotating spindles being opposed to five of the chucks. The sixth chuck is used as a loading position at which point the operator casting or forging. All other operations are automatic. The face plate, holding the six pieces, advances toward the tools and each piece of work receives a separate operation. The face plate backs off, indexes and advances, bringing each piece of work to its successive operation so that after passing each of the tool positions a finished piece of work is presented at the unloading position. The time of finishing the piece, as in the multiple-spindle automatic screw machine, is only as long as the time necessary to load and unload the work is removed the finished piece and inserts a rough saved, as this is done while other pieces of work are receiving other machining operations.

The New Britain Automatic Screw Machine is also made with six spindles, which permits of the simplest form of tooling and consequently the highest degree of accuracy. By subdividing the operations and distributing them over the six spindles, a maximum amount of production is obtained. On simple work requiring not more than three operations to complete, two finished pieces can be produced at each indexing of the machine. On extremely simple work, such as studs, bushings, rollers, etc., stock may be fed in all six positions and six finished pieces cut off simultaneously. The efficiency of this machine was demonstrated recently in a test made by the Champion Ignition Company, Flint, in which 4,440 spark plug shells were produced in 21½ hours. The time per piece was 14½ seconds, and the stock used was 1⅛-inch hexagon bar steel. The result of this test was the placing of an order for 31 New Britain machines.

Other Installations

The Buick Motor Company has approximateri 85 New Britain machines which are used in the production of parts for the Buick automobile. The Packard Motor Car Company has 60 New Britain machines of both kinds, which are also used in the production of motor parts. The speed with which castings are machined in the chucking machine is shown by the fact that this company machines valve bearings on the New Britain machine at the rate of 100 an hour. All the operations of turning, facing, boring and reaming are done automatically, the operator having only to remove the finished pieces and replace them with unfinished castings.

The New Britain machine is very popular with firms who manufacture brass valves, as valves can be machined with this equipment approximately three times faster than by using a hand turrent machine, which is the older, though more usual, method. New Britain machines are used for valve work by the Capitol Brass Company, Peaberthy Injector Company, Michigan Lubricator Company, Scott Valve Company, American Lubricator Company and others in Michigan engaged in the machining of brass castings.

Another interesting job done on this machine is the making of piston pins as done by the Machine Specialties Company, Ann Arbor. The operation is that of drilling a hole through the length necessary for a pin and cut off. The six tool positions are arranged as follows: the first is a centering tool which starts the hole for the drills, the second, third, fourth and fifth are drills, each of which is set so that it drills one-fourth of the hole, and the sixth is the cut-off tool, which operates on a cross-slide. The production on this job is from 120 to 180 an hour, depending on the size of the piston pin.

LANSING BUYERS ORGANIZE

Buyers for factories and wholesale and jobbing houses in Lansing meet the first of the week to perfect a buyers' club, which is to be one of the units of the Western Michigan branch of the National Association of Purchasing Agents. The executive committee consists of L. D. Maxson, Olds Motor Works; Carl C. Richardson, Prudden anit of the Motor Wheel Corporation; Ed. L. Smith, Briggs Company; A. T. VanDervoort, VanDervoort Hardware Company; J. W. Gier, Gier Pressed Steel unit of the Motor Wheel Corporation, and Clifford K. Gleason, Novo Engine Company.

SCREW COMPANY BACK TO NORMAL

The Michigan Screw Company, Lansing, returned to a 100 per cent basis the first of this week, jumping from a 25 per cent schedule as a result of a quantity of orders from eastern points. The company has been employing about 100 men, which force has been increased to 500. During the last week the plant was overhauled and new equipment installed.

INVENTORY VALUATION

For Federal Taxation and Banking Purposes

Free on Request

FEDERAL Income Taxes are now engaging general interest. It was not strange, therefore, that when we published an authoritative discussion of Inventory Valuation in a recent issue, that there should have been a demand for copies which exhausted the supply and required us to prepare reprints.

The article was an extract from an address made by William M. Lybrand, President, National Association of Cost Accountants, before the January meeting of the Detroit Chapter of that Association.

The opinion and judgments of a specialist and unprejudiced observer on this important topic is presented. We want every banker, manufacturer, accountant, attorney and merchant to have a copy, which is why it was reprinted in booklet form for general distribution.

Inventory Valuation will prove helpful to those who seek or give credit, plan for the future or are concerned with the preparation of Federal Tax returns.

It summarizes principles of valuation that have stood the tests of time and that are governing in the present conditions.

Copies will be mailed free on application to

Production Managers—

Continuous Heat Treatment Furnace.

The following advantages are secured by the Continuous Method of Heat-Treatment:

Increased production per unit of floor space.

Reduction in manual labor per unit of production.

Uniformity of product, resulting in decreased scrap, following less dependence upon the human element.

The fuel economy that naturally follows the direct transfer of heat in spent gases to incoming material.

Improvement in working conditions by cooler shop.

In short, the saving in cost of the finished product due to economy in labor, time, fuel, floor space, decreased rejections, etc.

Do these advantages appeal to you?

Write nearest branch for Bulletin 217-B and learn whether this method is adaptable to your product and manufacturing conditions.

Cutting the Serpent Into Pieces

Rationals in North Dakota Not Content With Pulling Townleyism Fangs, Now That Operation's Under Way

By PHIL S. HANNA

THERE USED TO BE a popular boyish theory that the tail of a dead snake wiggled until sundown, or sun-up. Sundown or sun-up, the tail of the Townley organization is still wiggling in North Dakota. The Legislature has the serpent on the operating table with an X-Ray right on its vitals and has its horny mouth propped open with the clubs of the sergeant-at-arms of the House of Representatives.

The Townley gang is obstructing the examination in every way possible and has even been so gracious as to admit that an operation removing the fangs of the reptile might be agreed to; but the rationals are bent on nothing short of cutting the thing into bits and chucking it into the Missouri river, or cremating it. And their stand is well taken, for even with the fangs removed, the Townley machine has an enormous appetite for funds, which is not likely to abate readily.

But first let's correct any impression that even at its worst the state is bankrupt or anywhere near it. South Dakota, a commonwealth of similar area, population and resources, has a bonded debt of $40,950,000 and its credit is considered good, while North Dakota has a bonded debt of $340,000, to which at the outside not more than $19,000,000 will have to be added to clean up the mess caused by Townley et al. J. J. Earley, president of the North Dakota Bankers' Association, writes this paper as follows: "Please bring out the fact that the people of North Dakota are not downhearted and are not going to regret or grumble about the cost of the prescription necessary to cure the patient." E. G. Quumme, head of the Federal Land Bank of St. Paul, says that North Dakota has more per capita wealth than any other state and looks at the muddle as temporary. And there is much evidence of capital's going back into the state for private enterprise.

But the credit of North Dakota, while suffering under the present regime, will be better in the end than before the fuss because of the value of the lesson which the people have learned regarding radical and socialistic doctrines put into practice. The flour mill at Drake and the grain elevator at Grand Forks and perhaps the packing plant at Fargo will stand for years as a monument to the folly of state socialism and will be worth, as a preventative of future foolishness, both in the Northwest and elsewhere, much more than the amount of taxpayers' money sunk therein.

Since the two recent articles on this subject were printed in this paper, the following events have occurred which have strengthened sentiment in favor of immediate action toward removing the governor and some of the Townley tools in the administration:

The Scandinavian American Bank of Fargo has closed (second time).

The Legislature has started an investigation of the state industries.

A recall election movement has gained sudden momentum.

In its endeavor to stave off the recall, and raising more funds for defense, the Townleyites have resorted to desperate means of popularizing the Bank of North Dakota and of justifying its policies. They also have tried to borrow an oxygen tank to prolong life by offering the state bonds, given to the bank as capital, to the rich labor unions of the East. But it is to the credit of those in charge of the unions' funds that all such overtures have been promptly turned down. The Townley crowd also proposes to open the Bank of North Dakota to the public and hopes to gain the personal commercial and savings accounts of the Non-Partisan League farmers and business men. (The latter, if any.)

Another final wiggle of the snake's tail is an appeal by the Non-Partisan attorney general of the state, William Lemke, for personal contributions to a fund which he proposes to use in a legal battle against the League's so-called oppressors, the independents.

But, hear ye, here is the most significant thing. On March 4 they had a regular free-for-all in the final stages of the Legislature. Bloody noses, black eyes and sore heads resulted. And over as the effacement of the dignity of a law making body is to be deplored, it had to come and it always comes when men think seriously of the pocket as at stake. And some ingenious reporter up there in Bismarck started the song, "The Reds are on the Run," which, according to the mass of reports covering both sides of the story and used in making this narrative, is literally true.

A Poem About Dr. Ladd

The remainder of this article will deal largely with the details of the closing of the Scandinavian American Bank of Fargo, its history and the bearing this failure has on the whole situation. We shall also go into some detail regarding the investigation of the state industries, which is full of exposure of red fallacy. Therefore, any of our readers who wish to retire may do so and crank up their cars while the following poem headed "To the United States Senate on a Wild Oats Platform," and written by John Magill, of Verona, N. D. is being chanted (Dr. Ladd is now United States Senator from North Dakota. He is one of the chief potentates of the Townley outfit and his success in getting to the Senate is due largely to his espousal of the socialist cause in North Dakota):

Yes, indeed, it makes us sad
To see our late respected Ladd
Lay down his tubes and chemist's tools
To study Roberts' Order Rules.

If he would only with us stay
And write statistics day by day
We'd soon imagine wealth untold,
And think our streets all paved with gold.

We "millions" on our wheat have saved,
And on the dockage question raved
'Till it would seem that we must be
A prosperous community.

The Doctor to both men and mice
Is prone to give profuse advice
On how and when to sell their grain
And realize the highest gain.

Because of this we kept our wheat
So that all those who have to eat
Would thrice a tribute pay us daily
Which we might spend carefree and gaily.

Alas! It seems his good advice
Most "par bon" was for men and mice.
Since every last year's bushel ground
For us has lost a "cart-wheel" round.

But as we get 'bout thirty-three
Cents premium on each bushel we
Into the elevators haul
It natural seems that mostly all

Montana farmers, South Dakota,
Canada and Minnesota,
Living close would grasp our rate
By selling wheat within our state.

Yet they must be insane and blind
For doing nothing of the kind!
And broker "traitors" who rate their toll
By hauling wheat to outside soil!

But here's to Ladd, full credit's due him
For though so many hate to see him;
The N. P. League has done him good
While he upon its platform stood.

He has accomplished work unique
'Mong politicians to Senate tapas seek,
Precipitating ample votes
Upon a platform of Wild Oats.

The Scandinavian American Bank of Fargo has long been known as a Non-Partisan League institution, used for the purpose of financing the League and its affiliated organizations. It will be recalled that this bank was closed in September, 1919, amid sensational exposures. But at that time the Townley star was still in the ascendency, the supreme court was friendly to the red cause and Attorney General Langer, since deposed, and Secretary of State Hall, who were the majority members of the banking board, were reversed by the supreme court and the bank was reopened. This closing, however, is likely to be the last, for, as the investigation has brought out, the reserve of the institution are gone and neither the Bank of North Dakota nor Townley is in position to hand over additional funds. To give the reader an idea of how desperate the situation was at the time the bank was reopened in 1919, the state bank examiner, Lottbus, admitted under oath that this bank was reserve at the time of the supreme court ordered it reopened.

At the time of the audit by the independent accounting firm the Scandinavian American Bank had $443,000 loaned to it or deposited with it, by the Bank of North Dakota. Since the date of this report (December 3) there is nothing reliable to depend on as to the exact condition of the bank of North Dakota. But at that time some of the loans were as follows:

Digitized by Google

$650,000 to the North Dakota Building & Loan Association, $225,000 to the North Dakota Home Builders Association, $917,788.88 to the thirty-two banks that were closed, $7,816.72 to F. A. Pike, league attorney. (This item was afterward paid by the state auditor.) Of $2,-057,645.25 due from banks, $1,147,607.35 was past due, but the report does not disclose how this is figured.

The accountants' report of the affairs of the Home Builders Association summarized the situation as follows: Records incomplete and deficient; no adequate accounting system; no cost system used to show cost of individual projects; $311,119.62 charged to "construction expenditures," without detailed account; $57,-985.72 expended without obtaining vouchers in support of same; surety bond of $50,000 required of the manager expired July 15, 1920, but had not been renewed up to December 3; overdraft of $10,752.52 at Bank of North Dakota and a big supply of building materials bought a peak prices on hand.

And here are the high spots of the auditors' report on the Mill & Elevator Association: Flour valued at $129,001.52 sold to the Consumers United Stores Company, a Non-Partisan affair, with no records available from which to check the account; other sales of like nature, including total amounts credited up to $170,807.42; no balance sheet or profit and loss account, (This was the crowd that put their records, if any, in a suitcase and carried them out of town when the accountants presented themselves to make the audit.) Advance from the Bank of North Dakota, $211,795.40.

The Equity Packing Company, of West Fargo, had an operating deficit of $771,216.67 according to reports given out at its annual meeting, January 21. Luckily, it appears that the capital of this experiment has been practically subscribed. About $2,000,000 has been paid in and the principal asset is a packing plant appraised at $1,248,418.05. This is a modern plant plan the deficit about balances the capital. The plant handled 2,203 cars of stock during 1920. Actual stock killed was given as 15,-000 cattle, 6,500 calves, 49,000 hogs and 5,700 sheep, the remainder being shipped to St. Paul.

In its issue of February 12 this paper printed the official statement of the Bank of North Dakota as of January 26, which showed total assets of $15,926,725.24. As the writer has since come into possession of the independent accountants' report, the latter is given here, with a comparison with the former. While the dates of the two statements vary by 54 days, the items, particularly earnings in connection with accruals, make an interesting comparison.

		$ 1,081,831.42
Interest Paid	$ 667,362.10	
Salaries	142,894.15	
Printing and Stationery Supplies	4,776.39	
Postage	2,446.63	
Fuel and Rent	11,751.13	
Depreciation	9,845.37	
Advertising and Sub's	5,535.05	
Traveling Expense	5,317.33	
Ins. and Surety Bonds	4,472.45	
Miscellaneous	4,662.39	
	901,160.65	
Carried to Surplus	$ 180,335.37	

Owing to the fact that the bank was started without any capital, it is difficult to figure out whether net book earnings of $180,335.57 for the fourteen months is a reasonable, profitable or unduly low. Average deposits of the institution have run somewhere between $15,000,000 and $20,000,000, and in Michigan it would not be unreasonable to expect a bank of, say, $18,-000,000 deposits to earn 15 per cent per annum on $1,000,000 capital, which would be $237,500 for nineteen months. One hundred and eighty thousand, three hundred and thirty-five dollars and fifty-seven cents for nineteen months would figure out a trifle less than $10,000 a month or at the rate of about 10 per cent on $1,000,000 capital. Assuming that the nominal capital, (represented by bonds which did not sell,) of $2,000,000 were paid in, the net earnings would be about 5 per cent. But as stated previously the lending power of the bank arose almost solely from public deposits. Moreover, it must be borne in mind that the $10,000 a month given in the foregoing merely represent the book value of the invested assets, the real value being a problematical figure.

In the detailed statements which follow, it will be noted that more than $900,000 was loaned or deposited with banks that have closed, and undoubtedly this sum will be partly lost. Then the loans to the state elevator and flour mill are of questionable value, and the Merchants Loan & Trust Company, Chicago, will have to be paid $1,000,000 that it loaned the Bank of North Dakota on $1,200,000 of bank series bonds as collateral. So that, all told, it is conservatively estimated that the taxpayers will have to foot a hill of more than $5,000,000 to wipe out the losses incidental to winding up the Bank of North Dakota; or, if it is reorganized into a rural credit bank, a similar sum will have to be raised to clean up the situation.

As a matter of interest, there is appended a partial list of banks, showing their capital and surplus in the first column, and in the second column the amount of money listed as "total liability") either loaned to or deposited with each by the Bank of North Dakota. Note particularly the First State Bank, Kioten, of which State Examiner Lofthus, was directing head when he was appointed state supervisor of banks. Also the Williams County State Bank, Williston. It is stated in nearly every instance where the deposits and loans were in excess of prudent limits that the banks so favored are controlled or managed by friends of Townley.

	Capital Surplus	Total Liabilities
Bank and Town—		
Slope County State, Amidon	$ 15,000	$ 15,589.20

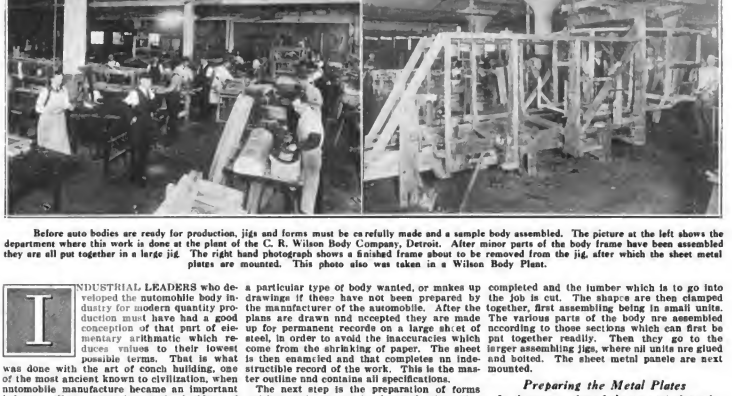
MUCH IMPROVEMENT IN LANSING

Lansing's automotive plants are rapidly getting back toward normalcy. The Reo Motor Car Company is employing 4,500, or practically the full force, 35 per cent on full time and the remainder on less. The Olds Motor Works has increased its force in 60 days from 700 to 1,400, who are working full time, 10 hours a day. The Duplex Truck Company is operating full time but with limited production. Manager Charles Smith, of the Ideal Power Lawn Mower Company and Ideal Engine Company, reports these plants working on a 100 per cent basis. Hugh Lyons & Company report a force of 195 employes. The Motor Wheel Corporation, Michigan Screw Company and Auto Body Company report goodly increases in the number employed, with more expected to be added during March. The Atlas Drop Forge Company is on an 80 per cent basis; the Ryan-Bohn Foundry is making good progress with 65 employed, and the Gerson-Carey Company expects to be back to normal soon if the present gains continue.



MOVING TO TRAVERSE CITY

The Worth Transportation & Products Company, Hammond, Ind., is loading its plant equipment preparatory to removing to Traverse City, Mich. The company, which is capitalized at $10,000,000, manufactures railway equipment. It formerly was known as the Railway Motor Car Company of America.

How Motor Bodies Are Made

A Description of the Processes Usually Employed; Fifty Plants Embraced in This Michigan Industry

Before auto bodies are ready for production, jigs and forms must be carefully made and a sample body assembled. The picture at the left shows the department where this work is done at the plant of the C. R. Wilson Body Company, Detroit. After minor parts of the body frame have been assembled they are all put together in a large jig. The right hand photograph shows a finished frame about to be removed from the jig, after which the sheet metal plates are mounted. This photo also was taken in a Wilson Body Plant.

INDUSTRIAL LEADERS who developed the automobile body industry for modern quantity production must have had a good conception of that part of elementary arithmatic which reduces values to their lowest possible terms. That is what was done with the art of conch building, one of the most ancient known to civilization, when automobile manufacture became an important industry. Every operation in the building of a fine conch body was separated from its fellows and analyzed as an individual operation; the requirements were made the basis of various departmental activities, and specialists were trained to perform each of the several operations, which in other times were learned only after many years of apprenticeship by a master craftsman.

The modern system has as much to commend it as ever had the ancient, although the two schools of production have little in common. What the modern automobile body loses in atmosphere which machinery cannot give, it makes up in sturdiness, practicality, economy and added utility.

Fifty Plants in Michigan

Michigan has about 50 plants devoted to the production of automotive bodies of all classes and types. These include the body for passenger automobiles, constructed of wood framework under sheet metal plates and panels stamped to shape and size; the metal body, the truck body of heavy steel construction; the frame truck body for general hauling purposes and the special body for all types of trucking operations, the driving cabs for trucks and the special passenger body. A great industry within an industry has thus been developed which has taken into itself much that manufacturing practice has developed.

Perhaps the best idea of the processes in auto body production can be obtained by following one of them right through a plant. The draughting room sees the first blue prints of a particular type of body wanted, or makes up drawings if these have not been prepared by the manufacturer of the automobile. After the plans are drawn and accepted they are made up for permanent records on a large sheet of steel, in order to avoid the inaccuracies which come from the shrinking of paper. The sheet is then enameled and that completes an indestructible record of the work. This is the master outline and contains all specifications.

The next step is the preparation of forms and layouts in preparation for production. This is slow and careful work, requiring the utmost skill and special machinery. Dies and jigs are made up for production and the experimental department then prepares a body for final acceptance, prior to quantity output. This preparatory work sometimes consumes many weeks, when exceptional results or departures from standard design are demanded.

The experimental departments of some of the large body plants contain sufficient interesting material for description to consume much space by themselves. It is here that new body lines are created, new ideas worked out and accepted, revised or rejected. Most of this kind of work is done by taking a rude framework of a body and filling it in with plaster or clay and shaping it to the effect desired. Sometimes it is a search for a new line to meet the seasonal demands of a manufacturer; then again it may be that someone has designed a better type of windshield or a window or a door, and in order to make the improved model show to best advantage it is necessary to make certain minor or perhaps radical changes to meet the requirement.

One automobile body plant visited was working on a windshield that was of an improved weatherproof type, which kept rain and cold out from the corners and edges of the glass. It meant a change in the finish of the entire front of the body. This change was engaging the ingenuity and ingeniousness of several skilled workers.

The forms and jigs which are made up preparatory to production on a body are carefully completed and the lumber which is to go into the job is cut. The shapes are then clamped together, first assembling being in small units. The various parts of the body are assembled according to those sections which can first be put together readily. Then they go to the larger assembling jigs, where all units are glued and bolted. The sheet metal panels are next mounted.

Preparing the Metal Plates

In the preparation of sheet metal plates for bodies large presses are used because of the size of the sections that must be stamped out. Bliss, Toledo and Cleveland presses form the stamping equipment for most of the body plants in Michigan. Dies are made for these presses according to requirements, usually in the shops where the stamping is done. This practice is followed generally throughout the large body plants such as C. R. Wilson Body Company, Briggs Manufacturing Company, Fisher Body Corporation and others. Sheets are fed to the workmen by overhead cranes and carried off by shop trucks or conveyors.

The stamped-out parts are next welded together by acetylene process and then mounted on the previously assembled frames. In the fabrication of these several units, everything is considered, to the placing of perforations where bolts or nails are to go, so that once the parts leave the mill there is a very rapid transition to the finished product.

Inspection is the backbone of body manufacture. It begins with the lumber which goes to the body plant's mill. It passes on the jigs and dies; it examines the plates as they are prepared for mounting; it looks to the assembly to see that there are no corners, breaks of wooden sections split by bolts, or faulty sections anywhere. It sees that the workmen have not overlooked anything, and that in all cases the stringent task to which the product is to be applied is met with sturdiness and honest construction. The inspection in the modern

The Investor's Obligation To the Agricultural Industry

That Obligation Lies in Financing the Manufacture of Farm Equipment That Is An Asset, Not a Liability

AT PRESENT a great deal is being said about constructive agricultural policies that will be fair to the people as well as to the farmer. These are legislative problems, but what are needed as well are proper cooperative policies between the investing public and the farmer and to see that they are aggressively carried out.

How much real thought do the people, especially those in the cities, give to the farmer, his troubles or his profits and losses? At the same time most people certainly must realize that all of their food and clothing must come from the farm and through the farmer's efforts and ability to produce. At present he is making the effort but his ability to deliver is being sorely handicapped by the very people he is trying to feed and clothe. It might be said that he is doing it for a profit. So he is, tryling to at least, but every man is worthy of his hire.

Let us look at the farmer from another point of view, as a manufacturer (producer). If the city manufacturer wakes up to realize that he is not making the proper percentage of profits above his costs, to warrant his continuing to produce, he will naturally close down his establishment or curtail his output until his idea of profits is satisfied. This the farmer cannot do. His manufacturing process is more than half completed when he plants his crop, and he has expended at least 50 per cent of his manufacturing costs up to that point. He starts his process when he starts plowing, without the least assurance that there is a dollar of profit ahead of him, or a guarantee that his entire efforts will not result in loss. Then there is the long wait between seeding and harvest time, in which he hopes for the best in quantity and quality. How much of his crop he will secure on account of labor conditions is problematic, and what price he will obtain is a gamble, due to city speculative influence. Should he decide to curtail his output or fail to seed after a season's loss, the country would be facing a famine which would bring about a financial panic and then the city manufacturer would have little need to produce. The farmer can always raise enough food for his own immediate needs, but the city man cannot; therefore, as the city's welfare depends on the farmer's success, **there should be full and helpful co-operation between the city and the farm country.**

The Farm Labor Problem

Profits are due the farmer as well as the city manufacturer but at present the farmer is suffering for the co-operation which would co-ordinate the interests of both. Labor shortage makes crop costs too high and the farmer will continue to suffer until more liberal feelings are inducted into the relations of the city to the farm country. So long as the city places a premium on luxuries over the production of the staples of life, it will give little heed to the producer of those staples and investors will pay little attention to the real requirements of the farm. As to the farmer's ability to produce, the following quotation from the Manufacturer's Record is couched in plain language:

"Today the factories are robbing the farm. There is no equality of attraction in wages or hours. Men who labor and sweat much in the open fields can make far more money by laboring little and sweating less in manufacturing establishments. So they go to the factory. The drain is a steady one, so steady that already it threatens the nation with an absolute food shortage. As a people we are getting perilously near the rocks and we are going to run afoul of them unless we turn honest and give the toiler in the fields a fair show."

The above statements declare the essence of most of the difficulties met with on the farm today. As labor is the question at issue, and will be the issue more so each year, there apparently is but one means of mastering the difficulty, and that is to encourage as far as possible—and possible has no limit here—the manufacture of power-driven labor-saving equipment for the farm. Any farm well equipped with power-driven machinery will have no difficulty in getting a full complement of operatives, as such devices will have a tendency to keep enough of the young men on the farm, and keep them interested. For instance, there is pleasure, not drudgery, to the farm hand who can sit comfortably on a seat with his hands upon the steering wheel of a tractor and be able to plow 10 or 12 acres a day instead of two and a half to three acres with horses, after which he has to trudge along, on foot, near a dog in the mud. Some idea of such walking may be realized from the fact that to plow only one acre a fourteen-inch bottom plow has to travel seven miles, which affords the horse-plowman the joy of a seven-teen and a half mile promenade to plow two and a half acres in a day.

Many men who are now manufacturers, or interested in financial circles, were farmers or labored on their fathers' farms in their younger days, can recall the hardships of those days resulting from either poor help or no help at all. The principal motive power for handling tillage implements and harvesting machinery then was horseflesh, and today on the majority of farms it is horseflesh. The advantage is on the side of the man who has motorized his farm and to him fall the benefits of increased production at less cost. Larger production at lower cost means greater profits to the farmer, and tractorizing the farm stabilizes costs. Determinable costs relieve producers of fear and stimulate production. The manufacturer increases his production when he can lower his costs by installing greater production machinery at less labor. It is also on the farm. The manufacturer must create a demand for his product, wherein the demand is universal for farm products.

Just now it seems untimely to talk greater production to the farmer, owing to the great surplus crops that are not moving, but this is due, as everyone knows, to the fall-down in export resulting from delayed action in our capital. At the same time some Asiatic and European countries are dying for lack of the grain that is stored in this country's elevators. The reason, as stated above, for the glut in harvested crops is not only apparent but is a fact, and affects cotton as well as cereals. Therefore, in view of this fact, this is the time to talk and boost production, even intensive production, due to conditions abroad. Countries that have suffered starvation and famine will be making the greatest possible demands on this country and Canada for cereals. They will not be buying for immediate needs only but will be filling their storehouses to anticipate emergencies beyond what is possible for them to grow themselves; and it behooves this country to fortify itself against drought, as such a thing as crop failure has happened here and may happen again. Therefore, produce. Export will pay the price.

Inventive genius has given to the world the means of lower costs of living.

In 1831, Cyrus Hall McCormick invented the first reaper and tested it in a field of grain, the same year, near Steel's Tavern, Va. Before that time all grain was harvested with the cycle, scythe or cradle in the hands of a sweltering farmer.

The basic principle of McCormick's invention has been the base from which all later developments in harvesting machines emanated. This machine may be considered the source from which the great grain wealth of the world was developed, and from that beginning was instituted the greatest farm machinery manufacturing establishment in the world. If it had not been for this development in harvesting machinery, our Western states—grain belt—would be a wilderness today, and Canada would be more so.

The Tractor Comes

There is in use at present, on a mild scale, a device that is of inestimable value to the farmer, not in this country only but in all countries, not only for operating present farm lands but opening and breaking-in new lands in unpopulated districts, even to the jungle fastnesses of Africa. That device is the tractor.

It is about 30 years since the first steam tractor appeared in the West. They were ponderous affairs having driving wheels seven or eight feet high. In the immense grain belts it was very difficult to supply and feed the monsters with sufficient water and fuel, so much so that many schemes were applied to burn the waste straw, with more or less success. The coming of the automobile and the quick development of gas and oil motors, with their cheap and convenient fuel, started a revolutionary movement in tractor design, to the extent that the change to the combustion-motor equipped tractor is now complete.

A great deal has been and remains to be said about the tractor in its uses and abuses; its good points and—well, the excuses that have been commercialized. There are many different makes of tractors in the field, many good and others not so good. Unfortunately, when a demand is created for a certain device it attracts many manufacturers endowed with stronger commercial instincts than with good intentions to serve, and they get into the market with something that can be sold by advertising. Everyone has heard about "wooden nutmegs." Simply hitching four wheels to a frame to carry an engine and transmission might satisfy a dictionary definition of a tractor; and, if the contraption is painted up in attractive colors, might please the farmer while

THE author of this article is a Michigan engineer whose advice has been sought by many before making investments. He is now retired from practice and has spent some years in the development of tractors and agricultural machinery.

Digitized by Google

making the purchase, but when he starts plowing he has to call on the stuff that is under the paint, and then he calls for the service man and repairs. What is the result? Why, he condemns the whole tractor idea. Such a farmer has been placed in a position to be pitied, as he may be a small operator who has expended his entire savings on such a machine, to find that he has been "stung."

Some Tractor Mistakes

Any person who will give the tractor a thought will realize that it is subjected to harder usage and more careless handling than a railroad locomotive, and that it should be designed and built accordingly.

There has been a tendency—and it has been augmented by the purely commercial manufacturer, who figures his main profits on the sale of repair parts—to decrease the size and weight, and consequently the service capacity, of the tractor, and the market is flooded with what might be called "Farmer's Delight" machines. The idea, of course, is to get the small operator while the fever is high and the getting is good, but it means more to the purchaser than merely buying such a machine; it means, in a short time, the purchase of innumerable repair parts, and loss of time from the machine's being in the repair shop more than it is on the farm at actual work, which is costly and disappointing.

Let us look at the "Farmer's Delight" type of tractor, first, from the selling standpoint. It is light; it costs less (first cost) than a real tractor; just the thing for the ordinary farmer; can turn in a small circle; burns everything; is guaranteed for (some) months; then joy and profits for the "service man" and incidentally to the manufacturer who had the farmer's interest at heart, so much that he almost gave the machine to him. But—the poor farmer keeps on paying the freight.

Now for the efficiency of such a machine. Can it keep its equilibrium in side-hill plowing? Is it capable of actually pulling the number of plows and size of plows as rated in the multi-colored advertising matter? While plowing can it pull soil crushers or harrows? No. Well then it is compelled to make several trips over the ground to prepare and plant the seed bed. Then is such a machine a time and money-saver, or just a trouble-maker? Ask the farmer who owns one. A farmer naturally takes pride in becoming the owner of a tractor but in some cases the tractor manufacturer becomes the owner of the farmer, as the farmer, having his all tied up in the machine, keeps on buying repairs through his efforts to get his money back.

Would it not be a good idea for the tractor manufacturers—who are filled with so much "brotherly love" that they make a cheap machine and almost give it to the farmer—to keeps on buying repairs through his efforts publish a repair parts list, showing the price of each part, the total of all the prices to equal the price of a complete machine plus the freight, and make such list a part of the contract? Such a thing would not be done, because it would deprive the philanthropic manufacturer of several hundred per cent profit. The manufacturer who will turn out a properly designed and well constructed machine will be satisfied with his first profits, as his machines will sell on merit and repair parts will be considered maintenance factors, not profitable break-down features.

Properly Designed Tractors

The heavier, properly designed and constructed machine has the capacity and stamina to prepare the seed bed at one trip; saves labor and fuel expense; has plenty of reserve engine power; can deliver ample belt power to all the requirements of the farm, and the capacity is such as to finish its owner's work so promptly that he can turn to and do his neighbor's work at a handsome profit per acre and pay for his machine quickly and change

Organization

The essential machinery of business is competent organization. This means the selection of human beings endowed with intelligence, suited to their work, and equipped with a System functioning at all times along straight lines.

Under proper organization System is the simple, direct means to perfect functioning —economic and progressive.

Business today suffers from too much red tape. And System is blamed. The fault lies not in System but in its application.

System, to be wholly successful, must be applied with METHOD in the hands of a competent organization—trained human beings fitted to and interested in their work.

Long experience in the building of competent organizations and the application of System, based on facts and figures, is the definite service rendered by the

Banking and Foreign Trade

A Review of the Experience of European Capital In Financing Commerce; the Lesson for America

By EDMUND D. FISHER

An address before the Commerce Club of the University of Michigan, Ann Arbor, March 1, 1921.

THE UNITED STATES, after nearly a century and a half of political independence, has finally become a creditor nation and apparently is secure in its present position of financial independence. This situation, however, is largely technical; has been brought about by the war necessities of other nations and the enormous but temporary increase of its export trade, much of which has had no basis of continuing value either to the seller or to the buyer. The problem of stabilizing international finance and trade relations is yet to be solved. Competition with other nations of more experience and with well established overseas agencies and connections will tend to reduce the present volume of export trade unless new plans that have been formulated are developed.

The extension of foreign trade along sound lines is necessary to the commercial and industrial stability and development of the United States. The division of labor, the diversification of climate, the varying aptitudes of peoples make commercial inter-dependence both necessary and desirable. No nation can safely assume a position that tends to isolate it from world commerce.

Investment of Capital Fundamental

The successful trading countries of Europe, however, such as England, France, Holland and Belgium, have learned through centuries of experience that the outposts of trade must be established through the investment of capital. The foundation of British commerce grew out of initial investments in numerous trading companies. The East India Company has given her the trade of an empire. The Muscovy Company settled Archangel and developed trade with Russia. Most of the larger enterprises of exploration, settlement and trade in the New World were supported by chartered companies. The Elizabethan era was characterized by numerous corporations for overseas finance and trade. Such were the Eastland Company (1578), the Hamburg Company (1564), the Spanish Company (1574), and the Turkey Company (1581), which later became the Levant Company, aiming to reach the spice merchants by the way of Bagdad and the Persian Gulf. The great East India Company was incorporated in 1600 and the China Company followed in 1604. The Virginia Company was organized in 1606. An appeal to go on the "Virginia Voyage" began—

> "You have heroic minds,
> Worthy your country's name
> That honor still pursues;
> Whilst loitering hinds
> Lurk here at home with shame
> Go, and subdue."

Courage to invest capital to develop foreign trade did not seem to be lacking, but apparently the spirit for personal adventure had to be stimulated.

The fields for commerce are, of course, well established. Exploration and settlement are no longer important factors to be considered. Owing to the losses in the World War, however, and the dislocation of trade relations, capital for the maintenance and development of our export trade is most necessary. Under the normal conditions of a balanced trade, imports will finance exports. In other words, there is merely an exchange of goods. Now that so many nations have a reduced exporting ability, we must consider the import of securities in payment for our goods. To put it in another way, we must grant long-time credits. Thus a problem is presented to the bankers and producers of the country that in some of its aspects is new in American finance.

European countries, as large exporters of capital, have had quite a definite experience in granting long-time credits. The foreign investments in 1914 of some of the principal nations were as follows:

Great Britain	$21,000,000,000
France	10,000,000,000
Germany	8,000,000,000
United States	800,000,000

It is thus clear that with but $800,000,000 of foreign investments in 1914, the United States has had but little experience with long-time credits, and it is also clear that to take a commanding place in the continuing commerce of the world, she must proceed with courage and do her fair share in granting such credits.

Such a policy, furthermore, will have very vital present and future advantages, for the United States has a productive ability far in excess of its domestic demands.

Loans of a similar character to those made by Europe, made through American banking concerns should, of course, be followed by the expenditure of the money for American products, thus establishing the basis for developing a continuing trade along normal lines of export and import.

Methods of Financing Abroad

European banking practice has developed two systems of financing long-time credits which may be characterized as the English and the German methods. In England, although some issues of securities are placed directly with the investor by the private bankers, as is the custom in all large financial centers, many of the foreign loans are placed through the medium of the "investment trusts." These cover investments issued by nations and municipalities as well as by public utility corporations and those doing business along approved industrial lines.

The well managed investment trust diversifies its investments with usually not more than 5 per cent of any one kind. Against its investments the trust corporation issues its own notes or debentures. The ultimate investor thus has a security of high quality with diversified risk and with the additional backing of the capital and surplus of the investment company. Typical companies are the investment Trust Corporation, Ltd., London; the Metropolitan Trust Company, Ltd., London, and the Second Edinburgh Investment Trust, Ltd., Scotland. The best managed of the investment corporations have averaged dividends of over 12 per cent for a long period of years.

The English banks mainly confine themselves to the short-time financing of foreign trade through the medium of acceptances and commercial bills. The ramifications of their business, of course, extend to all parts of the earth.

The great German banks, on the other hand, usually combine the functions of financing both short-time and long-time credits. They are both depository banks and investment houses. They underwrite issues, own and distribute the securities and through ownership or affiliation control banking and industrial corporations in various parts of the world. This plan, although having certain elements of danger if too large a volume of fixed credits is held, has been generally successful. It has given a quality of control which in co-operation with the government, before the war, developed a tremendous overseas trade. German-owned banks and other corporations in various countries gave the home banks a wealth of credit and economic information for the furtherance of German commerce.

The writer in 1914 (fortunately early in the year) presented a letter of introduction to the "Secretary of the Archives" of the Deutcher Bank. He was shown a veritable library with its steel stacks in which was collated in various forms material from all parts of the world on subjects as well as the usual credit information, covering particularly financial and economic

New Plans for Trade Extension

The United States, as has been stated, now has to compete in foreign trade with countries well organized for overseas commerce, with years of experience and with well established connections. Two important steps have been taken to make its efforts effective. The Webb law makes legally possible the association of concerns, which though competing for domestic business, may unite to compete as a unit for foreign trade. This plan not only reduces costs through smaller sales organizations, but makes it possible to compete on an equal footing with similar organizations in other countries (as the German cartel) as well as to standardize American goods.

More important, perhaps, has been the passage of the Edge bill, an amendment to the Federal Reserve Act, which provides for the incorporation of companies to finance overseas trade particularly through the extension of long-time credit and the local issue of debentures.

Under the leadership of John H. McHugh, vice-president of the Mechanics and Metals National Bank, New York, acting for a committee of the American Bankers' Association, the Foreign Trade Financing Corporation has been incorporated and is now in process of organization. It will have a capital of $100,000,000 and may issue debentures to the extent of $1,000,000,000. This corporation should be a very vital factor in maintaining and developing our export trade, so necessary to every interest in the country.

The farmer, the wage-earner, the merchant, the manufacturer and the banker will receive many benefits from this type of company, for there is an economic advantage in a maximum rather then a minimum production. Labor is more fully employed. Prices tend to be more stable both through the enlarged purchasing power of the people and the broader markets developed. The morale from full employment makes more contented citizens and more efficient workers. An increased export ability would develop under such conditions which would easily absorb the debentures as they were issued.

The nation as a whole would thus have a savings account, a reserve fund for the great future. Such a fund, the $21,000,000,000 of foreign investments (1914) saved England in her time of need, and the connections established with the borrowers have given and will continue to give her, in a measure, the control of a continuing commerce.

A New Source of Funds for Highway Extension

To the Editor:

THERE are two articles in your issue of February 26 which have a very close relationship, and from which a lesson is obvious to the careful reader. The article, "The Legislature and the Trucks," calls attention to the injustice of penalizing the commercial trucks because of injury done to an inadequately constructed road in Monroe county, by heavily loaded trucks. This article emphasizes the desirability of properly constructed roads suitable for this improved system of transportation, rather than a special penalty on truck owners. The article, however, makes no suggestion as to the proper method of paying for the construction of roads adequate for heavy trucks.

A suggestion as to the proper source of funds to pay for such roads is contained in the article entitled "How Motor Trucks Add to Value of Farm Lands." The statement is made therein that in Hinds county, Mississippi, the building of roads adequate for motor trucks raised farm land values from $25 an acre to $100 and $125 an acre. The writer questions whether this four to five-fold increase in value is entirely due to good roads and the motor truck transportation which was made possible thereby. Probably about half of the increase in price per acre is due rather to the general decrease of 50 per cent in the value—that is, the purchasing price of the dollar, as shown in the index number of commodity prices; but even so, the balance would indicate that there was an actual increase of from $37.50 to $50 per acre directly traceable to the construction of the roads.

Undoubtedly also, the increase in land values due to the building of the good roads in Hinds county was not limited to contiguous farm lands. Doubtless there was even a more noticeable increase in the value of land at the business centers from which these good roads radiate. Would it not be common sense, as well as justice, therefore, to pay for the good roads out of a tax on the land values produced by the construction of such roads, rather than by a tax on the trucks?

The value of the trucks is not increased one cent by good roads. On the contrary, the value of the trucks, determined by their selling prices, tends to go down as the mileage of good roads increases. The greater the mileage of good roads, the greater is the demand for trucks; and a greater demand for trucks makes possible a decreased cost of manufacturing trucks, and consequently a lower price. Cheap transportation is greatly to be desired. It is obtainable by paying for the highway on which the trucks can be operated by a tax on the land values produced by the highway. On the contrary, a tax on the trucks is added to the cost of transportation, and all of the benefits of the improved system of transportation tend to be absorbed by the land owners who get something for nothing, at the expense of the consumers of commodities transported by the trucks.

Is there any fallacy in the foregoing statement? If so, where?

WARREN S. BLAUVELT,
President, Indiana Coke & Gas Co.,
Terre Haute, Ind.

FARM LABOR DEMAND GROWS

According to replies to an inquiry being received by the Michigan State Farm Bureau, the demand for farm labor this year will be even greater than last year despite the drop in prices of farm products. However, the wages paid will be somewhat lower, varying from $25 to $45 a month with board, to $75 without.

LABELING BILL PROTESTED

Representatives of Michigan manufacturers at a hearing before the House committee on state affairs at Lansing have protested against the bill of Rep. Walter A. Heinzie requiring labels on products of goods sold in this state. It was declared the act would discriminate against Michigan manufacturers in favor of mail order and outside merchandise.

17,905 PUT TO WORK

The monthly statement issued by the Employers' Association of Detroit, late last week, says that during February 17,905 men were added to the payrolls of 79 factories in the city. Of the 62,787 men now employed, 21,357 are working full time and the remainder, employed in 40 shops, are working an average of 36½ hours a week. The total working force in Detroit plants is approximately 95,000, the report says.

FEBRUARY SHIPMENTS

Reports to the National Automobile Chamber of Commerce indicate that during February 9,400 carloads and 6,700 driveaways left the factories. This means that deliveries for the month were about 50 per cent greater than for January and about one-third of those for February, 1920, when shipments totaled 25,505 carloads and 43,719 driveaways.

Creating a Copper Market

Bill Introduced in Legislature Would Permit Producers to Fabricate the Metal They Mine

By L. D. TUCKER

THE BILL to permit mining companies to manufacture articles from their output, as framed by Rep. Miller and introduced into the Michigan Legislature, Monday, February 28, is looked upon by upper Michigan's industrial interests—particularly the copper mining men—as one of the most vital issues pertaining to that region's economic progress that has ever been placed before the law makers. The measure is designed "to afford relief from depression in the copper market such as now exists, and which has resulted in a sharp curtailment of operations in upper Michigan mines and a surplus of 150,000,000 pounds of copper."

"I know that, generally, sentiment is against permitting a corporation organized for one thing to engage in another business," says Mr. Miller, "but something has to be done, as the condition is becoming serious.

"Upper Michigan produces virgin copper. The mining cost is somewhat higher than with the ore smelting mines of the West, and when lack of demand forces prices below a certain point, the Lake Superior copper companies have to quit. If the companies went into the manufacturing business in poor times, they could continue mining for a somewhat longer period, as manufacture by themselves would absorb a certain amount of loss in mining."

It is a fact that 25 copper mines in Michigan are now closed down entirely, while those that are operating are running at about 20 per cent of normal. It is a condition never before paralleled in the copper country—a region which, since the discovery of copper in 1834 up to the signing of the Armistice, had produced one-sixth of the nation's output of copper ore of the highest grade obtainable.

The question naturally arising from such a proposal is: Is upper Michigan equipped advantageously to carry on the manufacture and sale of its raw product? Those who are now engaged in that industry; those of upper Michigan's lifelong residents who have closely followed the progress of copper mining and have made it a study, as well as expert engineers from outside the peninsula who have surveyed the situation and reported upon it, say that the region is amply endowed by nature with the facilities which would make the manufacture of copper equipments an ideal industry for upper Michigan.

As for railroad, waterway and highway transportation facilities, upper Michigan is more advantageously equipped, probably, that any other copper-producing region in the country. With its hundreds of miles of shore line on the Great Lakes, its adequate and thorough system of railways and its 1,500 or more miles of macadamized trunk highways, reaching out to the main trunk lines of Wisconsin, Illinois, Minnesota and other middle-western sections, there is no shortage of channels through which to ship the finished product.

Upper Michigan, though a region of which comparatively little has been told, and learned, is rapidly coming into prominence for its unusual industrial features and its increasing rate of economic progress.

The Upper Peninsula has more wage earners than the combined states of Wyoming, Nevada, South Dakota, North Dakota, Idaho, Arizona and Delaware. Nearly one-third of all the iron ore and approximately one-sixth of all the copper produced in the United States are mined in upper Michigan. The lumber products of the Upper Peninsula are equal to the lumber products of Wisconsin, Pennsylvania, California, Minnesota, Illinois or Mississippi. The Upper Peninsula has a thousand miles of coast line, and water power at Sault Ste. Marie second only to the great falls of Niagara. There is not a city in Arizona, Nevada, New Mexico or Wyoming as large as Escanaba. There is not a city in Vermont, Wyoming, New Mexico, Nevada, Mississippi, Arizona, North Dakota or South Dakota as large as Calumet. The Upper Peninsula has more public schools than Rhode Island, Delaware, Wyoming, Nevada, New Mexico, Arizona or Utah, and spends more for these public schools than is spent in New Hampshire, Vermont, Rhode Island, Delaware, Wyoming, New Mexico, Arizona or Nevada. In these public schools there are more pupils enrolled than in Delaware, Wyoming, New Mexico, Arizona or Nevada.

The Upper Peninsula pays a larger corporation tax to the federal government than is paid by Arizona, Arkansas, Florida, Idaho, Mississippi, Montana, New Hampshire, North Dakota, South Carolina, Vermont or Wyoming. The per capita wealth in the Upper Peninsula is greater than the per capita wealth in Arkansas, Colorado, Nebraska, New Hampshire, Vermont and all the southern states. There are more than 75 banks in the Upper Peninsula and the savings deposits of these are greater than all the savings deposits in Delaware, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Mississippi, Louisiana, Kentucky, Tennessee, Indiana, Kansas, Montana, Maryland, Colorado, Washington or Oregon. The average deposit of each depositor in the Upper Peninsula is greater than the average in eighteen other states.

Here, then, are just a few facts in support of the contention of upper Michigan's industrial interests that the region is amply equipped to add copper manufacturing to its list of achievements. Upper Michigan's advantageous natural endowment as pertains to virgin timber already has established the region as ideal for the location of woodenware factories, chemical plants, iron furnaces and other features utilizing the wood, or wood products. These industries are rapidly increasing each year.

It is naturally with a great amount of interest that upper Michigan's pioneer citizens and established industries look to the outcome of Rep. Miller's measure. It is a matter of importance more important to the region than can now be fully realized, and the rapid progress of the lakes-to-ocean movement, which would open the Great Lakes country and upper Michigan's copper areas to the seaports of the world, only serve to magnify the project. It is looked upon, further, as determining the life and growth or decline and disuse, of upper Michigan's natural resource in copper.

In the past, upper Michigan has sent its copper to Connecticut, Pennsylvania and other copper manufacturing districts throughout the country. The raw product has come back in the form of wire, copper tubing and other equipment, plus the hundred and one assessments and taxes heaped upon it during the process of shipment, manufacture and re-shipment. In other words, upper Michigan pays double and treble for the article manufactured from the raw product which the region itself produces. It is not a fair nor reasonable order of things, and it is not entirely necessary nor mandatory that this condition need exist in the future. Hence Representative Miller's measure.

Reo Motor Car Co. Wins The Barber Patent Suit

The Reo Motor Car Company, Lansing, has just won an important patent case, a decision having been rendered in its favor which, it is said, will have a far reaching effect not only for the company, but for the industry as a whole. The case, which has been in the courts nearly six years, was the one of Barber vs. the Otis Motor Sales Company, Utica, N. Y. Reo distributor, and the decision was rendered by the United States Circuit Court of Appeals. The litigation was over the priority rights to a valve seated in a cage, which later was screwed into the cylinder head and was removable by swinging the push rod aside. Horace T. Thomas, vice-president and chief engineer of Reo, says about the decision:

"The usual process in such cases is to apply for a patent on some device or part of a motor car, then let it stand unissued for an indefinite period while the applicant amends his claims from time to time, taking advantage of the discoveries and progress made by others.

"The most difficult obstacle to surmount in this Barber suit was the fact that a prominent automobile manufacturer against which Barber had brought suit prior to his attack on Reo, settled for $4,000 and thereby gave a tacit recognition to the validity of Barber's claims. That in their earlier decisions the lower courts must have been influenced by this, we felt sure.

"In legal terms the case may be summed up as follows for the benefit of those who are interested in its technical phase: In 1915 William Barber, alleging an infringement on his patent for valve gear by the Reo mechanism, brought suit against the Otis Motor Sales Company, Reo distributor at Utica, N. Y., and won the case under such circumstances that he claimed the decree of the federal court of that district was also binding upon the home corporation at Lansing. That decree was affirmed by the United States Circuit Court of Appeals which, except in rare instances, is the court of last resort in patent cases. Not content with this double victory, Barber then started suit against the Reo Motor Car Company of New York, evidently thinking it the parent concern, whereas it is a separate and only a sales organization. In this case he sought an injunction against the exhibition of Reo cars at the New York Automobile Show in 1917, the suit being filed just prior to the opening of the Show. At about the same time a similar suit was instituted in the federal courts of Michigan against the Reo Motor Car Company, Lansing—the manufacturer.

"In these steps Barber made his mistake, for the New York city suit was decided against him and the Michigan suit was deferred, pending the outcome of the litigation in the East. Although the claims made by Barber in all these suits were the same, the defense in the New York case was along an entirely different line from that in the Utica case. In view of the apparent conflict between two federal courts in New York state, the court of appeals, upon request of the defendants, sent the Utica case back for a new trial.

"The new trial took place in January, 1918, and some two years later, in May, 1920, the federal court at Utica again sustained the Barber patent. The defendant again appealed, and in view of the new evidence furnished by the Reo Motor Car Company, none of which had been before any higher court on the former appeal, the Circuit Court of Appeals has just decided not only that Reo mechanism does not infringe the Barber patent but that patent itself is invalid.

"There being no appeal possible from that decree, the litigation is probably now at an end, for the only case still in court is the Michigan suit against the Reo Motor Car Company, Lansing, which doubtless will be dismissed."

When purchasing cutters, bear in mind that —

BROWN&SHARPE

Carbon & High Speed Steel

CUTTERS

Give highest returns per dollar invested.

B&S cutters are the result of fifty years' experience in the manufacture and use of milling cutters. The shops around you will insist that B&S cutters give longest service and reach the maximum of Cutter Economy. They know from experience.

FORD REACHES 2,000 MARK

This paper has been advised officially that on March 2 the Ford Motor Company produced 2,070 cars. Assurance was given that the 2,000-a-day mark was then not exceptional but was about the general average, and it was further said that the company expected to build and ship 60,000 cars in March.

"You may say that the sale of Ford cars is increasing in a satisfactory way and that the best evidence that our business is picking up is to be found in the many orders for trainload shipments from dealers in different parts of the country," said the official. "We do not want to appear too optimistic but we feel confident that automobile sales will continue steadily to grow. I believe there will be a shortage of Ford cars this year."

HAYES ALBION PLANT RESUMES

The Hayes Wheel Company's plant in Albion, which had been idle since November, reopened last week and expects to be on a 50 per cent basis by the end of the month. Normally, 500 men are employed. The reopening was made with about one-third that number.

LEXINGTON ON 75% BASIS

The Lexington Motor Car Company, Connersville, Ind., has issued a statement in which it is announced that the factory is operating on a 75 per cent production basis.

STANDARD TRUCK SALES CHANGE

Sales and service of the Standard Motor Truck Company, Detroit, hereafter will be handled direct from the factory at 315 Bellevue avenue, it is announced by W. A. Marfey, sales promotion manager.

GOODYEAR REFINANCING STATUS

The following announcement was made by the Goodyear Tire & Rubber Company with reference to the postponement of its meeting scheduled for March 4, to March 15 at which the stockholders are to pass upon the company's $85,000,000 refinancing program:

"Officers of the Goodyear company have been advised by the merchandise creditors' committee that owners of more than 75 per cent of the merchandise indebtedness dealt with by the 'plan of readjustment' have assented to the plan. While the company is gratified at the progress made by the merchandise creditors' committee, in view of the large amounts involved, the plan cannot be carried out so long as creditors of any substantial amount of the company's debt have not assented.

"Accordingly, the company does not feel justified in completing the changes in its corporate structure contemplated by the plan until substantially all creditors have filed their assents with the committee, and the meeting of stockholders called for Friday, March 4, will be adjourned until March 15. It is hoped that the remaining creditors will have signed assents and the plan can be declared operative."

MAXWELL TREASURER RESIGNS

Walter M. Anthony, who has been treasurer and comptroller of the Maxwell Motor Company since 1913, has resigned.

THREE MICHIGAN SHOWS

Flint's 1921 automobile show was as successful as other events of the kind held in other cities of the state thus far this year. Record-breaking attendance and dealers selling cars, and especially lining up a good many live prospects are reported. Cars shown included Packard, Cadillac, Buick, Chevrolet, Essex, Hudson, Dort, Nash, LaFayette Dalon Track, Overland, Willys-Knight, Ford, Dodge, Studebaker Paige, Liberty and Fordson tractor. In addition there was a decidedly interesting and representative display of accessories and parts. One exhibit, that of the Champion, was in the nature of a history of the spark plug. Another display was that of the Imperial Wheel Company, also giving a good idea of the progress made in the construction of artillery wheels. The Flint Motor Axle Company, Marvel Carburetor Company and a score of other local concerns had their wares on display. The show was promoted by the Flint Automobile Dealers' Association.

Battle Creek will have a show at the former Red Circle, in West Jackson street, March 28 to April 2. There will also be a show, March 17 to 19, at Silver Beach pavilion, St. Joseph, promoted by the Twin City Auto Dealers' Association, which embraces the distributors of St. Joseph and Benton Harbor.

DU PONT IN FLINT AND PONTIAC

Flint was visited by Pierre S. du Pont, president of the General Motors Corporation, last week. So was Pontiac. In both cases practically nobody but a few of the higher officials of the local units of the Corporation had been advised of the "chief's" visit. In Flint Mr. du Pont had luncheon as guest of the Board of Commerce, to which body he was introduced by C. S. Mott. Mr. du Pont addressed the members, saying in part:

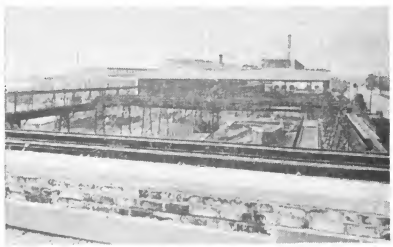
"I have been told that the best way to size up a city is from the appearance of its men and its hotels. I have been in Flint only 15 minutes but have had an opportunity to see both and am convinced that Flint ranks 100 per cent in both respects.

"General Motors has undergone no great change. The men who are General Motors, the executives who operate our factories, are still with us and we hope will continue with us. Men like Mr. Bassett—he is president of the Buick Motor Company—are the men who run General Motors, and with their help we are going ahead with the same efficiency.

"Flint may have no fear for the future. Flint has made General Motors as much as General Motors has made Flint. I hope that relation will continue. May I ask you at our first meeting that we continue to work together for the success of Flint and General Motors?"

In Pontiac after visiting the local GMC units Mr. du Pont said to a number of interviewers practically the same thing he had said in Flint.

FOUR DURANT PLANTS FOR STATE?



While in Cleveland recently Carroll Downes, vice-president of the new Durant Motors, Inc., said, it is reported, that W. C. Durant expects to have four plants in Michigan, namely, in Flint, Jackson, Saginaw and Lansing, and that his first car, which will sell for less than $1,000, will be out some time in April.

OLDFIELD TIRE ELECTION

J. M. Dine, who has been identified with the rubber industry 14 years, first with Goodyear and later with Firestone, has been appointed vice-president and general manager of the Oldfield Tire Company, Akron, of which Barney Oldfield is president. B. M. Robinson has been elected secretary; H. L. Allsop, treasurer, and M. E. Moffett, assistant treasurer.

BUILDINGS FOR SALE

The following described buildings, located at Wyandotte, Michigan, were constructed in 1918 for war production and are therefore no longer needed:

Main building of structural steel construction, 335'x380'. Three bays are equipped with 7½-ton Electric Traveling Cranes.
Two-story Steel, Concrete and Brick building, 160'x60'.
Steel and Brick Power house building, 43'x100'.
Steel Warehouse, 28'x100'.
Two--story Brick, fire-proof, office building, 40'x51'.

And in addition:

600-ft. Steel Crane Runway outside of buildings.
Nearly three-quarters of a mile of railroad track.

Will consider leasing the land, consisting of approximately 700 feet on Biddle Avenue, with an average depth of 688 feet to the Detroit River, with option to buy on easy terms.

This is an unusual opportunity to acquire splendid property for manufacturing or other purposes.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Detroit—Judges Arthur C. Denison, Cincinnati; Clarence W. Sessions, Grand Rapids, Rapids, and D. C. Westenhaver, Cleveland, sitting in the United States District Court at Detroit, late last week granted the injunction sought by the Michigan Central and 12 other Michigan roads restraining the state of Michigan from enforcing the provisions of the Smith fare law, under which 2½ cents a mile would be charged, as against the 3.6 cent rate authorized by the Interstate Commerce Commission. The court held that the authority of the I. C. C. in rate and fare matters superseded that of the individual states until such time as a change should be ordered by Congress.

Port Huron—The force at the Grand Trunk shops was increased by 375, March 1, and there are now 500 on the payroll. A general shutdown was ordered February 12, but some 120 men were kept to do certain important work.

Detroit—Henry Ford has been elected president of the Detroit, Toledo & Ironton Railroad to succeed James A. Gordon, who remains a member of the board of directors. Other important changes in personnel are announced. C. J. Kavanaugh, general superintendent, and C. P. Burgman, superintendent of motive power, retire. Kenneth Cowper, of Springfield, O., has been appointed superintendent of the northern division, and William H. Kinney, also of Springfield, superintendent of the southern division. E. B. Dudley, general auditor; C. H. Hochstetter, assistant general freight agent, and C. A. Young, treasurer, have been retained. Other changes are to be announced later, it is reported.

Washington—In the matter of the Kalamazoo Tank & Silo Company, Kalamazoo, Mich., against the Director General of Railroads, as agent, the Chicago & North-Western Railway Company, et al., the Interstate Commerce Commission has decided that the storage charges on hollow building tile held on carrier's right-of-way at Boone, Ia., were unreasonable and has awarded reparation and prescribed the measure of reasonable maximum charges. The case, which was No. 11000e on the Commission's docket, was submitted on April 23, and decided December 29, 1920. The findings have just been published.

Detroit—Representatives of the common labor employed by the Michigan Central Railroad conferred in Detroit this week with representatives of the company regarding contemplated revision of wages downward. It was announced by the labor men previous to the meeting that they would oppose any reduction. A statement issued by Henry Shearer, general superintendent, said that the road had made an investigation of the wages paid its common labor and had found that they were higher than in other industries. The law provides that before a case of this kind can be taken to the Railway Labor Board, the roads and their employes must make every effort to reach an agreement.

Detroit—The Interstate Traffic Association, an organization whose purpose is to trace and expedite the movement of cars and carlot shipments through the Detroit, Toledo and Windsor terminals for firms who employ car tracers, has elected J. E. Foland president and J. Edward Berry secretary-treasurer. The association's offices are at 503 Lincoln building.

Lansing—John T. Ross, traffic manager of the Lansing Chamber of Commerce, has advised Lansing concerns to ship to southern points by water, where possible, in order to avoid the higher rail rates approved by the Interstate Commerce Commission.

Detroit—O. C. Conlee has been appointed general agent in Detroit for the Detroit, Monroe & Toledo Shore Line Railroad, succeeding O. K. Ingham, who has been assigned to other duties. The appointment dates from March 1.

Battle Creek—More than 500 men are said to have been called back to work at the motive power shops of the Grand Trunk Railway. The working schedule is 48 hours a week. It is reported that there are now $3,000,000 worth of new freight cars in the yards; also 12 locomotives which have been completely overhauled.

Detroit—Another illustration of what the "scrambling" of railroad equipment implies has come to light in the office of the superintendent of car service of the Pere Marquette Railway. Nearly two years ago, more than 2,000 cars were purchased, and of these, 660 cars—33 per cent—have not yet reached the home lines. Other roads have been keeping them in service because of the fact that they involve practically no maintenance and repair service.

Washington—Authority to obligate itself to the extent of $2,500,000 for the purchase of equipment to cost $3,402,141 has been asked of the Interstate Commerce Commission by the Minneapolis, St. Paul & Sault Ste. Marie Railway Company.

A CORRECTION

The list of new officers of the Mayes Brothers Tool Manufacturing Company, Port Austin, as published in this paper February 26, contained inaccuracies. The annual election resulted in the selection of the following: President, Frank Kinch; vice-president, George S. Farrar; secretary-treasurer, H. F. Finan; general manager, John Mayes; directors, Lawrence Yaroch, Sr., S. J. Wallace, Frank Kinch, M. H. Mayes, John Mayes, H. Finan and G. Farrar.

CHAIN BELTS NEW PLANT

Work on four buildings of the new West Milwaukee plant designed by Frank D. Chase, Inc., engineers, Chicago, for the Chain Belt Company of Milwaukee, has been completed. One building is used for the manufacture of Rex mixers and pavers, provision being made to convert this into a malleable iron foundry at a later date. The core-making building is of concrete and steel construction, with the first floor used for pattern and baked core storage, the second for metal pattern shop, and the third for core making. The Pond truss type roof used dispenses of the hot gases and smoke and provides perfect lighting. The addition to the foundry building has an "A" frame roof construction, the new section being readily recognized by the improved lighting. To care for the increased power, the powerhouse was also extended. By having a well co-ordinated plan of development prepared in advance, all of these additions have been made as a part of a constructive program, which means operating efficiency at all stages of growth.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Chicago—The Seventh Federal Reserve Bank has issued a report on building and housing activities in its territory, which includes Illinois, Indiana, Iowa, Wisconsin and lower Michigan. Regarding building permits issued in January as compared with the corresponding month in 1920, the following statistics are given for 10 Michigan cities: Detroit, 813 permits, cost $3,944,943 as compared with 686 permits cost $5,658,830; Grand Rapids, 112 permits, cost $267,347, as compared with 72 permits, cost $528,455; Flint, 81 permits, cost $45,929, as compared with 156 permits, cost $852,965; Saginaw, 49 permits, cost $25,694, as compared with 44 permits, cost $52,415; Lansing, 43 permits, cost $83,749, as compared with 23 permits, cost $49,035; Bay City, 30 permits, cost $17,000, as compared with eight permits, cost $37,400; Battle Creek, 26 permits, cost $24,775, as compared with 17 permits, cost $18,248; Kalamazoo, 16 permits, cost $77,475, as compared with 12 permits, cost $26,181; Pontiac, 45 permits, cost $34,933. Total number of permits issued this year was thus 1,235 and cost involved $4,602,887, as compared with 1,030 permits issued last year (Pontiac figures were not available) the cost involved being $7,262,492.

Several examples were mentioned in the report to show that cost of construction is decreasing. One case cited was the result of an investigation of the Illinois Society of Architects. It referred to an 18-apartment building. Under date of May 24, 1920, the estimated cost of the structure was fixed at $225,548; under date of January 10, 1921, the cost was set down as $192,209. The largest reductions made were those in carpentry, plastering, painting and masonry. Another example was the case of a manufacturing plant, the cost of which was estimated at $605,348 under date of July 19, 1920, and which was revised to $551,282 on January 19, 1921. In this instance the percentages of the total show that $349,015, or 63.29 per cent was for materials and $202,265, or 36.61 per cent, was for labor.

Grand Rapids—Twenty-nine permits were issued during the week ended March 4 but the cost involved was only $24,200, as compared with $42,525 for 26 recorded the previous week. Most of the permits were for dwellings. For the week which ended February 26, 20 permits were taken out, the outlay aggregating $42,525. This compares with 24 permits for the previous week and in money is about $33,000 less. Of the 30 permits, five were for new construction. The largest item was the permit to the Brown-Graff Company for a warehouse to cost $20,000. The second largest was for a garage to cost $7,000.

Rockford—Eighteen bids were received on the construction of a school building for which $76,000 was voted by the citizens. Inasmuch as not one of the bids was for less than $100,000, all were rejected.

Lansing—Lansing contractors and builders look for a busy season and are preparing for it. E. H. Ward & Company report that they have many orders for furnaces. The Cooper-Ehinger Construction Company has started work on four homes. The Lansing Company says all indications point to considerable road building throughout the state. There is an especially strong demand for cement mixers and road scrapers and levelers manufactured by the company.

Detroit—The reports from the Detroit Builders & Traders' Exchange for the two weeks ended March 3 fail to show that any important new jobs have been awarded by contractors. There have been awards on sub-contracts, on alterations and other minor jobs, but very little that has a direct relation to manufacturing. As far as projects for the future are concerned, the list from the architects shows that much is in preparation. Among the projects reported are the following: A two-story bank and office building, a store and office building, a store and assembly hall, a contemplated state penitentiary, a 50-apartment building, a nine-story building, a theater building, a contemplated double-deck stadium for the Detroit Baseball Club, a 60-apartment building, a one-story 10-store and garage building, a four-story store and flat building, and a number of other jobs.

The week ended March 5 was one of the best thus far this year in the number of permits issued. There were 332 permits, as compared with 127 for the previous week, 234 for the week of February 19, and 231 for the corresponding week a year ago. The expenditure involved last week was $986,670, as against $557,625 for the week of February 26; $694,990 for the week of February 19, and $703,060 for the corresponding week in 1920.

Three Rivers—The Eddy Paper Company, it was announced late last week, will build a mill for manufacture of paper fruit boxes to replace the present board boxes.

How Motor Bodies Are Made

(*Continued from Page 7*)

auto body factory, like that in plants where articles of similar class are made, is done under a system capable of indefinite expansion or contraction to meet passing conditions.

Once the body has been assembled, the next operation considers "Saving the Surface." The finished body is covered with preparations which prepare it for the finishing paint shop.

The first coats to be applied serve to preserve the metal parts against rust and the wood against warping and weather changes. This is entirely protective. The later coats are built up to prepare for the high finish that gives the body its beauty.

Practically all the painting is now done by spraying. The drying is done in ovens. Many of the plants have worked out their own ovens designs and called in builders to complete them. They are designed to give a circulation of air at a temperature approximating 125 degrees. Steam heat is widely used. Spraying has proved valuable because of its speed. It is possible to manufacture bodies by progressive production processes, moving them along on conveyors and painting and drying them on schedule time by means of these improvements over the old-fashioned system of paint pot and brush. Only seven panels still demand hand work before the last coat is to be applied. Here and in the trimming the spray loses out.

Perhaps the greatest economy, according to manufacturers, which the modern system of painting and drying has effected has come in the saving of floor space. The oven can dry any coat of paint in less than one day, and under conditions absolutely controllable, where under other methods the body would have to

Detroit Week Celebrated By the Board of Commerce

This has been "Detroit Week" with the Board of Commerce, a series of noon meetings having been held at which the city's present problems and future growth, particularly as related to the assistance given by the Board, were discussed.

The introductory address, at the meeting on Monday, was delivered by Charles H. Campbell, president of the board. In the absence of the Mayor, the spokesman for the city was Acting Mayor John C. Lodge, who spoke on "Detroit's Next Million." The guest of the day was Julius Kahn, chairman of the House committee on military affairs, who chose for his subject "American Problems of the Present Day." March 8, the second day, the topic was "Detroit's Freight and Passenger Transportation Requirements," the principal speakers being A. T. Waterfall, vice-president and assistant general manager of Dodge Brothers, and Col. Sidney Waldon, chairman of the board's committee on aeronautics.

"Is Your Next Door Neighbor a Good American?" was the subject on Wednesday, the speakers being Frank Cody, superintendent of Detroit public schools, and Fred M. Butzel, vice-chairman of the Board of Commerce Americanization committee. Thursday, March 10, David A. Brown, president of the General Necessities Corporation, spoke on the subject "Keeping the World Sold on Detroit," and Dr. James Inches, police commissioner, talked about "The Practical Side of Safeguarding Detroit."

John A. Brown, president of the Detroit Retail Merchants Bureau, was the speaker Friday, his subject being "Selling a Million People What They Want;" Julian A. Krolik, of the wholesale house of A. Krolik & Company, spoke on "Enlarging Detroit's Wholesale Market."

Harry A. Wheeler, president of the Union Trust Company, Chicago, and former president of the Chamber of Commerce of the United States, is guest of honor at the "Get-together Dinner" tonight, at which the other speaker will be John A. Russell, vice-president of the Board of Commerce, and editor of this paper. Mr. Russell's topic is, "Detroit's Commercial Possibilities and the Board of Commerce."

ROBINSON'S MONTREAL OFFICE

Dwight P. Robinson & Company, Inc., engineers and constructors, New York, have opened branch offices in Montreal, in the Dominion Express building. Alexander C. Barker, vice-president, is in charge. The company is a consolidation of Westinghouse, Church, Kerr & Co., Inc., and Dwight P. Robinson & Company, Inc., and has done extensive construction and engineering work in Canada for the Canadian Pacific Railway, Canadian Salt Company, Canadian Crocker-Wheeler Company, Dominion government, Aetna Explosives Company, Grand Trunk Railway and others.

FARMINGTON BANK PLANS HOME

Directors of the Farmington State Savings Bank, Farmington, Michigan, have organized the Farmington Improvement Company with a capital of $100,000 and have arranged to buy the Owen Hotel property on Grand River avenue. A fine modern bank building of brick and cut stone construction will be erected. The building will also provide six stores, five shops of offices and five living apartments. Directors are: Fred M. Warner, Clinton McGee, Harley D. Warner, C. G. Collins, Howard M. Warner and Edgar S. Pierce. February 21 the Farmington State Savings Bank reported total assets of $822,171.09 and total deposits of $604,447.84.

Frank Sage, who is interested in the Hastings Lumber & Coal Company, Hastings, and who formerly was with the United States Rubber Company, has become manager of the Hastings Wool Boot Company.

A Malleable Iron Pressure Ring (12½" diam.) for a Tractor finished on a W. & S. No. 2-A. The tools on the two turrets are the entire equipment necessary for completing both chuckings.

Be Ready for Increasing Business

Remember there are no obligations attached to the engineering services we offer you. If we cannot help you we tell you so. But—we have helped others to increase the earning capacity of their turret lathe equipments and are ready to try to help you if you wish.

We've had forty years experience making and tooling turret lathes to satisfy unusual demands. Draw on our experience and be ready for the business increases which are bound to come soon.

Write us and we'll send an engineer to consult with you, or send us blueprints and samples of your work for estimate.

DETROIT, SATURDAY, MARCH 12, 1921

The Proposed State Income Tax

THE very pronounced declaration made against the proposal for a state income tax to a committee of the legislature this week indicates how strongly the business folk of the state feel on the subject. Burdened since federal war necessities called for the product of an income tax, our manufacturing and commercial population has no heart for the addition of a second tax of this character for state purposes. This proposal is the distinct and concrete attack of the agricultural districts of the state upon the prosperity of the industrial cities and villages. It originates with the Grange and the Michigan State Farm Bureau, two organizations which are distinctly agricultural and equally distinctly organized against justice to the cities and villages. Having come to the point where there must either be economy—and the farmer legislator is the last man to insist upon economy—or more revenue for the state, the agricultural interests have quite class-consciously united in an attempt to put it over on the industrial counties. It does not seem to enter the minds of the tillers of the soil that the very best fiscal course that they can adopt for the state is one which is not harmful to their principal markets, the cities of the state. It does not seem to satisfy them that under the present defective method of equalizing the burdens of state taxation the rural counties are paying taxes on from one-third to one-half the value of their properties, reckoned on a cash basis. It does not seem to be admitted that the leading industrial and mineralized counties of the state are paying a share of the state tax that is all out of proportion to their population, their wealth or the values of the properties contained within their boundaries. All that enters the strabismic eye of the agricultural tax economist is that the cities still have something left, and that from them that have shall be taken away, to reverse the scriptural description.

An income tax in Michigan is an undesirable tax, because taxes on incomes having been appropriated by the federal government as a source of revenue, should be permitted to remain to it as its separate source of such revenue. This is good tax economics.

An income tax in Michigan is likely to be an unjust tax, because the more closely the inquest for such revenue approaches the farmer the more likely it is to become inexact and incapable of proper incidence. The business enterprise keeps books on its operations largely for cost-keeping purposes; largely, too, because these enterprises are the property of many persons, associated as partnerships or corporations. The farm operation is at most a family operation on which books are rarely kept, and the income of which may be made the subject matter of the widest and wildest guessing. Any one familiar with the character of the returns made on the federal income tax will have little trouble recognizing how vastly disproportionate the returns would be, dollar for dollar of actual income earned, between the industrial and the agricultural unit of income. Where the incomes of individuals are concerned the city employe on a salary would not be one-two-three with the farmer as to living expenses. The city man's living expenses are actual, calculable and registerable. The farmer's living expenses may be set at almost any value he puts upon them, because they are vague, indefinite and unregisterable.

The state of Michigan does not need an income tax. What it does need, in the order in which we are about to set them down, in order to bring about a better relation between state income and necessary expenditure, is something like the following:

First—A system of rigid economy which will cut out fads and faddists, make state institutions something less than fashionable boarding houses, and without reaching either toward niggardliness or meanness, make the fare and accommodations of prisons less inviting and the housing and keep of defectives and dependents a little lower in the scale than that of competent and honest people who earn their living and maintain their homes.

Second—The incorporation in the tax levy of about a billion dollars in the value of farm lands which are today under-assessed, and which, priced at public sale at from $150 to $200 per acre, are assessed for tax purposes at from $35 to $60 per acre.

Third—The wiping out of the exemption from taxation of nearly $300,000,000 of municipal securities held in this state, which are not only not contributors to the tax levy, but are hindrances to the investment of capital in industry, commerce and both urban and agricultural real estate.

Fourth—If the adjoining states of Wisconsin and Minnesota put, as they are threatening, a tonnage tax upon the products of their mines, then a tonnage tax should be placed upon the product of Michigan's mines. In the event that Minnesota taxes iron ore, the Minnesota tax will determine the market and the Michigan mine owner will be collecting the tax for himself, whether he has to pay it to the state or not.

Michigan needs no income tax. She needs no corporation tax, either. If she starts out with a repeal of unnecessary and damaging exemptions and makes the agricultural land-owner pay taxes on even percentages of true values with the city land-owner, we shall have plenty of leeway for additional state revenue for many years to come.

Democracy, Oligarchy and Tyranny

PEOPLE have but to read history to note that communities and nations which reduce the units of representation in their legislative bodies eventually lose control of their representation and drift into the control of their office-holders. That tendency has been rampant in Michigan in late years, and it is about time that the public took notice of it. First off, some theorists proclaimed the inefficiency of the aldermanic representatives of cities in their local councils. In Detroit, Grand Rapids, Kalamazoo and other cities of size in this state the men who came from

Digitized by Google

the common people and the lowly districts were declared to be incapable of representation, and moves for commission forms of government and small councils were backed up by respectable but professional reformers. Every one of these movements was preached by men who were making a living out of their preachments. Every Michigan city which has reduced the number of its local legislators is governed worse today than it was under the old system. There is less responsibility. There is greater concentration and abuse of power. There is heavier expense of government.

As the situation progresses the tendency is to reduce the powers of the electorate. Only today the city clerk and acting mayor of Detroit are denouncing the expense of holding primary elections at which the people may determine who are to be their officials. This is a step in the direction of oligarchy, the government of the people by the chosen few. The next logical step, if it were possible in America, would be a dictatorship.

In the state a similar movement is in its inception looking to the abolition of the democratic and republican system of supervisor governments, thoroughly representative, and the concentration of power in the hands of a limited number of legislative and executive officials. This, too, must lead, as it has led in the cities, to lessened responsibility and eventually dearer government. Professional theorists, who get sap-headed, pseudo-reformers to support them, the aforesaid sap-heads having no actual knowledge of the theories of government or the basis of the American system, are preaching the desirability of turning from democracy to oligarchy. If the state listens to them and accepts the change, the day of petty tyranny is not far off.

Six Men on a One-Man Job

UNDER the present classification rules of the railroad shop crafts—rules which the roads are seeking in proceedings before the Railroad Labor Board to have terminated—such labor waste as is illustrated in the following case is of constant occurrence:

In order to change the nozzle tip in the front end of a locomotive it is necessary—

1. To call a boilermaker and his helper to open the door, because that is classified as boilermakers' work;

2. To call a pipeman and his helper to remove the blower pipe, because that is classified as pipemen's work; and

3. To call a machinist and his helper to remove the tip, because that is classified as machinists' work.

The same three forces must be employed in reverse order to put in the new tip.

Before federal control a machinist's helper or any handy man around the place put in nozzle tips alone.

Similarly, railroads are required to employ members of three crafts—machinists, sheet metal workers, electricians and their helpers—to make a repair on a locomotive headlight, which job formerly was handled, and can be handled today, by one or two men.

And then the alleged economists wonder why, in the face of larger gross revenues, the railroads continue to pile up deficits!

Merchandising is like operating a wheelbarrow. A man must get behind and push. Advertising is the lubricant that makes the pushing easier, no matter how heavy the load is.

The Bureau of Mines, at Washington, has discovered a method of making chloroform from waste gas. The Bureau could put the invention to good use by running some of the speeches at Lansing through a condenser. And then, to make the process of the utmost benefit, it might turn the product back on some of the speech makers.

Success is not so much in rising early as in keeping awake after getting up.

Experience is a dead loss if it can't be sold for more than it cost.

Customers never wait for anybody to get over a blue funk.

Your income tax is due next Tuesday.

There it is, our daily menu.
You have but to pick and choose.
Where it comes from doesn't matter,
If it happened it is news.

* * *

We thought the fad of "I AM" advertisements had pretty well passed away and that we would not be pestered with them any more. But it still seems that every once in a while another comes to life and gushes and spouts "maudlinisms" all over the place. This reached us a few days ago from a great printing trade paper. We quote in part, which ought to be enough for anybody:

"I AM THE PRINTER.

"I am he whose facile hands transform the thoughts of men into solid substance. I stand keen-eyed and eager-hearted, beside my mighty, rumbling presses that I may blazon to all the world the loves and hates . . . of humankind. The fruits of my toil give comfort to the aged and honest pleasure to little children . . . Through my faithful hands must pass to be inscribed upon time's deathless scroll the valiant deeds of the warrior—the ringing phrases of the statesman—the matchless cadence of the poet's song, etc."

We took the above to the best printer we ever met, and he's some printer. Admits it. We quote as literally as the postal authorities will permit.

"Most of the thoughts are solid substance before we ever see them," he began. "Whereinell does he get that 'keen-eyed' and 'eager' stuff? That guy can work for me at double the anion scale if he'll make good on that for one hour a day, thasaal, one hour a day, get me." Comfort to the aged and pleasure to the kids, eh! Well, take it from me, what he means is the ocean of piffle that gets into little story books that keep the cost of white paper up. This is rich. Deathless records of statesmen's ringing phrases. I know what he means. The Congressional Record and the journals of the state legislature. Ho, hum. Get out of here. This blankety press ain't feeding worth a whoop. Come around after hours. I'm busy now."

FINANCIAL

By PHIL S. HANNA

IT BECOMES the task of Andrew W. Mellon, Pittsburgh banker and Secretary of the Treasury, to solve a financial conundrum which, from the standpoint of importance to the business of the country, has not been equaled since the days following the Civil War. Secretary Chase, under Lincoln, evolved the greenback plan which served the problem of financing the Civil War debts and the needs of the Government and business at that time.

Today Mellon must evolve some scheme of financing the Government without continuing the unhealthy arrangement by which the Government bids against business for the credit supply of the country. U. S. Certificates of indebtedness bear from 5 to 6 per cent interest and are so very attractive to large investors that the last issue was nearly twice over-subscribed. But we may have confidence in Mr. Mellon, for he has been a careful and successful financier all his business life and is likely to conjure up a prescription for the country's financial ills which will effect the cure and at the same time make us enjoy the medicine.

* * *

Is remission of the foreign war debts a good thing? The answer reminds one of the story about the bartender who asked his employer if Pat was good for a drink, the ensuing conversation being:

"Has he had it?"

"He has."

"He is."

In a measure this applies to most of the conuries to which we have made advances. It wouldn't have been human to ask if they were good for the loans they received. They have received the money, spent most of it here and the only way under heaven they can pay it back, if ever they are able, is to send us goods. And if the only remaining unencumbered reserver of wealth in the world does not go to their aid to improve conditions so goods can be manufactured, they can't send goods enough even to meet the interest. Some day Bahson will tell us exactly how many billions went up in smoke during the war and it may sink into our consciousness that most of our financial contribution to that holocaust stayed right with us in the form of handsome dividends, silk shirts and joy rides, while the poor devils over there—plus our own soldiere—stood the gaff.

From a human standpoint and indefinite extension is little enough for us to give under the circumstances, but leaving the human consideration out of the reckoning, if my best customers owe me more than they can pay, time has to be given. In forcing collection I lose both the money lent and the custom. And so long as the elusive good times which we all crave depend to such a large extent on maintaining foreign outlets for our goods and crops, we had better look first into the health of our customers rather than worry ourselves about debts which are not now collectible.

The last ten days have produced not a little "hurry up" order business for the steel companies. A representative of the U. S. Steel Corporation reports that his company has received an agreeable quantity of such requests from Michigan. In the main the orders are to balance up stocks and inventories, but the reappearance of rush business shows which way the wind is blowing.

* * *

But hold on to your hat! Prices of many things may go lower still, as business continues to recover. And margins of profit will narrow simultaneously with increasing volume. Rather than a cause for pessimism it may be interpreted as a good reason for optimism, for it means merely that the flesh is reducing more nearly to the dimensions which the skeleton of business was designed to carry. Thirteen of the larger Detroit banks owned on February 21 collectiveiy $58,600,000 of U. S. Certificates and Liberty bonds, nearly enough to pay off the aggregate borrowings of the same institutiions at the Federal Reserve Bank. Perhaps Mr. Mellon will devise a way to transfer this remnant of the war load to the investor, where it belonas. And so much of it as is taken by investors who are not depositors in the banks will be available for business.

THE PLEASURE IS ALL OURS

On Tuesday morning of this week the Detroit Stock Exchange official quotation sheet came out all dressed np in the form originated by the Michigan Manufacturer and Financial Record. The sheet now gives full information daily as to range of prices, dividends and capitalization of the companies whose stocks are listed on the Exchange. This change will be welcomed by the members of the Exchange and is indicative of the superior service which Secretary Nathan and his corps are rendering the brokers and stockholding public.

MICHIGAN MUTUAL LIABILITY

The annual financial statement of the Michigan Mutual Liability Company, Detroit, as of December 31, 1920, is being distrihuted and exhihits some interesting and favorable comparisons with the halance sheet of December 31, 1919. The guaranty reserve fund and surplus, which is now $1,154,667, was $697,296 a year ago, or an increase of $457,371. Total resources are now $6,888,889, as compared with $4,792,827 a year ago, a gain of $724,062. Of total assets nearly one-half, or $1,114,530.25, is represented by highly liquid securities and cash in hank, the former aggregating $551,641.87 and the latter $562,888.38.

HUGHES FORMS BANKING FIRM

S. Harvey Hughes, together with Frank A. Gordon and William L. Brasie, has formed a corporation under the name of Hughes, Gordon, Brasie & Company, to transact a general investment business in high-grade bonds in Detroit. Mr. Hughes has been in the bond business for eighteen years, beginning in New York under Frank A. Vanderip and having had charge of the Detroit office of the National City Company for the last six years, until Decemher 15, when he resigned to form this company. Frank A. Gordon started in the bond business in Michigan in 1909, having prior thereto been connected with W. G. Souders & Company and Devitt, Tremble & Company. He has had sixteen years experience in investment dealing, more recently having been in business under the name of Frank A. Gordon & Company. William L. Brasie recently severed his connection with the First National Company, Detroit, to associate himself in this undertaking. He has had six years' experience, having been connected with the National City Company and S. W. Straus & Company as a salesman.

These gentlemen are all well known to the investing public of Detroit. Mr. Hughes is president of the new company; Mr. Gordon, vice-president and treasurer, and Mr. Brasie, vice-president and secretary. Offices are located at 1438 Dime Bank building.

Klingensmith Heads New Motor Car Corporation

Several well-known Detroiters formerly connected with some of the largest automobile manufacturing concerns in the country are interested in the Gray Motor Corporation, which has just been formed and which will bring out a new car, a four-cylinder, to sell at $1,500 or thereabouts everywhere in the United States. The president of the company is Frank L. Klingensmith, who formerly was vice-president and treasurer of the Ford Motor Company. Frank F. Beall, formerly vice-president of the Packard Motor Car Company, is vice-president; George H. Kirchner, president of the First State Bank, of Detroit, is treasurer, and J. B. Moran, secretary and assistant treasurer. William A. Blackburn, formerly factory manager of the Cadillac Motor Car Company, who is also interested financially in the new concern, is factory manager. The corporation has an authorized capitalization of $4,000,000, and is in reality the successor of the Gray Motor Company, which has been in existence for some time. It was to this latter concern that Mr. Beall came after he left the Packard company, and it was here that he developed the new engine which now will become the power plant of the new car.

SOMETHING NEW IN EXCHANGE

An incident was related in these columns last week of a judgment given against the Highland Park State Bank in favor of Peter Moroz, who gave the bank $500 in 1917 to send to his wife in Rnssia, but owing to non-delivery of the money to the beneficlary, sought to force the bank to reconvert ruhles into dollars at the same rate of exchange that existed in 1917 when he bought the ruhles.

Advices now have been received from New York that arrangements are under way whereby a New York bank will act as agent for the Polish government in forwarding dollar remittances to Poland. This will enable one who desires to send money to Poland to buy drafts drawn in dollars, which the Polish banks will be required to convert into marks at a rate established daily by the Polish government. The money received by the New York bank will be held in a special fund until definite advice of payment to the beneficiary has been received, at which time it will be turned over to the Polish government. The advices also state that the Polish Minister of Finance has agreed to ntilize a fair proportion of the funds growing out of these transactions in the purchase of American goods or for liquidation of Polish accounts in America.

Under this arrangement, Moroz could have redeemed his $500 with but little loss, hut of course the rate for drafts payable in marks in Poland is likely to be much more attractive from the standpoint of the beneficiary than a draft payable in dollars until the market for Polish marks returns somewhat nearer par and lends to equalize the difference between the discount and marks and premium on dollars. The Guaranty Trust Company and the National Bank of Commerce in New York are working out plans to handle this business. Next week we expect to publish an article on this subject by Fred W. Allen, manager of foreign exchange, American State Bank, Detroit.

New Export Problems

Mere order-taking in foreign trade has had its day. Though American shipments of foods, merchandise and materials over-seas continue large, exporters in every line recognize that the turn in the tide has come.

In future, goods that go abroad must first be sold. Customers must be sought, studied, served. Markets must be developed and connections formed on a basis of information and analysis even more exact than those required in securing business in the past.

In making contacts with unfamiliar markets—in keeping touch with changing conditions—in carrying out the financial or shipping operations required in over-seas transactions—the Irving's Foreign Service and Foreign Trade Divisions may be able to supply you with just the information, counsel or banking and commercial aid you need. For exporters—as well as importers—Irving spans all seas.

Who's Who in Michigan Finance

A. J. Maynard, Vice-President, Grand Rapids National City Bank and City Trust and Savings Bank

A. J. Maynard, vice-president and cashier of the Traverse City State Bank, has been elected vice-president and director of the Grand Rapids National City Bank and the City Trust and Savings Bank of Grand Rapids.

A. J. MAYNARD

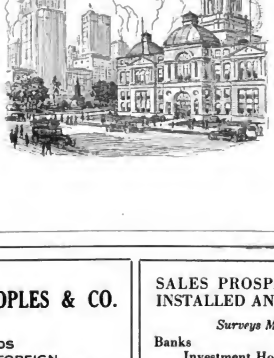
The story of the rise of August J Maynard is an inspiration. It affirms anew the doctrine so often demonstrated, but often lost sight of by the impatient bank employe, that there is everlastingly room at the top for the man who will work hard and live right. Mr. Maynard's prescription for getting ahead, as related by a friend who has known him many years, is worth knowing. It gives one an insight into the character of the man as well as accounting in large measure for the enviable position he holds in the affections and respect of him many acquaintances.

He believes in making one's job a hobby instead of permitting the hobby to overtop the job; yet he has found time to keep healthy and sociable. But he believes in liking the job so well that making good at the job makes friends at the same time. Another characteristic of August J. Maynard is his unshakable loyalty to those friends.

There was once a young man who got into trouble of a serious nature and needed a friend at court. Unsolicited, although the man had gone out of his life entirely, Mr. Maynard took the train and spent hours and money to get his friend another chance, which was obtained. And then he spent more of his time laboring with his friend to overcome the latter's temporary obsession. The friend afterward became respected and honored, but few ever knew of the unselfish pains which Maynard went to, to save him.

Mr. Maynard was born in Detroit and went to northern Michigan in 1893. He worked in a lumber and shingle mill at Interlochen. He also worked in a shoe store and a clothing store, and on December 1, 1901, he started as messenger in the Traverse City State Bank and soon advanced to teller. Two or three years afterward he came back to Detroit to accept a position with the old Peoples Savings Bank, but in 1906, upon the death of Julius Hannah, he was recalled to Traverse City to become assistant cashier. When Samuel Garland died in 1911 he was made cashier and about two years ago was given the additional title of vice-president.

His friends testify that he is not easily hurried into a decision but that he thinks for himself, and when once decided is not readily moved. He is the quiet type of banker who inspires confidence, and is one of the most genuine personalities in the business. He will add much to the already high prestige of the two banks with which he becomes actively connected April 1.



WOULD SHORTEN FORECLOSURE LIMIT

The Detroit Real Estate Board has adopted a set of resolutions favoring a shorter time limit for mortgage forclosures, empowering of counties to establish tract index systems, and enabling act permitting cities to adopt zoning laws, passage of joint resolution providing for excess condemnation, and expressing its approval of the bill now in the Legislature to put outside securities under the general ad valorem property tax. Under the present laws it requires 15 months to foreclose a mortgage and obtain the money or the property. It is expected that the board will draft a bill with the aim of making mortgage money easier and possibly open the way for an amendment to the state banking law to permit a great per centage of funds for use on mortgage loans.

UNITED ALLOY STEEL

The United Alloy Steel Company has passed the quarterly dividend of $1 due at this time. This is the first time the dividend is being passed since December, 1916, when the stock was placed on a $4 annual basis.

Six years' experience in automobile and metal working industry, seeks new affiliation with a manufacturer who has an opportunity for a young man of intelligence and initiative. No objection to any community where conditions are right. Best of references. Member National Association of Purchasing Agents. Salary not important if prospects are good. Permanent connection desired. Address J. C. J., Michigan Manufacturer and Financial Record.

Banks and Bankers

TO ERECT $300,000 BUILDING

The United Savings Bank, Detroit, will begin construction about April 1 of a six-story, $300,000 office building on the site of the present Dean building, 1137 Griswold street. The lower floor of the structure will be used by the bank and the upper floors will be leased as offices. Wrecking of the Dean building will begin at once. The United Savings bank has been located at 1248 Griswold street since its organization, 19 years ago. Frank B. Leland is president.

NATIONAL LUMBERMEN'S BUILDING

Plans for the building to be erected in Muskegon for the National Lumbermen's Bank have been completed. It will be a four-story structure and will be located in Western avenue, east of Jefferson street. It is expected that it will be one of the most up-to-date banking offices in that part of the state.

CAPITAL NATIONAL'S INCREASE

The latest statement of the Capital National Bank, Lansing, shows that deposits have increased more than $62,000.

HAVILAND SUCCEEDS MAYNARD

Directors of the Traverse City State Bank, Traverse City, have elected A. J. Haviland cashier to succeed A. J. Maynard, who goes to Grand Rapids April 1. Mr. Haviland was added to the board of directors. He has been with the bank since 1897, having begun as a clerk and worked up through every position in the bank. For several years past has held the position of assistant cashier.

RAMBOUILLET COUNTRY CLUB

A group of younger bankers and brokers, including Wm. A. Neer, Messrs. Gardner and Dresser, John R. Bodell and R. T. Chenoweth are taking applications for membership in the Rambouillet Country Club. A tract of desirable golf land comprising 150 acres eight miles west of Pontiac on the Orchard Lake road, has been optioned. The first 200 memberships will cost $200 each and the second 200, $300 each. The distinguishing feature of this organization is the plan to avoid needless expense on the club house. The savings thus effected are expected to keep the dues down to a moderate level. Golf will be the main attraction, the improvements being limited to providing locker, shower and modest club facilities.

MICHIGAN'S GROWING TAXES

A report of the state tax commission shows that the total assessed valuation of real property in Michigan has increased 176 per cent from 1910 to 1920, the total state tax has gained 267 per cent and the rate per $1,000 has advanced 33 per cent. The total assessed valuation of both classes of property was $1,739,652,458 in 1910, while in 1920 it had increased to $4,800,000,000. The state tax in 1910 was $4,730,417.42, while in 1920 it was $17,378,328.35. The rate per $1,000 of valuation in 1910 was $2.72 and $3.62 in 1920. The rate for 1919 was $3.87 and the state tax amounted to $17,432,512.40. The total taxes levied from all sources in 1910 amounted to $35,710,509.65 and in 1919 the tax was $110,776,106.10.

CITIES SERVICE BANKERS SHARES

Cities Service Company's twenty-fifth monthly distribution on its bankers shares, payable April 1 to holders of record March 15, will be 35c a share. The distribution March 1 was made to more than 18,000 holders of record, there now being more than 53,000 holders of Cities Service Company common stock, preferred stock and bankers shares, comparing with 17,763 January 1, 1919, and 31,767 on January 1, 1920.

MOTOR WHEEL CORPORATION

At the annual meeting of the stockholders of the Motor Wheel Corporation, Lansing, last week, a 2 per cent cash dividend was declared, payable March 21 to stock of record March 10. The annual report as of December 31, covering a 10 months' period, showed that quick assets overbalance current liabilities in a ratio of 18 to 1. Harry F. Harper, president and general manager, announced that production must be increased. The new 3-hour day schedule was resumed the first of this week.

The directors re-elect are: H. F. Harper, William H. Newbrough, W. C. Brock, J. B. Siegfried, O. A. Jenkson, Edgar W. Nichols, Drury L. Porter and Clarence C. Carlton.

The current liabilities of the company were shown as $266,068.98, with current assets of $4,479,381.74. In accordance with the by-laws, 3 per cent of the cumulative preferred stock was retired. The letter of President Harper showed net operating profits for 10 months of $433,856.20. Cash dividends paid during this period amounted to $374,722.24, leaving $61,952.01 added to the surplus account, making a total of $2,339,389.80. A good volume of business is seen for the coming year.

The following statement compares the condition of March 1, 1920, with December 31, 1920:

ASSETS	Dec. 31, 1920	Mar. 31, 1920

Public Utility Notes

Lansing—The Michigan Public Utilities Commission has drafted a bill for submission to the Legislature asking that its authority be extended to include jurisdiction over the establishment of crossings of municipal with privately owned steam or electric lines. At present the only check the Commission now has on these crossings is on privately owned lines and can only be brought to bear by refusing to permit railroads to enter agreements with the city for crossings, when in the opinion of the Commission the proper precautions for safeguarding the public are not contemplated by the agreement.

Detroit—The street railway commission will open bids March 15 on 40,000 steel ties for municipal railway construction. On March 18, at 10:30 in the morning, the commission will open bids on 11,200 tons of steel rails.

Lansing—The Muskegon Light & Traction Company has filed application with the Michigan Public Utilities Commission for permission to cut its street car service in half. At present the company is maintaining a five-minute service but asks a ten-minute schedule. Competition of jitney bus lines is given as the reason. The company asserts that it lost $140,000 last year. The matter was brought to a head by the application of employes for an increase in wages.

Ypsilanti—The city has asked the Michigan Public Utilities Commission to send engineers and assistants here to make a survey of the municipal gas plant for the purpose of drafting recommendations looking to an improvement in the efficiency of the plant. The Commission has accepted the invitation.

Muskegon Heights—The Muskegon Heights Gas Company is building a two-story addition, 60 by 40 feet. The boilers are now being set in place and the steel erected. It is expected that the work will be completed within 60 days.

Lansing—Only a few of the 109 telephone companies in the state so far have complied with the order of the Michigan Public Utilities Commission to file with the Commission a complete report of all materials purchased, where obtained and under what conditions. Most of the companies reported that such data could not be compiled in 30 days. The object of the Commission is to ascertain whether a "telephone trust" exists in the state.

Michigan Bond Items

The city of Grand Rapids will submit to the voters at the election April 4 a proposal to bond the city for $100,000 for water main extensions. The bonds are to bear 5 per cent interest and are to mature in 20 years.

The citizens of Marysville have just voted favorably on a proposal to bond the school district for $70,000 for the erection of a school building and the remodeling of another.

Grand Rapids will receive bids for the purpose of disposing of the balance of $384,000 of 6 per cent tuberculosis hospital bonds. A total issue of $400,000 has been authorized but thus far only $16,000 worth have been sold. "If the bonds are not sold following the advertising for bonds," says the Grand Rapids News, "the public will be asked to support the project and buy the bonds as a patriotic duty to the city. The first $200,000 of the issue expires September 25."

It has been announced by the city clerk of Cheboygan that the total bonded indebtedness of the city is $179,000, maturing over a period of 23 years as follows: 1921, $6,000; 1922, $8,000; 1923, $11,000; 1924, $40,000; 1925, 1926, 1927, $5,000 each; 1928, $13,000; 1929, $13,000; 1930 and 1931, $5,000 each; 1933, $7,000; 1934, $5,000; 1939, $16,000; 1944, $35,000.

By a majority of 9 votes the taxpayers of Birmingham decided for the issuance of $135,000 of school bonds. The issue was immediately sold to Watling, Lerchen & Company, Detroit, at a premium of $45, the bonds to bear 5½ per cent interest.

Opening of bids on two bond issues of the city of Pontiac resulted in Hornblower & Weeks getting the issue of $126,000 of water improvement and extension bonds, for which the bankers had bid par, accrued interest and $419.40 premium, the bonds drawing 5½ per cent interest. The National Bank of Pontiac was awarded the issue of $60,000 of park bonds, these drawing 4½ per cent interest and the city agreeing to pay the bank a commission of $4,152. Another bid for these bonds was on the basis of bonds paying 6 per cent interest and the bank's paying a premium of $1,187. Other bids received were the following: Watling, Lerchen & Company, premium of $2,521, on the $126,000 series at 6 per cent and $2,400 on the same issue at 5½ per cent; for the $60,000 issue a premium of $1,092 for 6 per cent and $11 for 5½ per cent bonds; R. M. Grant & Company, for $186,000 of bonds comprising both issues, par, accrued interest and a premium of $3,403 on 6 per cent bonds; National City Company, premium of $2,700 for the $126,000 issue of 6 per cent bonds; National City Company, premium of $3,532 on the $186,000 of bonds at 6 per cent interest; Keane, Higbie & Company, $3,348 as premium for both issues at 6 per cent; Hornblower & Weeks, $55,822 for premium of $1,162 if at 6 per cent, the $60,000 park bonds of 4½ per cent, or a

Bond issues totaling $800,000 for the construction of pavement, sewers and bridges will be submitted to the Lansing voters at the April election.

The regular quarterly dividend of the Continental Motors Corporation, Detroit, has been passed in order to conserve cash resources. The business of the company is increasing daily, according to officials. It has been decided as a consequence of this improvement to call back more men. While 50 per cent of normal operations at either the Detroit or the Muskegon plant has not as yet been reached, it is expected that such will be the case before long.

THE OLDEST HOUSE IN MICHIGAN

Opportunity

You are able today to invest your money at Nine Per Cent in Government Bonds over a long period of years. This means that when money again becomes cheap, with interest rates at perhaps three or four per cent on Government Securities, you will be receiving double or triple the income with equal security. Is it not worth while investigating such an opportunity? We shall be glad to send you a selected list of high-grade bonds.

Why do Corporations appoint Transfer Agents and Registrars?

For their own protection and for the protection of their stockholders, as an additional precaution against careless or fraudulent over-issue or duplication, or any act of omission or commission affecting the validity of the transfer of a certificate of stock; in short, for protection against fraud, for conserving the corporate property, to see that legal requirements are complied with and to facilitate transfers both at the home office and at distant markets. We will take pleasure in explaining in detail the efficient manner in which the SECURITY TRUST COMPANY furnishes this service.

Don't Use a Telescope

Reduce your prospective investment to the minimum—don't magnify it. Look at it in the worst light. Will it hold up? Will it be as valuable in ten years as to-day? Is it secured threefold? Is the collateral behind it sufficient? Will its earning power be constant? Can you sell it if you need to? Can you borrow against it? Is it secure from the see-sawing stock market? Is its dividend rate adequate? If it passes this test—buy it—for it will be one of our First Mortgage Bonds.

Investors Obligation To Agricultural Industry

(*Continued from Page 9*)

his liability into an asset. A machine that has to lie idle waiting for repairs, or from the inactivity or short-sightedness of its owner, is eating its head off by interest on the investment.

Local bankers should encourage the purchase of right machines, and also encourage the activity of the farmers with their machines, as activity means a betterment of production, enhances the values of properties and incidentally brings more and better business to the banks. The banker can benefit his community immeasurably when extending credit to the tractor dealers, by doing so only to those who handle machines that will be a benefit and not a detriment to the farmer's best intereats, as the farmer's interests are his also.

Assuming that the tractor has done its full duty in preparing and planting the seed bed, the work and worry does not stop there. The crops have to be harvested. Little attention has been given to develop harvesting machinery to keep pace with tractorized tillage development or the production of labor-saving harvesting equipment to balance the power of the tractor. Anyone conversant with farm work knows something of the losses in crops at harvest time due to shortage in labor and inadequate cutting equipment. This is particularly so in connection with hay and grain crops. There is little use in opening up additional land because the tractor makes it possible, if part of the crop is to be lost on account of lack of proper harvesting machinery.

Pictures are often displayed in agricultural journals showing tractors pulling several mowers or binders, each of which is commanded by a man as pilot, besides the man on the tractor. This arrangement is no saver in labor requirements. Such machines should be so designed that the man on the tractor operates his machine and the harvesting equipment as well. The idea of the tractor's pulling several harvesters after it is interesting to the harvester maker but is costly to the farmer and gives him the worry of getting the additional men to steer the harvesters. A good tractor has great power but that power should not be wasted in pulling a lot of additional iron around a field when a simpler and more effective equipment will do more work with less help and lower fuel consumption.

Tractorization has come to the farm to stay, and to the farm must also come improved tillage and harvesting machinery that will be adaptable to the new tractive power.

Agriculture and World Welfare

Agriculture is the most important work in the world. The degree of its advancement in a country is the measure of the prosperity of that country. The return from the land is the barometer that not only indicates but makes the real wealth of a country, fosters interchange between countries and is the foundation upon which manufactures are built. Then why not promote it to the fullest extent? Put the farmer on a manufacturing basis by giving him high production, thoroughbred machinery that will give him a maximum in production on a minimum labor cost. It is possible, with properly designed equipment, for the farmer to produce with one man what now requires ten men to accomplish.

Advancement of civilization and national progress depends on the productivity of the farm and greater development of equipment to promote such production increases manufacturing within the cities.

By what means may the capitalist or investor promote the increase in farm production? He is not asked to purchase lands, or take stock in the farmer, direct, but where new developments have been made in high production machinery for the farm, and new corporations are organized to manufacture such machinery, his investment in such institutions will be a long step toward increasing farm production.

That will be helpful co-operation between the city and the farm country.

ENGINE & THRESHER CO. ELECTION

The Port Huron Engine & Thresher Company, Port Huron, announces the election of A. E. West as president and of D. C. Kinch as general manager. Mr. Kinch formerly was with the company at Port Huron but was later made manager of the branch in Peoria, Ill. The company has not resumed operations, but it is expected that activities will begin soon.

Banking And Foreign Trade

(Continued from Page 10)

The type of corporation authorized under the Edge Act has proved to be profitable in English experience, paying dividends of about 12 per cent, as has been previously stated. The efficiency of American management, together with the restrictions which may be imposed by the Federal Reserve Board, calculated to safeguard both the stockholder and the debenture holder, should make these new corporations both profitable to the investor and helpful to commercial development.

Such plans as these to promote our export trade of course require the co-operation and support of the banks of the country. The American banker perhaps has not quite the vision of ultimate advantage to be gained from foreign trade as has his European neighbor. He is often too well satisfied with the visible results of domestic enterprise. It must be remembered, however, that present conditions, which are by no means satisfactory, grew out of world conditions; that the United States must always be affected by world adversity or world prosperity. It is thus the duty of the banker to do all he can to promote the return of world prosperity by supporting such organizations as the Foreign Trade Financing Corporation, for in so doing both he and the community he serves will prosper.

MONROE PAPER PRODUCTS

The annual report of the Monroe Paper Products Company, Monroe, sent to the stockholders last week, featured the statement that brokers already had solicited the company for contracts for the sale of the entire output for two years. No contract, though, had been entered into. No difficulties in disposing of the product were expected and it was said that by the annual meeting probably the company would be able to show good earnings. The new mill probably will be running by next July. The directors had contemplated for some time the matter of erecting a box factory in connection with the mill, to enable the company to reap increased profit from the product manufactured. The cost to date of the new mill has been $168,000 and it was estimated that it would take $10,000 more, while the minimum estimate made at the time of construction was $175,000 and the maximum $200,000.

Election of officers resulted as follows: William R. Harris, president; Thomas I. Ilgenfritz, vice-president; J. T. Upjohn, Kalamazoo, and William G. Gutmann, Ed G. J. Lauer and George M. Martin make up the board of directors. A. Blum, treasurer. These officers and Dr. vice-president; Roy M. Sperry, secretary; George

A Service of Facts

Through contact with every phase of big business, and as a result of the exhaustive and constant study of economic conditions which is essential to the safe conduct of a great bank, the National Bank of Commerce in New York is able to render to its friends a peculiarly valuable service.

Broadly speaking, we are in a position to supply authoritative information, drawn from original sources, on practically every important matter related to commerce and industry, whether national or international.

Our friends, in this sensitive period of adjustment, are invited to employ this service to the fullest extent.

How Motor Bodies Are Made

(Continued from Page 18)

At the left, finished assemblies are shown undergoing final touches and inspection. These are Paige models. The photo at the right shows how sheet metal plates are stamped. Huge presses make hundreds of these shapes daily. Photos from C. R. Wilson Body Company.

be left standing many times longer and be subject to atmospherical variation. As it is, the body never leaves the conveyor very long and the floor space is always free for the constant flow of work. The same feature is true of the chassis painting. Perhaps the automobile manufacturers will be remembered for this contribution to industry generally, as it has been quite generally admitted that the need for conservation of space in painting of large assemblies gave greatest stimulus to the development of this method of painting and drying.

To a great degree, the processes herein described, with slight modifications and variations, are standard for all wood and sheet metal body construction. Of course the special body building industry has many ramifications but, for the most part, the system outlined is found most generally in use. There is some variation in lumbers used. Ash goes into a large number of high-class jobs and white maple serves for others. Cheaper cars use much ordinary maple. The demand of the Government for ash in airplane construction attracted attention to this sturdy member of the forest family and it is in great demand by builders of quality automobiles.

The manufacture of heavy type steel bodies is an industry of large equipment. The little punch press that makes holes for sheet metal plates on light bodies gives way to the multiple air drill and the tapping of the hammer is replaced by the riveter. These bodies must stand for severe punishment and great strength is built into them.

Just as the body building industry lies within the great automobile field, behind that too is one which it creates. That is in the manufacture of body hardware and fittings. There are plants all over the United States which devote themselves to producing hinges, knobs, locks, windshields, ventilators, and many other articles that the builder of a car for comfort seems to feel his public requires. There has been considerable development in this direction and the automobile hardware field has produced some notable contributions to the progress made in design and toward perfection.

6,000 a Day in This State

It would be extremely difficult to approximate the output capacity of Michigan's body plants. The larger units which manufacture on quantity production methods and schedules are capable of indefinite expansion. Even during the recent period of heavy output, the utmost capacity of these plants was not demanded owning to shortage of labor. Altogether, it should not seem excessive to approximate the possible capacity output of all types of bodies at 6,000 a day for Michigan. This estimate is based on statements by several production men in units of different kinds, although no reliable computation has ever been made.

Michigan has about 50 manufacturers of bodies. They are classified in the records of the industry as makers of passenger bodies, wood and metal, commercial car bodies, wood and metal; special bodies, and special dump bodies. They are pretty well scattered all over the state, although southeastern Michigan has the most important ones. The C. R. Wilson Body Company; Fisher Body Corporation, a unit of General Motors, and Briggs Manufacturing Company rank with the most important ones. Others in Detroit are: Erdman Guider Company, Griswold Motor & Body Company, Hayes Manufacturing Company, Model Body Corporation, Reiss Body Company, J. C. Widman Company, Continental Trailer Corporation, Mansfield Steel Corporation, Andrew C. Sisman Company, Automobile Body Company, Bennett, Sustrich Company, R. Joynt & Sons, Procter-Keefe Company, Trippensee Manufacturing Company, Transportation Equipment Company, Wood Hydraulic Hoist & Body Company, Columbia Body Company, Kelsey Wheel Company, Seiden Manufacturing Company and American Motor Body Company.

Lansing: Anto Body Company, Lansing Body Company, Lyons & Company, Michigan Bridge & Pipe Company.

Owosso: Field Body Corporation, Detroit Weatherproof Body Company; Jonesville: Universal Body Company; Jackson: Briscoe Motor Corporation; Lowell: Lowell Auto Body Company; Lapeer: Neposaing Manufacturing Corporation, John H. Whetstone & Company. Kalamazoo: Limousine Top Company; Grand Rapids: Michigan Hearse & Motor Company; Bay City: Bay City Auto Body Company; Muskegon: FitzJohn-Erwin Manufacturing Company; Mount Clemens: Mount Clemens Truck Body Company; White Pigeon: Standard Body Company; Pontiac: O. J. Benedette, Pontiac Body Company; Flint: W. F. Stewart Company.

LANSING BUYERS NAME OFFICERS

The Lansing Buyers' Club was organized at a meeting at the Chamber of Commerce last week, and will be affiliated with the National Association of Purchasing Agents and the Western Michigan Association of Purchasing Agents. The membership represents the leading concerns in the city. The officers elected are: President, C. C. Richardson, Motor Wheel Corporation; vice-president, L. D. Maxson, Olds Motor Works; secretary and treasurer, E. W. Goodnow, Atlas Drop Forge Company.

INDICATOR CONTROL CHANGES

Announcement has been made in Grand Rapids that the Patterson-Warner Company, Chicago, has purchased a substantial part of the stock of the Auto Indicator Company, Grand Rapids, which concern soon will be increasing its production as a consequence. Instead of five members of the board of directors, the company now has seven, one of the new members being E. C. Patterson, head of the Chicago concern, and the other, C. B. Hamilton, of the Brearly-Hamilton Company, Grand Rapids. The Patterson-Warner company recently increased its capital stock to $1,500,000 The Grand Rapids concern has thus far made and sold approximately 35,000 indicators.

STUDEBAKER SELLS WAGON DEPT.

The wagon department of the Studebaker Corporation has been purchased by the Kentucky Wagon Manufacturing Company, Louisville, Ky., which thus becomes probably the largest wagonmaker in the country. The Kentucky company has a capital stock of $1,500,000 and $1,000,000 of surplus. Its output will be increased to 60,000 wagons a year. Studebaker announced recently that it was about to discontinue the manufacture of horse-drawn wheels. The Kentucky Wagon Manufacturing Company also makes the Dixie Flyer motor car.

WOODRUFF JOINS BRISCOE

C. A. Woodruff, formerly purchasing agent for the Chalmers Motor Company and later general manager of Saxon, has been appointed purchasing agent of the Briscoe Motor Corporation, Jackson, according to announcement of the president, H. F. Wardell.

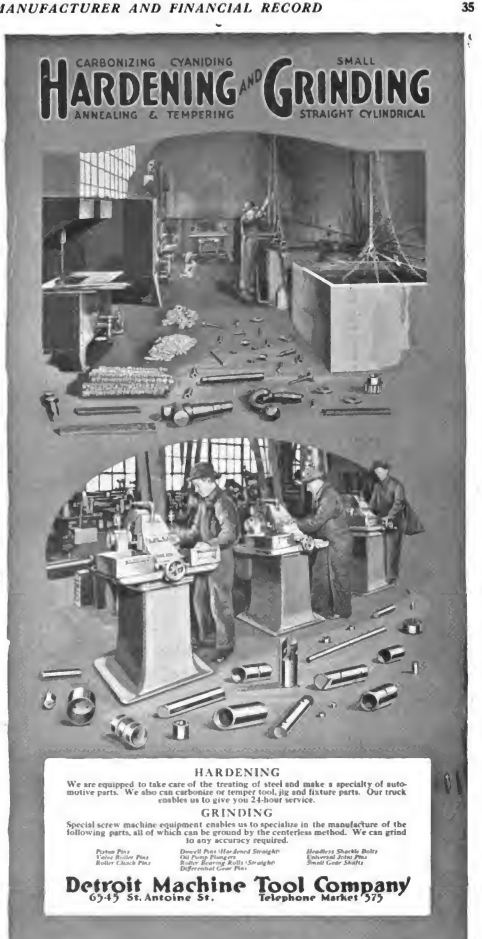
ANOTHER OVERLAND RESIGNATION

The fourth resignation from among the higher officials of the Willys-Overland Company, Toledo, was announced last week, when it was stated that J. H. Gerkens, assistant treasurer, was acting in the capacity of treasurer owing to the retirement of Treasurer Frank K. Dolbeer, who had been with the Willys organization many years. Previous resignations of executives of the Overland company were those of Vice-Presidents Clarence A. Earl, LeRoy Kramer and E. B. Jackson.

DODGE HEADS CLEVELAND BRANCH

The Baker-Fisk-Hugill Company, Dort distributors, Detroit, announces the appointment of Frederic N. Dodge as manager of the Cleveland branch. Before joining Baker-Fisk-Hugill Mr. Dodge was assistant advertising manager of the Dort Motor Car Company.

AJAX RUBBER LOSES $177,920



The 1920 business of the Ajax Rubber Company ended with a loss of $177,920, as compared with a profit of $2,201,267 in 1919 and $2,379,187 in 1918. After taking care of dividends and adding previous surplus, the profit and loss surplus was $1,615,481, as compared with $2,128,848 in 1919.

WHITE MOTOR PROFITS $2,410,014

Everything considered, 1920 was a satisfactory year for the White Motor Company, Cleveland, which makes the White trucks. Total sales were $51,998,122, as compared with $41,667,696 in 1919, and net profits $2,410,014, as against $2,869,875 in 1919. The decrease in profits was due principally to charging off $1,193,927 on inventories to bring them to present market prices; to deduction of $51,206 lost on sale of government bonds, and allowing $300,000 for federal taxes.

W. H. HOLMES LEAVES PACKARD

W. H. Holmes has resigned as advertising manager of the Packard Motor Car Company and will return to the agency field on April 1. He has been at the head of the Packard advertising department two years.

HARDENING

We are equipped to take care of the treating of steel and make a specialty of automotive parts. We also can carbonize or temper tool, jig and fixture parts. Our truck enables us to give you 24-hour service.

GRINDING

Special screw machine equipment enables us to specialize in the manufacture of the following parts, all of which can be ground by the centerless method. We can grind to any accuracy required.

Piston Pins
Valve Roller Pins
Roller Chain Pins
Dowell Pins (Hardened Straight)
Oil Pump Plungers
Roller Bearing Rolls (Straight)
Differential Gear Pins
Headless Shackle Bolts
Universal Joint Pins
Small Gear Shafts

Machinery and Power Equipment

Our Aim is to Render Service

COMPLETE EQUIPMENT

FOR

Tool Room, Production Shops, Sheet Metal Shops, Pattern Shops, Body Plants, Automobile Repair Shops, Heat Treating Plants, Wood - working Plants, Iron and Metal Foundries.

Auto Body Plants, whether custom or large production will find the following machines, selected at random from our stock of 1,000 new and used machines on our floor, very desirable for their work:

1—No. 112 Crescent Universal Wood Worker, complete, used.
2—36" Crescent Band Saws, belt drive, new.
10—Swing Saws, new and used, Crescent, Porter and Moak make.
1—American Jig Saw, used.
1—Two-Spindle Boss Shaper, complete, used.
1—Two-Spindle Porter Shaper, complete, used.
1—24" Crescent Planer, var. feed, new.
1—26" Crescent Planer, var. feed, complete, used.
1—36" 3-drum Berlin Sander, complete, A-1.
10 more different types, all size of desirable wood-working machines, well known makes, new and used.
A complete stock of new Temco portable electric driven tools, ideally suited for intermittent service.
A complete stock of new D. & R. Teal Co.'s well known line of el. portable tools, best adapted for heavy duty constant service.
Our stock of new D. C. and A. C. Watson Motors, all sizes, speeds, etc., is as complete as desired.

We carry a well assorted stock of new and used transmission, belting, etc.
We have over 35 new Michigan O. B. 1. Punch Presses in stock for immediate delivery.

WE SELL THE FOLLOWING WELL KNOWN MAKES OF SUITABLE MACHINES:

Peerless Line of Foot and Power Steel Squaring Shears.
Pettingell Machine Co.—especially bumping hammers, mitre saws and tenoners.
Quickwork Co.'s line of Rotary Shears and Bumping Hammers.
Yoder's complete line—mostly hammers and fender machinery.
Agnew complete line of spot welders—a size of machine for every job. In short—we can supply everything required for body plants.
We have a copy of our latest list ready for you.
Our only aim is buying, selling, trading or exchanging only high equipment.
We must satisfy you.

MILLER RUBBER REPORT

Although sales of the Miller Rubber Company, Akron, for 1920 totaled $32,891,670, as compared with $26,495,482 in 1919, an increase of $6,396,188, the year ended with a deficit of $617,878, due especially to the shrinkage in inventory. In a statement to the stockholders President Pfeiffer said that the shrinkage aggregated $8,193,086 and payments made on settlement of contracts, to $215,951. Net profit prior to the charging-off of the items referred amounted to $2,791,158, practically all earned in the first six months of 1920. Based on the conservative valuation of the inventory, the company had current assets in excess of $14,000,000 on January 1, 1921, of which approximately $2,000,000 was cash. Its current liabilities aggregated $8,676,900.

COAL PRODUCTION SMALLER

There was a further decrease in output of bituminous coal during the week ended February 26, according to the report of the Department of the Interior. The total was 7,334,000 tons, as compared with 7,493,000 for the previous week and 7,859,000 for the week of February 12. Anthracite production also dropped rather considerably as compared with previous weeks. The output was 1,525,000 tons, or 185,000 less than the previous week. Carload shipments also decreased. The drop is attributed to the observation of Washington's birthday.

WELCH ON U. S. TIRE BOARD

C. J. Welch, assistant general sales manager of the United States Tire Company, has been elected to the directorate.

The New Secretary of Labor Has a Mind of His Own, Says Detroit Attorney Who Knows Him Intimately

By F. W. HERSEY

FOR the better part of eight years Samuel Gompers, president of the American Federation of Labor, has had a snaffle bit on the national administration—the United States Department of Labor in particular. With Mr. Gompers at the helm of organized labor, on the outside, and his son, Gompers Junior, as chief clerk of the labor department, on the inside, the cards have been continually stacked for unionism and against unorganized labor, its employers and the unclassified public between the milestones.

But now the Wilson administration has folded its tents and silently stolen away, and as quietly the Harding administration has taken up its duties in the Capitol. President Harding's cabinet selections have been made and, if not entirely approved, they have not been entirely disapproved by the public. It is too early for expressions of favor or disfavor. The test of quality and policy is yet to come and very likely the first challenge will be buried at the United States Labor Department. In fact the challenge already has been foreshadowed. And the man who will carry it is Samuel Gompers, leader of organized labor.

Why Was Davis Picked?

The man destined to try conclusions with labor and its leader is James J. Davis, Secretary of Labor in the Harding cabinet. During the eight years that Mr. Gompers was first cousin to the Wilson administration Mr. Davis, as director general of the Moose organization, has been busy laying out and developing Moosehart, that great colony of Moose widows and orphans near Chicago. Mr. Davis was a great Moose; otherwise he was not in the public eye.

Mr. Harding's selection of Mr. Davis as his labor lieutenant undoubtedly has created no end of surprise, not only because he was such an inconspicuous figure in national political life, but more because his connection with organized labor was so indefinitely drawn. Consequently the questions in the minds of politicians, employers and workers are: Who is this man Davis? Why was he selected? What will be his general policies, and toward which side of what has come to be recognized as a great controversy will he lean?

It so happens that Detroit has a citizen who knows probably as much about James J. Davis as any other person outside of the Secretary's immediate family. That man is Antonio P. Entenza, lawyer, Loyal Order of Moose leader and in certain circles referred to as a radical in political thought, a reputation which Mr. Entenza does not seek to deny. Mr. Entenza so admires "Jim" Davis, as he calls him, for the qualities that make men "pals" that he can talk about him for hours. On the other hand, Jim Davis reciprocates in kind and to such an extent that no sooner had he accepted the portfolio of Secretary of Labor than he offered Mr. Entenza the post of chief counsel of the labor department.

It is not within the power of human nature to be perfect; therefore the best test of the sincerity of anything Mr. Entenza may say of Mr. Davis is to find and analyze the faults Mr. Entenza finds in Mr. Davis and which might or might not lead to differences. These faults, as Mr. Entenza sees them, are two in number: Extreme conservation in labor thought and an objection to the use of profanity. Mr. Davis never swears.

"I never could understand that," Mr. Entenza said. "Jim does not smoke, drink or swear. I can excuse and admire his abstinence from the use of liquor or tobacco. The fact is that Jim is the kind of a scout who would buy the liquor for his friends to drink if it made them happier. But I never could understand the self-control that prevented him from cussing when things did not go right." The other fault is conservatism, of which more will be said later.

Mr. Entenza turned down the offer of a post in the labor department for two reasons, he says. First, he did not feel he could leave his law practice for a position paying only $5,000 a year. Secondly, he might have been willing to sacrifice the income had he been entirely in sympathy with the Davis conservatism—had he been willing to set aside his political theories for less pronounced views more in keeping with the Davis principles, and he realized full that his presence as legal adviser to the Secretary might prove embarrassing. These are Mr. Entenza's reasons as expressed.

Started as a Metal Worker

Mr. Davis was born in Wales, spent his early childhood in Anderson, Ind., and was a resident of Pittsburgh when called to the Harding cabinet. For the rest we shall quote Mr. Entenza:

"I first became well acquainted with Jim Davis when he was a metal worker around Sharon, Pa., and I was a cigar maker. We both were union card men. Jim was just a plain card man. He attended the meetings and paid his dues. He believed in trade unionism with all his heart, but in all the fifteen or twenty years I have known him I never knew or heard of his holding any official position in the union. In fact I never knew him to take any part in union politics.

"Davis is not an educated man as the term is usually applied. I believe the extent of his schooling will not exceed eight months. He had to work for a living when he should have been in school. During the days we "pailed" together he often regretted his lack of education and looked forward to the day when he might go to school. That day never came, but he educated himself by that hardest of methods spare time study. He read a great deal and his principal indoor sport was practicing handwriting. As a result he writes a beautiful hand.

"One thing his associates are going to find out very soon is that Secretary Davis knows the labor problem as few men know it, and not from book-made theories or doctrines. He knows it first hand. During the days he worked at his trade he associated with working men in all trades. He learned something of the trend of every man he came in contact with. He has said to me more than once: 'The trouble with a lot of union leaders is that just as soon as they get into office they forget the men they worked beside. They become organizers, conscious only of organization and its power. They lose personal touch and personal sympathy with each individual workman. Personal ambition often leads them to put self before the very principles which they are in duty bound to uphold and practice.'

"Jim studied hard. He was thrifty, as becomes a Welshman. He saved his money and even as a workman he made small investments. I know of one occasion when he bought stock in a steel plant in which he was working. His first step out of overalls was as county clerk in Anderson, Ind. It was likewise his first shot at politics. Jim was always a popular fellow, and popularity elected him. I think his campaign for county clerk brought his organizing ability to the fore.

His Work for the Moose

"At any rate when he joined the Loyal Order of Moose as the 247th member in an organization now numbering 600,000, almost immediately he was recognized as a leader and an organizer. All that the order has done in a big way it owes to the vision of Jim Davis. It was his idea that the Moose should be the benefactor of the widow and the fatherless or motherless children. Moosehart was his idea. He said to me once: 'These things, dreams if you choose to call them that, I desire accomplished are to me the nearest approach to those principles which should govern trade unionism.'

"I think that Jim's inherent love of children has made him a great man. He has two of his own, he is educating several at his own expense, and his plans for Moosehart were all built for and around the problems of helpless childhood. His careful planning has made it possible for the children in Moosehart to learn trades, get a high school and college education if they desire it, and if not, a union card immediately upon their graduation from their trade course. I mention these details because they point clearly to the type of man who hopes to bring labor and capital closer together as Secretary of Labor.

"I like and admire Sam Gompers. You see I have his photograph on my wall. I know Jim Davis better and consequently my affection for him is deeper. I know that Gompers, nor any other man can or will put a snaffle bit in Jim Davis' mouth. He is gentle, conciliating and humorous, but once his mind is made up he is as immovable as the Rock of Gibraltar. I sit with him on the Moose board as a director.

The Board of Commerce and the Future of Detroit

By JOHN A RUSSELL

[Part of an address written by Mr. Russell, as vice-president of the Detroit Board of Commerce, and read, in Mr. Russell's absence, by Arthur T. Waterfall, vice-president of the Board, at the banquet last Saturday evening, which marked the culmination of "Detroit Week."]

THE Commercial future of Detroit is bound to be one of progress. No city which has assembled an industrial army of three hundred thousand men and women; which has accumulated a population of a million within its boundaries and a million and a third within twelve miles of its center; which has within half a generation of the lives of men transformed its industrial processes from those which characterized unit production into those which mark quantity production; which has destroyed its old types of industrial structures and replaced them with modern types in which the health, the safety and the convenience of the workers are conserved and in which the processes of fabrication follow in orderly sequence without waste of time, reversal of direction or effort mis-spent in producing un-inspectable product, no such city can fail to go forward industrially from lack of workers or adequate facilities unless its people deliberately defeat their own purposes.

A city which has developed so high a sense of merchandising that its staple products may be found in every community of its own country, and in some further quantity in every commercial center of Europe, and which find sale in far Cathay and in those islands of the sea in whose skies shine the stars of the Southern Cross, can fail to go forward as a merchandiser unless its own people fail to keep pace with the progress of its contemporaries and competitors.

The stage has been set for the commercial future of Detroit. The actors and the play depends upon the actors and the management.

ASSUMING that we have the men to make, the factories in which to fabricate and assemble, the captains of industry to plan and direct, and the normal and up-to-date organizations for salesmanship and marketing, two lines of thought open up in respect of our commercial future. One has to do with the enlargement of our markets and the development of facilities for reaching them. The other has to do with local conditions which affect industry and commerce more than we ordinarily credit them. Let us leave the homelier considerations for the last and look at the more striking ones.

We are an inland city, nearly a thousand miles from the nearest seaboard. Having taken our share of the domestic demand and being assured that we can hold our own in the future, we, and by we I mean the directors of this Board of Commerce, have attacked the problem of exportation. Our attack began along the lines of bringing the seaboard to our very door. Last year we collected and formally presented the supporting facts for our claim that our own government and that of our friendly neighbor, Canada, should undertake a work of reforming the face of nature less gigantic than that of putting a canal through the Isthmus of Suez, less expensive than the making of the waterway from Panama to Colon, not more costly than the opening of the Manchester Canal in England, but more useful to us here in Michigan than all three of them put together.

So impressive was the array of figures presented by this city and state that the distinguished chairman of the International Joint Commission, the Honorable Charles McGrath of Canada, and former Senator Obadiah Gardner, for the United States, did this Association the honor of saying that the facts presented by this city of Detroit would alone justify the making of a waterway to the sea from the shores of our city to the Gulf of the St. Lawrence.

BUT our duty did not end in that effort. Spasmodic enthusiasm has about as much motive power as Chinese firecrackers.

If we are to follow up the work begun last summer and autumn, we have full ten years of study and work ahead of us, and the expenditure of not less than a quarter of a million dollars of money by this Association, for this city and for this state, to give it an outlet to the open sea with its products, and once upon the open sea, to every consuming port of the world.

The Germans taught us the science of building up an export market. They sent their own people abroad to be in constant contact with their foreign consumer, to study his tastes, to meet his demand and to make sure that he paid his bill sometime, with interest accruing for every month of delay.

That was a national program, but it was a provincial and municipal one as well, conducted no more by the nation than by provinces like our states, and cities like our cities. Match Saxony with Michigan, match Essen with Detroit, match Merck with Parke-Davis, match Krupp with American Car & Foundry, and you translate the terms of German export exploitation into Michigan English. Export is an aggregation of unit efforts and unit efforts can be made, and must be made, to be effective, by associations like ours.

It seems as if it were but yesterday, and yet it was five and twenty years ago that we entertained in this city Doctor Paul Zilling, the representative of the Commercial Museum of Stuttgart, who was finding out what we Detroit and Michigan people used which Stuttgart could make, and going home and telling his people what it was and how to make it, and finish it, and market it.

Translate Paul Zilling into John Smith, and the Commercial Museum of Stuttgart into the Detroit Board of Commerce, and you have the reverse of the commercial equation set up by the Germans.

It seems as if but yesterday, and yet it was a quarter of a century ago that a splendid Austrian Jew, Herman Linde, who sang like Ruffo, who played like Josef Hoffman, who read Shakespeare like Booth, and who boasted that he was as much at home on Woodward Avenue as he was on the streets of Alexandria or Tunis, dropped in on us summer after summer to study how we could absorb Austrian linens and Bohemian glass products. He was the emissary of the Vienna Bourse.

Translate Herman Linde into John Brown, equip him with the social graces of the ancient regime of Detroit and the energy of its present day, sign his warrant of authority with the name of the Detroit Board of Commerce instead of the Vienna Bourse, and you have turned some more European exportation of export trade into understandable Detroit English.

IT SEEMS only yesterday, and that again was two decades ago, since a polished Japanese, Mr. Wooyeno, walked Woodward Avenue season after season, pad and pencil in hand, and sketched the shapes of the newest designs in pottery which met the favor of our local buyers. These designs went by the fastest ships back to Japan, were reproduced in quantity, three months later were peddled by a smart Irish salesman, Mr. Woolley, at his favorite price of a dollar a million, and were bought by your neighbors and mine over the counter of Hudson's store and Heyn's Bazaar.

Translate Mr. Wooyeno into Jimmy Jones, his principal into any Detroit producer, his mission for salesmanship in Detroit for Japan into salesmanship in Japan for Detroit, and you have the reverse of a picture which I, myself, have seen.

We have the men. Others are using them and have used them. Fred Monahan, raised on Columbia street in this city, a mile from where you are sitting, introduced the American Radiator products into all of Germany and France. Edward Quarles, a Detroiter who is a member of this Board, is today finding a market for American Petroleum productions in Germany. "Bill" Church, who used to pound pills in a drug store on Cass avenue, is selling American Drug Products as the head of the biggest organization in the British Isles. Frank Karpp, a Detroit boy, has princely offices in the King's Chambers at Bombay selling petroleum products for the Texas Company. A missionary in Zanzibar, Father Geotz, who lived for years in Detroit, gathers up an order once a month for Detroit medicines. The chief clerk of the manager of the railway which runs up from the coast of Africa to Nairobi, in the heart of the continent, is a boy from Mount Pleasant, who is a missionary for the products of this city and state, who is making a market for you without pay.

LAST WEEK a learned Pole, for fifteen years a resident of this city, opened up on his own account a study of a project for an actual barter of the linen products of his native country for the automobile products of this city, with none of the hindrances of diverse money values.

Do these instances show us the place of the Detroit Board of Commerce in the future commercial possibilities of this city?

What Detroit Plants Are Buying

A Review of the Purchasing Situation Existing Today And an Estimate of the Men Who Are Doing the Buying

By ELWOOD SAMPSON

Chairman, Public Relations Committee, National Association of Purchasing Agents, Detroit

THERE are very few business men who thoroughly understand the particular position which Detroit holds as a buying center.

Detroit's commanding position in the sale of automobiles, of stoves, of drugs, etc., has been made known to all the world. But almost no attention has been given to Detroit's commanding position in the purchase of the wide range of commodities necessary to provide for the manufacture and sale of the above products. In fact there is no city in the whole country which ranks so highly as a buying center in the sense of the large number and variety of commodities required. Even more so is this true in the large diversity of commodities where a highly developed, scientific buying knowledge is of such great importance.

In the other large buying centers of the country expenditures for materials are concentrated in a few particular kinds. Also, these immense purchased generally are confined to materials in the raw state or very close to the raw state, where a knowledge of an infinite number of gradations and specializations is not required.

In Connecticut, the greatest manufacturing center in the world of brass and copper, the immensely important purchases are limited almost entirely to the raw metals of copper and zinc, and to fuel. In New England, the textile center of America, the immensely important purchases are cotton, wool, silk and jiuen in the raw state. In Pittsburgh, the leading steel center in the New World, the tremendously important purchases are limited almost entirely to iron and fuel in the raw state.

But when we come to consider Detroit as a buying market, we find that purchases are not confined mainly to a few exceedingly important forms of raw material. Also, each of our important articles of purchase is only a small fraction of the tremendous quantity of each principal raw material ordered in the Eastern centers. Instead, they are spread out through an immense range, both of materials and of specialized forms of each kind of material.

This is particularly true with reference to the purchase of the materials required in the manufacture of automobiles. Every one of the common metals and almost all of the rare metals are required in large enough quantities and in special stages of manufacture to make necessary thorough and detailed purchasing knowledge and to produce intricate purchasing problems. This also holds true with reference to the purchase of a wide range of petroleum products; of paints, varnishes and japans; of electrical equipment; of glass; of lumber; of fuel; of leather and of textiles.

The natural result to be expected from this situation is that the purchasing agents of the Detroit territory will be different in many respects from the men holding the men holding the same positions in the other buying centers.

Comparing the two, we find, first of all, that inasmuch as Detroit is the youngest of the large industrial centers of the country, the purchasing heads average much younger in age than do the men with the same responsibility elsewhere. Youth produces activity, and age experience and knowledge. Accordingly we find that when it comes to the volume of work handled individually, the Detroit buyers far surpass those of any other part of the country. On the other hand, the Detroit buyers do not have so great a detailed knowledge of the various materials which they purchase as is true of other parts of the country. This condition is to a great extent enhanced because Detroit buyers have so many more kinds of important materials to purchase.

As was pointed out in a previous article by Mr. Hersey in this paper, the big problem of the past in the automobile industry has been production on a continuously increasing scale. This has reacted upon the purchasing department in a speeding up of "production of orders" and in continually getting material in quickly at the last moment. As a result, when it comes to getting things done in emergencies, Detroit buyers rank the highest of any city in the country. But this continual emphasis upon speed of incoming shipments has carried with it a corresponding lack of detailed knowledge of economic conditions, of price trends, of price analysis and of ability to get the greatest value possible in every purchase made. In all of these last factors the purchasing agents of Detroit, as a class, have been outranked. For in every other part of the country the industrial development is an older one than it is here. Industrial conditions therefore have passed through the stage of rapid growth into the stage of keen competition where only the strong survive.

When an industry reaches the point of keen competition, the ability of any firm to purchase rightly is an exceedingly important factor in the ability of that firm to succeed in the face of competition. When that stage has been reached, that firm must have a purchasing head who is far sighted, who knows economic conditions and what effect each condition and factor will have on the price and delivery of each commodity which he is buying. He must have developed that instinctive sense of values which will tell him whether a price quoted to him is too high or not, even though he receives only one quotation.

He must have a detailed knowledge of the properties of materials which he purchases and a general knowledge of the manufacturing processes of his own company. This is essential in order that he purchase the one kind and grade of material which will produce the lowest unit cost of manufacture in his own plant. And, more than all these, he must keep always in mind the relation of the thing he buys to the thing his

—Darling in Collier's Weekly.

Recovery will be more rapid when we have a little better hospital discipline.

Digitized by Google

company sells, so that in his purchasing he does nothing whatever detrimental to the good will and reputation which his company has taken so much pains to build up.

It takes only a moment's consideration of these qualifications to make it apparent that the purchasing position of a company should not be filled by any other than a high calibered man. Too many factors necessarily are involved; too much knowledge, clear-headedness and balanced judgment is required for it to be possible of any except a high-grade man to measure up to the conditions.

What It Means to the Manufacturer

The understanding of the importance of the purchasing division of a firm is something which every manufacturer in this territory is going to find it increasingly necessary to bear in mind.

Automobile executives are almost unanimous in agreeing that the automobile industry has now reached its full growth. As a result, the big problem of the future will be primarily a sales one. To solve this the automobile manufacturer will more and more strive to build a car high enough in quality and low enough in price to be sold in the face of keen competition.

With the problems of manufacturing, production, sales, etc., necessary to face the new situation, this article is not concerned. These problems, anyway, are already being given intense study and consideration. In so doing, however, the corresponding importance of purchasing should not be forgotten. It is to believe that the importance of this fact will be overlooked, if a thorough consideration is given to the relative strength in a financial sense of the various large companies in this territory, and to the relative strength in a buying sense of the same companies. These two factors almost invariably closely parallel each other. Take for example the Studebaker Corporation. It is known as one of the strongest companies financially in the motor car industry. It is more than a coincidence that throughout the profession of buying the Studebaker purchasing department is conceded to be one of the very strongest in the motor car companies. Correspondingly, on the other hand, certain of the motor car companies which have been in financial difficulties have purchasing departments of very poor standing in the profession of buying.

I emphasize this ranking in the profession of buying because it is true that the best men in any profession are those men who through their professional ability have been able to gain the highest respect of their own profession, whether it be that of law, medicine, engineering or purchasing.

Proceeding further with the analysis of the Detroit buyers, we find one thing that the purchasing agents of Detroit have developed, almost without exception, is the ability to meet and overcome the biggest emergencies. This particular outstanding feature has produced a big change in the Detroit buying profession during the last six months.

The immense inventories which their companies now have has proved to be a tremendous lesson to most purchasing agents. They now feel that they should not have been satisfied blindly to follow instructions given to them by the managing executives of their respective concerns. Instead, they individually should have studied in advance the conditions much more thoroughly than they did, so that they would have been in a position at all times to give in advance expert advice concerning the general buying policy which should be carried out by their companies.

The prosperity of the past has been such that most business men have unavoidably grown more or less stale. This has not held true in the purchasing departments, because, to obtain material in the seller's market has required the finest kind of keen wittedness and alert mindedness. This mental state has enabled the buyers to appreciate fully and immediately the change in conditions—to recognize clearly the part their respective companies must do to face the new condition and to judge carefully what they themselves must carry out to do their part.

Consequently, at present a more careful study of the economic conditions is being made. Particularly are old sources of supply being thoroughly gone over, analyzed and weighed in the scales of the new conditions. Many of these old sources of supply—a great many, in fact—are being found wanting in the sense that their management and organization has grown stale; that they have acquired uselessly expensive habits of manufacture; that they are loaded up with many unnecessary procedures and that they have lost the knack of manufacturing and selling profitably at a low price.

Analyzing Sources Anew

Accordingly, a thorough study is now being made of prospective new sources of supply to replace those who cannot measure up to the necessities of the future. Past records are not being forgotten by purchasing agents. In fact they were never more generally remembered in a buyer's market than they are at present. On the one hand, it is bad past records which will force many firms out of the Detroit market. On the other hand, every firm with a good past record must avoid the mistake of trying to live on its record. Other things being approximately equal, such firms will get the preference in the years to come. But no

Facilitating Money Movements to Poland

By FRED W. ALLEN

Manager Foreign Exchange Department, American State Bank, Detroit

AN ITEM of interest to bankers throughout the country was released last week by the Guaranty Trust Company and the National Bank of Commerce of New York, and concerns remittances of Polish marks and dollars to the Republic of Poland.

Immediately after the signing of the Armistice it became apparent to the bankers in this country that this newly created sister republic would need the need of financial assistance as much, if not more so than any of those so hard hit by the world conflict.

Through the personal efforts and under the direct supervision of our present Secretary of Commerce, Herbert Hoover, arrangements were made for the transfer of American funds to Poland and other war-stricken countries in Europe, such funds being transferred in the form of "food drafts." These "food drafts" are drawn upon the warehouses of the American Relief Administration and are payable in wholesome food for a fixed quantity as stated upon the face of the draft.

The importance and value of these food drafts are inestimable and they relieved the situation from the standpoint of hunger and starvation in a most commendable way.

There is a great necessity, however, for the transfer of funds to Poland to be used in the purchase of other commodities and to this end the banks in this country have been striving to perfect a service that would insure accurate and expeditious handling of these funds.

Connections were established in the principal cities of Poland, such as Warsaw, Lemberg and Cracow, and "nostro" accounts opened with the largest banks in the republic. Polish marks being the official currency adopted by the country, trading in them is based upon the German mark rate and the "exchange" is quoted a trifle under that of German marks.

As the exchanges of the Allied powers depreciated in value in this country, the Polish mark, like all of the exchanges of the newly created countries of Europe and also the old Balkan states, naturally decreased in value in the United States, until today they are quoted nominally at 12 cents per 100 Polish marks.

Under the present arrangements that could be made, banks in this country were in a position to act as agents for their customers in the transfer of Polish marks to residents of Poland at the rate given at the time the transfer was requested.

Drafts were also drawn on these correspondents in the principal cities of Poland, payable in Polish marks.

If political and internal conditions had been as favorable throughout Poland as in the majority of the other countries of Europe, the Polish banks could probably have improved the service they have given the American banks, but this handicap, coupled with the shortage of competent clerical help, necessarily made the service so uncertain that the majority of banks in this country found it impractical to continue their efforts to effect remittances or to protect drafts.

Realizing the stress laid upon the necessity of transmitting funds to Poland at the earliest possible date, the larger banks in New York have been working on plans most practical in solving the problem, and it is as a result of these efforts that the two New York institutions are announcing the arrangement whereby funds can be transferred to Poland under the official supervision and guarantee of the Polish government.

According to the announcement, the Guaranty Trust Company of New York will now act as an agent for the Polish government, the arrangement entered into being for the purpose of supplementing the existing facilities for forwarding remittances.

As soon as practical arrangements have been completed, these remittances will be made on official Polish government forms.

In the event of non-delivery, due to various causes that might be given, it is planned to make refund to the sender of the funds of the full amount of dollars remitted, less a nominal fee to cover the cost to which the bank or its correspondent has been put in acting as an agent for the customer.

The dollars received by the Guaranty Trust Company of New York to "cover" remittances to Poland will be held in a special account until advices have reached this side that the payments have been effected, when such "cover" will be put at the disposal of the Polish government by the trust company.

It is also reported that the Minister of Finance of Poland will in the near future issue rules and regulations covering the delivery and receipt in that Republic of remittances from the United States.

Should the arrangement be completed whereby dollars can be transferred to Poland through the Polish government, commerce between these countries will necessarily benefit to the extent that through the creation of dollar balances here, a good portion will be utilized in the purchase of American goods, the new arrangement thereby proving of advantage to American manufacturers and exporters.

In the case of the National Bank of Commerce in New York, drafts will be issued in pounds sterling or United States dollars upon the banks established abroad, which drafts will be "payable at the bankers' buying rate for demand drafts on London" or "New York."

Milling Machines--When and How

Classes of Work on Which Their Use Is advantageous; A Discussion of the Several Types, and How Employed

By ALBERT A. DOWD*

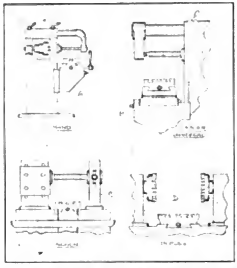

Fig. 1—Diagrams of Hand, Universal, Lincoln and Duplex Milling Machines.

WHY should I buy a milling machine for my work?"

"What type of machine do I need and how will the use of a suitable machine increase my production?"

These are pertinent questions which every executive will be asking very soon. In point of fact many wide-awake men are considering these matters right now, not only with respect to milling machines but to other types of machine tools as well, in order that production will not be held up when business stabilizes itself once more.

This article is written for the purpose of showing the busy executive, briefly, first how he can buy machine tools both wisely and well; and second, how he can obtain better production from the machines he is now using. The works manager or superintendent of a large factory and the foreman of a small shop both may find it profitable to look over the facts presented here and consider them carefully before getting ready for production.

Necessity For the Machine

It is essential for the executive to know just why his foreman tells him he needs a milling machine for a given piece of work. If he does not know the why and wherefore, he must be dependent upon his foreman for the information needed. Now a foreman may be and usually is a capable man, yet he does not know what plans may be ripening for future production, changes in design or possibly even a contemplated change in the character of the product to be manufactured.

The executive DOES know these things and therefore, if he has sufficient knowledge of machine usages to determine the type of machine best suited and most adaptable to his work for both present and future, he can judge and decide upon machine merits himself.

Let us assume that a factory is manufacturing a certain mechanism such as a pump, a gasoline motor, a motion picture machine or some other product requiring a great number of machining operations of various kinds. How then can an executive determine whether he requires a milling machine or not when his foreman recommends its purchase? Obviously the executive must know how a milling machine is used and what advantages, if any, it has over other types of machines for the operations to which he wishes to apply it.

The foreman says he wants a No. 2 plain milling machine for a certain job. Why can't he do the work on a planer or a shaper or a surface grinder? The factory has plenty of these machines. Why must a new machine be bought? The foreman knows that a milling machine with suitable fixtures will produce the work economically and rapidly and therefore he recommends the purchase. He knows the work is comparatively small and that it can be produced faster on a milling machine than in any other way. But the executive does not know this because he is more or less unfamiliar with machine tools. Let us see if we can make the matter clear by a few brief statements as to the kind of work adapted to milling operations.

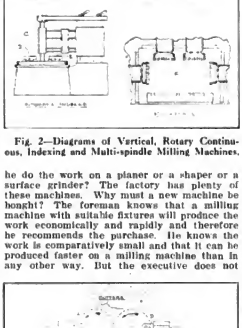

Fig. 2—Diagrams of Vertical, Rotary Continuous, Indexing and Multi-spindle Milling Machines.

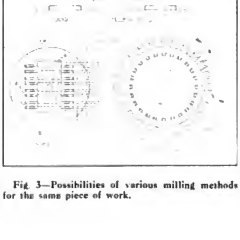

Fig. 3—Possibilities of various milling methods for the same piece of work.

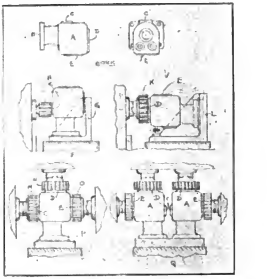

Fig. 4—Increasing production by utilizing the proper machine for the work.

Almost any kind of a casting having bosses, pads, short surfaces or slots to be finished can be profitably machined on some type of milling machine by using suitable fixtures. For very long plain surfaces, angular ways like those on the bed of an engine lathe or other machine tool, and for other work of this general character, a planer is more suitable than a milling machine but it is much slower in action.

Slides of various kinds, dovetail, square and taper, which require scraping for the final fitting, are usually machined on a planer not only for the reasons mentioned but also because a planer surface consisting of a series of parallel grooves can be scraped to a finish much more easily than if the same surface had been milled.

There is no intention in the foregoing discussion to compare milling machines and planers except to show in a general way the class of work to which each machine is particularly adapted. Both machines have their own fields and both are valuable producers.

Type of Machine Needed

Now let us see if we have arrived at a sufficiently clear understanding of the uses of planers and milling machines to decide whether the work to be done is better adapted to one machine than the other. The work for which the foreman says he wants a milling machine is a transmission gear case about 12"x15"x10". It has several finished bosses and pads on three sides of it and it is open at the top with a finished flange all around the opening. Now then, based on the description of the class of work which has been mentioned as distinctly suited to a milling machine, we would be inclined to agree with the foreman's judgment and say definitely that we need a milling machine for the work in question.

We have reached a point now where we have definitely decided that we need a milling ma-

*Albert A. Dowd, who has written this article especially for the Michigan Manufacturer and Financial Record, is president and general manager of the Albert A. Dowd Engineering Company, New York. Frank W. Curtis, chief engineer of the concern, has collaborated.

Digitized by Google

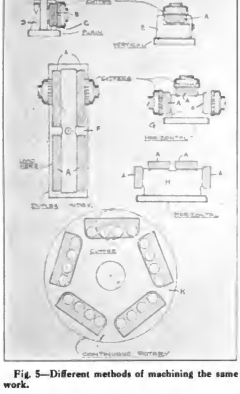

Fig. 5—Different methods of machining the same work.

chine, but we do not know what type of machine is most suitable for our work. Let us then forget the transmission case and the foreman and take up the various types of milling machines and see just why they are adapted and used for various kinds of work.

Practically all types of milling machines are built in several sizes and with various modifications or improvements governed by the manufactnrer whose prodncts they are. Each type of machine is, however, more or less distinct in its functions and purposes, although it may be somewhat different in general design.

Fig. 1 shows several diagramatic representations of hand, plain and universal, Lincoln and dnplex types of milling machines. The hand machine "A" usually is driven by an open belt and has no back gearing, nor has it power feed to the table. In some designs the head carrying the arbor and cutters moves up and down and the table is fed backward and forward by means of a hand lever. In other designs the head remains stationary while the table is fed hackward and forward or up and down by a hand lever. Hand milling machines are used principally for light facing, slotting, forming or straddle milling cuts—short in length —and on materials which can be cut at comparatively high speed, such as brass, aluminum, malleable iron, soft steel and the like.

The plain and universal machines shown at "B" are not exactly the same but are similar in general construction. The difference between them is principally in the table, which can be swiveled in the universal machine, while on the plain type it moves only in a plane at right angles to the spindle. Machines of the universal type are for the most part used in the tool room and not generally for manufacturing purposes. The plain machines are made in a number of sizes, the lighter varieties being driven in some cases by an open belt without back gearing, but in the heavier types the gearing is powerful and feeds in all directions are provided for the table. Machines of this type are used for medium and heavy cutting of cast-iron and steel. Straddle milling, surfacing, form and gang milling operations can all be done on these machines.

The Lincoln type milling machine shown at "C" has a vertical adjustment to the head but none to the table. It is back geared and suitable for medium heavy forming cuts, straddle and slot milling and surfacing. Machines of this kind are much nsed in general manufacturing of medium sized and small mechanisms.

The duplex milling machine shown at "D" is made in several sizes, the lighter designs being driven by an open belt while the heavier types are back geared. Spindles can be adjusted horizontally and vertically. For facing opposite sides of casting or forgings and for cutting shoulders or slots these machines are particularly adapted.

Fig. 2 shows diagrams of vertical, rotary, continuous, automatic indexing and multi-spindle milling machines. The vertical type "A" is belt-driven on the smaller sizes and back geared on the larger. Usually the spindle and table are both adjustable. Suitable feeds are provided for the latter. Machines of this kind are much used for light and medium facing and surfacing work, also for shoulder work of certain kinds. Spindle speeds are such as to permit rapid cutting of aluminum and brass. The rotary continuous type "B" is similar to type "A" except that it has a revolving table on which work can be set up so that continuous cutting is achieved as the table rotates.

The automatic indexing type "C" consists of a heavy bed with an adjustable spindle carrying head and an indexing table on which two sliding tables "D" and "E" are mounted in

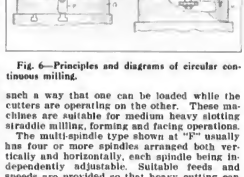

Fig. 6—Principles and diagrams of circular continuous milling.

such a way that one can be loaded while the cutters are operating on the other. These machines are suitable for medium heavy slotting straddle milling, forming and facing operations.

The multi-spindle type shown at "F" usually has four or more spindles arranged both vertically and horizontally, each spindle being independently adjustable. Suitable feeds and speeds are provided so that heavy cutting can be done economically. These machines are particularly adapted to facing operations on large castings, and it is customary to set up a number of pieces of work on the long table so that pieces are milled successively.

Points Affecting Selection of Machines

A general idea has now been given of the purposes to which the various types of milling machines are most suited; yet it will be seen that certain classes of work can be machined on several of the types shown. For this reason the manufacturer should select his machines with a view to their adaptability.

If the product which is being manufactured is subject to a change in design or if it is likely to become obsolete in a short time, care should be taken to select a machine which can be adapted for other purposes.

Let us consider the various factors which have an effect on the selection of a milling machine.

1. Production required. If the machine will be required continuously on the same product and if the product is not likely to be materially changed in design, the selection can be made to suit the particular work on this piece. If, however, a comparatively small production is needed a machine should be selected which can be readily adapted to other work.

2. Size of work and character of cuts to be made, whether light or heavy. In considering this aspect of the situation the power and capacity of the machine should be such as to give the greatest possible production.

3. Material to be cut. Cast-iron, steel, aluminum and bronze are cut at different rates of speed and feed. Steel and cast-iron require more power and less speed than aluminum and bronze.

4. Accuracy required. This may be an important factor, as a comparatively cheap machine may be all right for rough work, while a more expensive and better made machine would be required for work requiring great accuracy.

5. Cost of machine. If the amount of time saved by the use of a milling machine is not sufficient to pay a good premium on the investment, it would not be wise to buy it.

6. Cost of tool equipment. A milling machine in itself is not sufficient for production work unless the tool equipment is suitable. If the machine is intended for toolroom work the equipment should be purchased in accordance with these requirements. If, however, the machine is to be used for production purposes it usually is necessary to design fixtures in order to hold the work properly. The importance of suitable fixtures cannot be overestimated, as the production can be increased materially by the use of well designed fixtures and correct methods of handling.

A number of points in connection with the design and use of milling fixtures will be brought out in this article and the importance of proper planning an efficient design will be made apparent.

The method used in handling any piece of work depends to a considerable extent on the production required. It is possible to mill a certain surface or slot in a number of different ways, but the efficiency of one method may be far greater than another. Probably the best way to illustrate this point is by means of diagrams, and therefore we will mention a few cases which show clearly the advantages of a proper selection of machines with suitable tooling in order to obtain maximum production.

Fig. 3 shows at "A" a piece of work which is to be straddle milled and slotted. Probably the simplest way to do this work would be by holding it in a fixture similar to that shown at "B" and machining the pieces one at a time

Welfare Work by a Third Party

Hal a Hundred Michigan Manufacturers Adopt Unique Plan to Show Interest-Plus in Employes

HOW THE DODGE MANUFACTURING COMPANY GOT ITS EMPLOYES TO "TELL WHY"

PERHAPS the most difficult problem The man in charge of personnel work has to coniend with, is to get a definite, worth-while expression from the employe of just what he thinks of the various forms of welfare work and of the organization that employs him. This was the situation Dr. W. A. Moore, manager of industrial relations for the Dodge Manufacturing Company, Mishawaka, Ind., ran up against.

There were six questions which puzzled Dr. Moore and which might well be asked in every organization, whether or not that organization is of sufficient size to warrant the employment of a highly trained personnel man.

They were: What is the Dodge spirit? Why do so many stay so long with Dodge? How can we get old Dodge spirit into new men? How does an old Dodge man feel about the company? What are the impressions of a new man? How can we attract and hold the kind of a man who will stick?

At last the idea came to carry out a prize contest in the Dodge News, the weekly internal house organ. The rules governing were made just as fair as possible. Any employe was eligible; one subject could be selected and the answer was not to contain in excess of 1,000 words. No names were to be signed to any paper, but the name, department and

THE WINNER

clock number of each contestant was to be written on a separate sheet of paper, enclosed in an envelope and attached to the entry. Three prizes were offered: $25, $10 and $5. The judges were selected from among the factory executives.

When the judges' decisions were compared it was found that the first prize was awarded to a worker in the steel shop who had chosen to give the impressions of a new Dodge man. This man had been a "boomer" and an industrial drifter all his life but had decided that he liked the organization so well that he was going to stick. To say that the ideas he advanced were valuable to the manager of industrial relations is to put the matter mildly. For example, this man liked the commissary, where the company sells groceries and clothing to employes at cost; he enjoyed the benefits of the Relief Association; he had saved money through the thrift club; he had particularly enjoyed the advantages of the employes' club, the cafeteria and the Dodge News. He was especially grateful for the treatment accorded him by his superiors and of the general spirit of good-fellowship and co-operation between all units of the organization.

The company is now running in its internal house organ the papers of the winners and of those who obtained honorable mention.

The company believes the contest idea is well worth the time and money spent. The number of entries were large and answers came from its branches from Seattle, Wash., to New York City. Incidentally, it developed a number of new ideas which eventually will bring changes in the welfare and personnel work.

FAITH in human nature has been known to be upset by so small a thing as a plug in a gasoline tank, and, as strangely, restored by such a thing as a pair of work horses. Withal, some faith persists, which explains why some industrial executives adopt and swear by plant welfare schemes. Others for reasons good and sufficient, do not. They have their employes' well being just as much at heart, but they are wary of anything that smacks of paternalism.

Human nature in industry is constantly tipping backward and forward the faith in the ultimate good intentions of the majority of the wage-workers, which the executive office strives to retain in the face of many discouragements. Take the case of a prominent Michigan manufacturer, to whom the virtues of plant welfare work were being presented.

"Welfare! I wouldn't give my employes the satisfaction of spending money on welfare work," he said. "They wouldn't appreciate it in the first place, and in the second place I haven't any faith in their loyalty to my interests. Here is one reason: The other night I started home in my car. Going up a hill the car balked. I searched for the cause without success, but finally got the car started again. After dinner that evening I took the machine out, but before I had gone very far it stopped again. Finally I had to have it towed to a garage. There a mechanic discovered a wooden plug in the tank. The plug had been whittled down to a nicety by some worker in my plant who knew what would happen.

"Do you think I am in a frame of mind to do a little something extra for employes who will treat me like that? That plug represents largely the attitude of workers toward their employers. Yes, I've lost faith in human nature. It is 'dog eat dog' and we might as well recognize it."

On the other hand, here is a little story about an employer and a pair of horses. This man was a gentleman farmer, by which is meant that he farmed for the love of it when not directing the activities of a great manufacturing plant. He resisted overtures on welfare work, on the ground that its principles were founded upon sentimentality and its results on production negligible. This man had a pair of work horses on his farm of which he was justly proud. In his spare time he often rode behind those animals in the fields.

On one occasion he found his horses lily prepared for the day's work. They were drooping, restless, uncleaned and altogether a pitiful contrast to their usual sleek, spirited selves. Investigation showed that they had not been properly groomed, if groomed at all; they had not been half fed and their stalls had not been bedded down, all due to neglect by the caretaker.

They could have been driven to work by the whip, but that was not this man's way. He was upset by this neglect of his good animals. He saw both the inhuman and the uneconomic phases of the neglect. Introspection drove his mind back to his plant and a comparison was built up from which came this realization: If a man owes something to his dumb beasts who work for him without choice, certainly his human fellow who work for him by choice are entitled to something more than a place at a machine and a daily wage. The majority deserves it, even though there is an undeserving minority. This man was sold on basic principles in the improvement of working and living conditions.

This article does not set out to argue for or against so-called welfare work. It is recognized that following this depression the need of and the desire for employment will place the privilege of work and the pay envelope above all other considerations. But many employers nevertheless will continue their various recreational, welfare or good will methods, with perhaps some restrictions on past policies. With the resumption of industry some employers will for the first time attempt to introduce some facilities or plans for expressing their interest in their workers over and above the recognition given in the pay check. They will endeavor to reduce working forces to a minimum and at the same time gain a greater production and lessen the turnover cost as applied to labor. There are many ways of working toward this end, all of which have been given no end of prominence. In this article, however, there is presented a new and unique method of supply-

To avoid the appearance of "publicity," the editors have omitted the name of the company supplying the service described in this article. Readers who may be interested, however, in ascertaining its identity will be informed by letter if they will communicate with the Editorial Department.

Digitized by Google

ing a good will service to the employer, which owes its existence to the fact that many smaller manufacturing plants in Michigan did not feel able to provide extensive facilities of their own.

In the effort to supply a substitute for the contact between employer and employe possible in the days of the guilds and the master and his journeymen, many plants have installed costly systems. In many cases these have been tainted with condescension or tinged with a charity either resented or unappreciated. The systems have been always a part of the plant machinery. Neither the desired object nor the whole-hearted loyalty of the workers have been accomplished in every case, nor to the degree desired in any case.

It was the opinion of a Michigan man who had given the subject some study that most of these systems failed in accomplishing the desired results because of the lack of a third and independent party; and furthermore, that plant welfare was as important in the small factories as in the larger ones. It occurred to him that there was a large field for an indirect contact service to employer and employe, which would benefit where compensation left off and proceed through the whole gamut of employer-employe relationship as far as necessary or acceptable; a service providing the best element in all known welfare plans at a cost as low, or lower than any employer could instal his own method.

This man saw a certain value in such a service organization, a value derived from the freedom to give the same amount of unbiased consideration to the problems of the employe as to those of the employer, which would result from the more or less disinterested position of the third party, even though the pay check came from the employer.

The success of such a service as this man has established in more than 50 plants in the state was and still is dependent upon satisfying the employe that they were in no better off in the plants which show a consideration of their needs by using the service, to accomplish which the agency must win and hold their confidence. This confidence maintained reacts in like manner upon the employers using the service, who report increased production, lower turnover, better quality of work and other advantages.

The Program Formulated

It was 18 months ago that this man put his ideas to the acid test by organizing in a populous Michigan industrial center a corporation to supply such a service. At that time labor turnover was a problem of large dimensions. Also the mouthings of the agitators were spreading discontent. High wages were turning heads and the inspiring watchfulness in hours and money. This man organized a working staff consisting of doctors, trained nurses, lawyers and salesmen and prepared a platform embodying these principles:

That labor is entitled to fair consideration in the conduct of industry.

That labor is entitled to something more at the hands of capital than wages.

That industry should safeguard the health of labor.

That both employer and employe are entitled to a fair understanding at all times with each other.

That industry should meet its costs and that a part of these costs is a contribution to the expense incurred from the breaking down in the health of the wage-earner. At the same time such expense will be more than offsetted by the increased production obtained thereby.

That the employer is entitled to receive a dollar's worth of work for each dollar paid in wages.

That every employer should display in a substantial manner a personal interest in his employes by establishing a relationship of consideration and understanding.

The man sold the manufacturers on a guarantee that he could tell them what was the matter with their employes if they were burdened with excessive turnover, low production or troubles due to general or group discontent. He agreed that, after discovering the causes of any of the foregoing conditions, he would eradicate or minimize them if the employers would grant him reasonable co-operation.

The hypothesis upon which he operated was that the employe rarely expressed his real sentiments in his place of employment, except in a guarded and more or less underhand manner, the reason being his fear of losing employment or incurring the enmity of those superiors with whom he came in closest contact; also that such complaints or sentiments as gained circulation often were colored or misrepresented by the time they reached the ears of the employers.

In the home, however, he felt sure the real mental attitude of the employe would be expressed because there he was at his home and that the service was expected to do its most effective work.

Two methods of application of this service and two rates are offered the employer. Rate No. 1 is based upon weekly benefits to the amount of 50 per cent of the insured's weekly wage, these benefits increasing or decreasing with the policy holders wages, the minimum cost being two per cent of the wages. This rate is subject to increase based upon the experience had in the factory or shop, due to the nature of the individual business. Under this rate the employer pays the entire cost.

The second rate is based upon fixed weekly benefits upon which the minimum benefits for all men of all occupations, and also for women in offices and stores, is $10, and for women in shops and factories $8. The minimum cost upon such policies is 40 cents a week, which cost is paid by the employer. If additional indemnity is desired it may be had by the payment of 4 per cent of such increases. This extra cost may be paid by either the employer or the employe, but in any event must be included in the payment to the service of the regular cost. No contracts are made.

How It Works Out

From the time the service is subscribed for by the employer, the work of the organization is concentrated upon the employes to whom direct benefits accrue, while the benefits to the employer are indirect.

Each morning the factory or shop provides the service with a list of all absentees. This is turned over to the head nurse, who has divided the city into districts, with physicians and nurses subject to call in each. The home of the absent employe is then visited, who "lay" is merely ascertains the cause of the absence. There is no interference with the home life, no attempt to dictate and no rendering of help unless desired.

If, for instance, the nurse finds that the employe remained away from work to go hunting, she merely asks when he expects to return to work. If he considers a report to the effect that the employe has taken the day off and will return to work later. On the other hand, should the nurse find the employe ill she refers a doctor's service and gives such nursing attention as may be required. The employer is notified of the employe's illness, and if it is prolonged, benefits of one-half of his wages, based on the eight day and continue through the illness.

In the meantime the nurse makes daily visits to the home and endeavors to establish a friendly sympathetic relationships with the wife and other members of the family. As important, perhaps, as medicine or nursing is the confidence which the nurse strives to create by impressing the employe with the fact that she represents a third party in whom he may confide without the feeling that whatever he may say will be carried back to the employer.

Should the nurse find that an employe has met with an accident, his benefits begin immediately. Where it is found that a child or some other member of the family is ill and the employe has remained at home on that account, the nurse offers to take charge, thus enabling the worker to return to the factory. As the service means no expense to him, the employe can do better work because his mind is at ease.

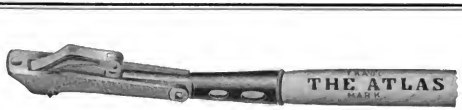
Temporary "crouches" make periodic absences of many men who otherwise are good employes. These negative mental attitudes arise from many causes. Perhaps the foreman has been critical or abusive. Maybe a machine is not working right, or the room in which the man works is too hot or too cold. The employe may be the victim of some idle agitator's eloquence and knows of no other way to express his sense of injustice than by staying home.

Now if the service merely contented itself with repeating the employe's expressions of dissatisfaction to the employer, its value to either the employe or the employer would soon be discounted. That is not the policy. Instead, a representative is sent to the shop or factory to ascertain how much of the employe's dissatisfaction is justified before any report is rendered the employer. In every case the confidence in the employe is respected where evidence of his attitude would accomplish no special good.

Unreasonably low wages and improper working conditions may cause discontent. When the service representatives have established to their satisfaction that either one of these conditions, or both of them are responsible for the employer's inattentive habits, he is urged to make some concessions, either in the improvement of working conditions or by increasing wages.

Bulletins Help

Immediately after an employer has subscribed to the industrial service, the employes are informed of the fact by a circular explaining just what the service is and why the employer has made it available. From that time on the employe receives monthly bulletins of an educational and entertaining character. These explain many of the problems confronting the employer.



This bulletin service takes the place of the shop paper or house organ published by most of the larger plants. It is written in simple language. From its pages a typical workman character named "Bill" speaks to his fellows in a practical, understandable manner. He discusses working conditions, praises or criticizes according to the demands of the occasion; speaks a few "plain words" to the slow and endeavors to talk pointedly on all current events as they affect the factories in which his fellow workers are employed. These points and such changes as may be made in them are discussed at length, so that the employes know why certain changes are made and what the "big boss" is trying to do for his working partners.

As might be expected, occasionally employes try to impose upon the service. One man, for instance, was confined to his home by illness. Instead of returning to work when able, he decided to take it easy for a few days. He sent in a doctor's certificate to that effect. As a result his disability allowance was cut. He resented it and on returning to work informed his fellow workmen that he had been cheated. They urged the head of the service to insist. So he suggested that the employe submit his case to a group of his fellow employes. At the hearing each side gave its version and in the end the jury decided against the employe. Had the jury decided for the employe the service would have accepted the decision and taken its loss, for it would have felt that, "I would rather lose a case and money as well than lose the confidence of the men we serve, unless of course there is sufficient evidence to show a frame-up."

The company will sell a mutual service, paid for by the employer and employe, but not without reluctance. The founder's experience leads him to believe that such arrangements seldom succeed, and he does not believe the efficient worker should be taxed to support the inefficient, or the strong made to indemnify the weak. Where the employe pays a small fee in co-partnership with his employer there always is the possibility of unreasonable demands.

The mutual system was tried once and it lasted three weeks. An employe who disliked the service physician demanded one of his own selection; another employe demanded two doctors and a third started a campaign of abuse against the service because he was not permitted to have a nurse on full time during a short and not at all serious illness.

Do Your Own Switching

THE above cut shows the powerful compound action of the famous Atlas Car Mover.

To be independent of switching crews, to be able to place a loaded car no matter how heavy, to get it out of the way when unloaded—without trouble, without extra expense, is worth many times the cost of one of these Movers, yet this is the service rendered by an Atlas Car Mover in the hands of one man.

Signs of Automotive Revival Multiply

By MARC BRAUN

WHILE in Portland, Ore., a few days ago, Robert J. Schmunk, general sales manager of the Peerless Motor Car Company, Cleveland, expressed himself as follows on the general situation, says the Sunday Oregonian:

"Business has really picked up wonderfully in the East during the last 30 days. The factories already have been given impetus, and, speaking from our standpoint, we have received encouraging orders from practically every section.

"Manufacturers of medium-priced and higher-priced cars throughout the Middle West are assuming an attitude of careful and conservative production and this may result in a shortage of cars during the peak season of the spring. Many of the factories, like the Peerless, are planning a program of 50 per cent of maximum production for the coming year and unless demand proves far beyond expectation this will not be exceeded."

Mr. Schmunk is quoted as saying that no reduction in prices of motor cars is possible for many months.

In a letter to its distributors the Oakland Motor Car Company, Pontiac, says in part: "The last year has been as a kaleidoscope, for we have journeyed within a period of 12 months from conditions which were tremendously abnormal to a sales period which was distinctly subnormal, and we have now come to an era of prosperity which convinces us that normal times are returning. The fluctuation of the retail market has been quite as severe on the manufacturer as it has been unfavorable to the interests of the dealer.

"With the opening of the New York show we heard a few suggestions of price increase and no discussion of price reduction. The price sentiment, as expressed in New York, has been materially strengthened in Chicago, where we have had frequently brought to our attention suggestions of early price raises on some cars.

"Though we have given a positive guarantee against any price reduction, we do not give any guarantee against a possible increase. We do not say that the price of Oakland cars will be raised, but there are far more chances of price increase than a price reduction, and there are many reasons why an upward revision of retail prices is justified."

The first of a number of trainload shipments of Oldsmobile cars for J. W. Leavitt & Company, San Francisco, left the Olds Motor Works, at Lansing, the latter part of February. The train was made up of 62 cars and contained 248 Oldsmobiles. The Leavitt concern is said to have place orders for $5,000,000 worth of cars.

The Dashiell Motor Company, Chicago, distributor for Dodge, is quoted in the Chicago Evening Post as having said that its business for the period of November to the end of February was the best in the company's history and that February sales of commercial vehicles were five times as great as during February, 1920.

Information coming from the H. H. Franklin Manufacturing Company, Syracuse, N. Y., is that during February 1,107 orders for cars were received and that production totaled 952 automobiles. For March the production schedule was 1,031 cars, and, according to the Chicago Franklin dealer, 65 per cent of this output had been sold some time ago.

Fort the third time the Overland-Harper Company, Philadelphia, tops the sales list of Overland branches for the year. The final compilations for 1920 have been announced by the Toledo concern. In speaking of the general situation, President H. B. Harper, of the Philadelphia corporation, says: "January was the best month we had since August; February was 40 per cent better than January, and the next three months will show considerable gains from month to month."

"Business has been coming back nicely of late and we expect to continue to add men and increase our output," said an official of the Columbia Motors Company, Detroit. "It will not be long until we shall be up to 50 per cent of normal if business keeps on coming in as it has during the last few weeks. The comeback started after the New York automobile show, as we had expected. It has been improving ever since. Conditions are especially improved in the East and in the Chicago territory."

There is as yet no indication as to when the plant of Dodge Brothers will resume activities. It was, however, not denied by an official that men were likely to be called back from now on in small numbers. Business has not picked up as much as the public has been made to believe and it would be a deception, the official added, to reopen the factory now with a flourish. Some of the Dodge dealers have

Business Bills Piling Up

The Flood Continues at Lansing, With Taxation One of the Chief Issues; New Utility Measures

[By Staff Correspondent]

LANSING, March 14.—In the midst of investigations and probes and scandals and charges and proposed laws of all kinds and styles, there continue to pour into the state legislature bills affecting business, utilities, automobiles, highways, finance and commerce.

Hoping further to protect automobile owners, Senator George M. Condon has introduced a bill to provide for the issuance of certificates of title and to regulate the sales and purchase of used cars or transfers thereof. This plan to stop thievery and assist in recovery of stolen cars has been advocated by the Detroit Automobile Club and other similar organizations. Dealers in used cars would be licensed and a state detective system would be devised to assist owners to recover their stolen machines. The cost of the certificate to owners would be $1 and the papers would not have to be renewed until the car was disposed of. After July 1, 1922, the Department of State would be empowered to refuse to sell a license unless a certificate of ownership were either shown or purchased. Full information on each car would be recorded. Anyone who sold a car after October 1, 1921, without following the provisions set forth, would be liable to a fine of $1,000 or 10 years in prison. In case a statement is forged when obtaining a certificate or transfer is made when the party purchasing the machine knows it has been stolen, a fine of $5,000 or 10 years in prison is provided. Sheriffs and chiefs of police would be obliged to report stolen and recovered cars to the state department.

Further progress was made in the reorganization of the state government. The bill to create a department of conservation has been passed by the House. This would combine half a dozen departments and save $100,000 a year in salaries. The agriculture bill has also been passed by the House.

The tax question is one of the big issues before the legislature and many schemes to raise more money are being proposed, including a state income tax. Another plan considered by Gov. Groesbeck is to increase the inheritance taxes and levies on insurance companies. The inheritance tax would be taken from the primary school fund and diverted to the sinking fund with which to pay the highway bonds. The tax on insurance companies, which also goes to the primary fund, would be increased sufficiently to make up for the loss of the inheritance tax. Last year the inheritance tax was $780,000, and this would be increased to a total of $2,000,000. It is also proposed to provide an annual franchise tax on all corporations, domestic and foreign, operating in Michigan.

The proposed state income tax system as provided for in the bill of Rep. Frank B. Mosier was strongly opposed by a delegation of 100 manufacturers last week, Hal H. Smith, counsel for the Michigan Manufacturers' Association, declaring that the tax was not fair, that it levied its toll on brains and ingenuity, and that there should be more co-operation now between manufacturer and farmer. Hiram W. Savage, president of the Saginaw Valley Manufacturers' Association, also opposed the income tax and rather favored a gross sales tax. Orlando Barnes, member of the state tax commission, said he believes the income tax was "here to stay."

The Watson-Olnstead bill, which gives state banks will less than $150,000 capital and surplus, the privilege of acting as administrators and guardians of estates, has been passed by the House. An amendment gives trust companies the right to engage in savings and commercial bank business.

Representatives of railroad lines protested before the Senate committee on railroads against the passage of Rep. Andrew B. Glaspie's resolution asking Congress to repeal the act which takes from the states control over intra-state rates.

Absolute power and control over all privately owned public utilities would be conferred upon the Michigan Public Utilities commission by a bill introduced in the house by Rep. Lemuel G. Dafoe, of Alpena. Street and interurban railways, water, electric light, gas and telephone utilities would be included, and the Commission would have full control of rates and service. The cost of appraisals would be paid by the concerns, the money to go into a commission fund. The five members of the Commission would be appointed for four years at an annual salary of $8,000. The Commission would have access to all books and could require annual reports. The bill would prevent discrimination by utilities against any individual or firm. A bill by Rep. W. F. Miller, Houghton, would prohibit discrimination in fixing rates by power utilities, and no electric utility could fix or change rates until ordered by the utilities commission.

Further labor bills have been offered by Rep. Walter A. Henze, of Dickinson. Among these is a bill which would require any corporation in which beneficiary fund is maintained by employes, to pay out of this fund any fees contracted by an employe from a physician or doctor other than the regular medical aid offered by the corporation.

As the banks informed the administrative board they could not take up the $5,000,000 highway bonds at 5 per cent interest, the fate of Michigan's road building program is up to the legislature.

WOOD LAUNCHES OWN FIRM

Albert Wood who designed and supervised construction of the Henry Ford hospital, Detroit, and who has been president and chief of construction of the Dearborn Realty & Construction Company, has organized the firm of Albert Wood, engineer and architect, with offices in Dearborn. Mr. Wood is a member of the American Institute of Architects.

WADSWORTH'S NEW CONNECTION

Albert W. Wadsworth, for the last five years manager of the Grinnell Realty Company, Detroit, has become associated with the Webster-Oliver-Streeter Company in the same capacity and will have charge of the Detroit office. Mr. Wadsworth is an active member of the Detroit Real Estate Board. He was engaged in the abstract and mortgage loan business for a number of years in Rock Island, Ill., Pittsburgh, and Cincinnati, previous to locating in Detroit.

The Webster-Oliver-Streeter Company, has opened a branch office in Royal Oak, with B. J. Williams, formerly manager of the North End Realty Company, in charge.

ADDING EMPLOYES AT BRONSON

Two concerns in Bronson are putting on more employes, having received substantial orders. The concerns are the Visel-Darling Company and the Douglass-Rudd Company.

Grand Rapids to Hold Office Appliance Show

The Grand Rapids Office Appliance Show has been promoted by the Grand Rapids Business Show Association and will be held April 7 to 9 inclusive, in the Klingman building.

This will be the first show of its kind in Michigan, and, judged by the preliminary list of exhibitors, it will be an event of considerable importance. Similar shows have been held in some of the larger cities of the country and resulted not merely in a large attendance but were the means of obtaining much business by the concerns taking part. It would not be surprising if after the Grand Rapids show similar ones will be held in other Michigan cities, according to office appliance dealers.

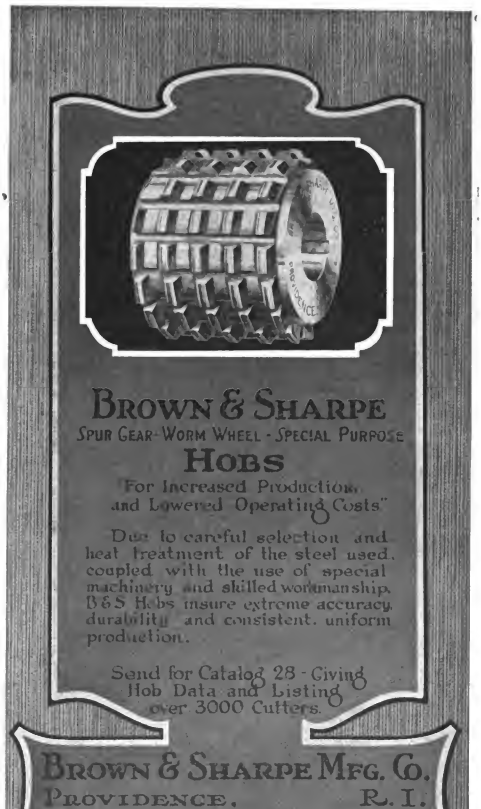
The partial list of exhibitors just announced consists of the following: Fox Typewriter Company; Prondfit Loose Leaf; Metal Furniture Company; Macey Company; Underwood Typewriter Company; National Cash Register Company; Burroughs Adding Machine Company; Kalamazoo Loose Leaf Binder Company; Michigan Litho; Whits Printing; McLaughin Business College; B. D. Coats, form letters; International Time Recording; Metzgar Register; Todd Protectograph; L. C. Smith & Brothers; Standard Register Company; Zimmer Brothers; Toledo Scale; Taylor Typewriter Store, Corona, Woodstock and Neostyle; Tisch-Hine Company, Ediphone, Mimeographs, Gunn desks and office snpplies; Bixby Office Supply Company; Comptometer; Addressograph Company; Serfing Company; Victor Adding Machine Company; Multigraph Sales Company; Remington Typewriter; Challenge Machinery Company; Klingman Furniture Company; Monroe Calculating Machine Company; Sundstrand Adding Machine Company; Tabulating Machine Company; City Trust & Savings Bank; Dictaphone Company.

The Grand Rapids Business Show Association was formed in February especially for the purpose of organizing the office appliance show. The officers are: W. F. Hentschel, president, division manager for the American Multigraph Company; W. H. Kessler, vice-president, vice-president and sales manager of the Tisch-Hine Company; Lee M. Dygert, secretary, district manager for the Addressograph Company; A. F. Marks, treasurer, district manager for the Burroughs Adding Machine Company.

AETNA RUBBER AT CAPACITY

The Aetna Rubber Company, Cleveland, which makes hard rubber parts for batteries, plumbers' force cups and various articles in which hard and soft rubber is used, as well as rubber gloves used by electricians and linemen, is working two 12-hour shifts and is reported to have business on its books which will keep it in full operation for a long time. The concern is not making any rubber articles for the automotive industry, it is said.

McGREW JOINS MASON & CO.



C. B. McGrew, Jr., architect, who was associated with Smith, Hinchman & Grylls for some three years, has severed his connection with the latter and has joined the forces of George D. Mason & Company, 508 Griswold street, Detroit, where he is working on plans for the new 13-story Shrine Club.

STEERE ON 70% BASIS

The Steere Engineering Company is operating its Owosso plant on a 70 per cent basis. Orders sufficient to keep the works busy for two months have been received during the last ten days.

CONSTANTINE MILL RESUMES

Operations have been resumed at the mill of the Constantine Board & Paper Company, at Constantine. The plant had been idle since about February 1.

NEW ROLLS-ROYCE PERSONNEL

S. deB. Keim, general sales manager, American Works, Rolls-Royce, Springfield, Mass., reports the following changes in sales personnel:

R. W. Schuette, for many years Rolls Royce distributor for the United States, and of late, New York branch manager, has resigned with the object of taking an extended trip through Europe, to be gone several months.

J. S. Inskip, formerly of the sales department of the New York branch of the Locomobile Company, has been appointed New York manager, succeeding Mr. Schuette.

Richard Travers, for the last seven years Pierce-Arrow salesman in Chicago, has joined the Chicago branch of Rolls-Royce.

J. Roy Hiltz, for a number of years with the Locomobile, and recently with Hare's Motors of New England, has resigned and accepted a position on special sales work, making his headquarters at the American Works, Springfield.

C. R. WILSON BODY DIVIDEND

The directors of the C. R. Wilson Body Company, Detroit, have authorized payment on April 1 of the regular quarterly dividend of 1¾ per cent upon the outstanding preferred stock to stockholders of record March 21.

SHERIDAN BODY ORDER PLACED

The Erdman-Gaider Company, Detroit and Saginaw, has received a substantial order for Sheridan motor car bodies from the General Motors Corporation, the construction to be done at the Saginaw plant and the painting and trimming at the Detroit unit. Erdman-Gaider expects to manufacture at least 5,000 bodies this year.

VINCENT'S NEW MOTOR

An airplane engine designed especially for use at altitudes above 5,000 feet has been developed by Col. Jesse G. Vincent, vice-president of engineering of the Packard Motor Car Company, Detroit. The new motor, known as "1237 Packard," is said to be one of the lightest engines per horsepower ever built, producing, as it does, a maximum h. p. of 400 for a total weight of 725 pounds, or 1.85 per h. p. The engine is equipped with a safety stop which prevents opening the throttle full until an altitude of 5,000 feet has been reached. While built especially for Army and Navy use, it is expected that the motor will have wide commercial possibilities.

LINCOLN RE-ELECTS LELAND

Following his re-election as president of the Lincoln Motor Company, Detroit, Henry M. Leland reported that sales for February showed an increase of 130 per cent over those of January.

ALPERIN MANAGES KING SALES

The King Motor Car Company, Detroit, has appointed Herman Alperin, Buffalo, sales manager.

BEARINGS SERVICE PERSONNEL

The full roster of directors and officers of the Bearings Service Company, Detroit, which acts as service department for the Timken Roller Bearing Company, Hyatt Roller Bearing Company and New Departure Manufacturing Company, is as follows: Directors—Horace Ely, vice-president and treasurer, Timken Roller Bearing Company; Alfred K. Hebner, president and general manager, Bearings Service Company; L. M. Klinedinst, vice-president, Bearings Service Company and assistant manager of sales, Timken Roller Bearing Company; B. G. Koether, vice-president and assistant general manager, Hyatt Roller Bearing Company; Harry J. Porter, manager of sales, Timken Roller Bearing Company; Alfred P. Sloan, Jr., vice-president, General Motors Corporation; William M. Sweet, vice-president, Bearings Service Company and assistant secretary, General Motors Corporation.

The officers are: Alfred K. Hebner, president, L. M. Klinedinst, vice-president, William N. Sweet, vice-president, Dana H. Torrey, secretary, William A. Brooks, treasurer. Executive committee: Alfred K. Hebner, L. M. Klinedinst, William N. Sweet.

MOTOR SALES PICKING UP

James I. VanKeuren, of the Lansing First Bond & Mortgage Company, reports that agents of the concern throughout the state announce a decided increase in the sales of automobiles during the last month. These sales are largely for cash and are of the more moderately priced cars. While many have been out of work for a long time, few seem to have suffered or have been forced to sell their Liberty bonds, Mr. VanKeuren says. Savings deposits in the banks continue to increase. Mr. Van Keuren also finds considerable activity in the real estate line, with plans being made for the construction of many homes.

SPEEDING UP IN CLEVELAND

The Eaton axle division of the Standard Parts Company, Cleveland, is reported to have speeded up operations, principally on account of orders from C. Harold Wills & Company, Marysville. Another concern in the Cleveland district which has increased its activities is the Walker Motor Company, which makes engines for the Grant Motor Car Corporation. It is said to have received orders to double its output for Grant, which had been at the rate of 10 to 15 engines daily.

GIER INCREASING ITS LINE

The Gier Pressed Steel Company unit of the Motor Wheel Corporation, Lansing, is preparing to bring out more models of the new Gier pressed steel auto wheel, and in addition will make steel truck wheels. The company is also increasing its tractor parts output.

S. A. E. MEETS MAY 24-8

The summer meeting of the Society of Automotive Engineers will be held at West Baden, Ind., from Tuesday, May 24, to Saturday, May 28. It is expected that a large number of the members will then go to Indianapolis, which is only 120 miles distant, to attend the annual 500-mile race held on the speedway of the Hoosier city. According to present indications there will be a large attendance at the convention.

GMC DIVIDEND REPORTED UNCERTAIN

A report is current in the financial district of New York that it is not impossible that the next quarterly dividend of 25 cents a share on General Motors common stock will be passed. The matter will be decided at the meeting of the directors March 24. The New York report further says that the dividend has not been earned during the last 90 days but that General Motors business during March showed marked improvement.

Firestone Passes Dividend But Its Position Is Strong

Although the Firestone Tire & Rubber Company has passed the quarterly dividend on its common stock, its executives consider the out look as improving. As a matter of fact, says the Akron correspondent of the Cleveland Plain Dealer, the statement to the stockholders is the most optimistic that has emanated from Akron since the beginning of the tire slump, last May.

The announcement says the company has a surplus of approximately $33,000,000 and cash in banks in excess of $7,500,000 but that the passing of the dividend was deemed advisable to conserve cash resources so that the company might increase production and replenish stocks of finished tires that have been depleted during the last eight months. Officials estimate that sales during March will exceed $6,000,000. During peak months last year monthly sales averaged $10,000,000. As an indication that business is increasing, it was announced that several hundred men were added last week to the force and that two full eight-hour shifts were now working five days a week.

"We have reduced our sales and administrative expenses more than 60 per cent," says the statement, "which, with lower labor cost, gives us a firm foundation for increased production and increased earnings, justifying a resumption of the dividend on common stock the next quarter."

It was also stated that the company had set aside a fund for employes holding contracts under the employes' stock plan, paying them $1.50 a share, payment to be credited upon their contracts March 20.

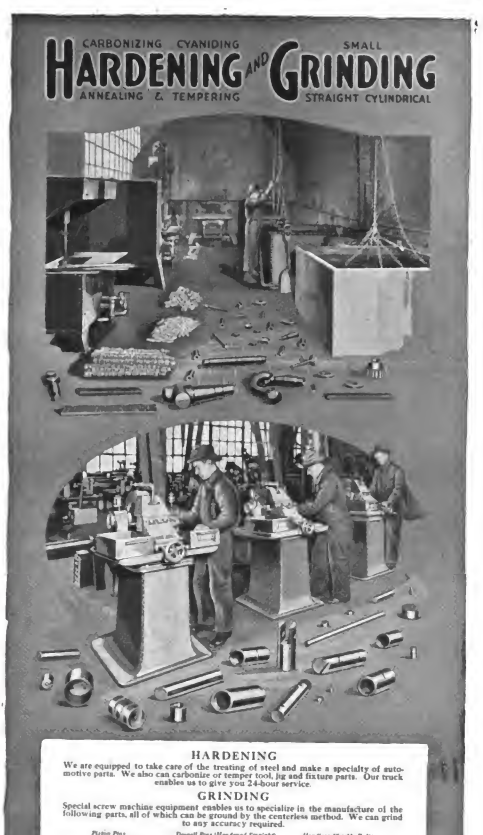
J. E. BURNS JOINS ALLEN

H. G. Elwell has resigned as sales and advertising manager of the Allen Motor Car Company, Columbus, O., and has been succeeded by Joseph E. Burns, who has been territorial representative for Allen. Mr. Burns formerly was connected with the Cole Motor Car Company, Indianapolis.

TRUCK MANAGERS PICK WHITTAKER

The National Association of Motor Truck Sales Managers has named Don F. Whittaker, formerly with the Federal and Acason companies, executive secretary, with headquarters at 1157 Book building, Detroit. Homer Hilton, who resigned as managing director, is now vice-president and general manager of the Winther Motor Truck Company. The association directors will meet March 25.

POND JOINS UNITED BODY



Leo S. Pond, formerly assistant manager of the Lansing Body Company, has been appointed district sales manager of the United Automotive Body Company, Lansing, which manufactures and distributes all types of commercial bodies. Large orders are on hand from both outside and local truck manufacturers.

J. C. FLEMING GOING ABROAD

J. C. Fleming, president of Detroit Hoist & Machine Company, will sail on the Steamer Finland, March 26, for a two months trip to Belgium, France and England. He will visit his brother in Brussels, who is president of the American Board of Commerce of that city, and also representative of the United States Steel Products Company. Mr. Fleming will confer with the company's export agents in the different countries.

MERRYWEATHER ON DAVENPORT BOARD

George E. Merryweather, president of the Motch & Merryweather Machinery Company, has become a member of the board of directors of the Davenport Machine Tool Company, Inc., Rochester, N. Y.

Transportation

Lansing—A marked increase is noted in the volume of both outgoing and incoming freight in Lansing on both the steam and electric lines, and railroads are adding to their forces. Some of the largest consignments in many months are being received and sent out from the local yards. The Michigan Central has organized another switching crew and now has five crews in the Lansing yards. The amount of less-than-carload shipments is unusually large, as many factories are purchasing material only for orders they have on hand.

Port Huron—The Grand Trunk shops, which were reopened two weeks ago, have been closed again and it is reported that the reopening probably will not take place until April 1. Several hundred men are thus again temporarily thrown out of work.

Lansing—Petitions relative to the sale of the Lansing Connecting Railroad Company to the Grand Trunk have been filed with the Michigan Public Utilities Commission by Joseph H. Dunnebacke, counsel for the local road. After advertising the petition for three weeks the Commission either will confirm or deny it. The Lansing railroad has no debts. It has no physical connection with local lines except the Pere Marquette, which also bid for the property. The Grand Trunk will establish physical connections with the road, and this will give a new freight outlet to 12 local factories.

Mansfield Steel Corp. Buys Detroit Trailer Co.

At the annual meeting of the stockholders of the Detroit Trailer Company the following officers were elected: J. B. Mansfield, president and general manager; Stephen A. Griggs, Walkerville, Ont., vice-president; E. B. Newton, treasurer, and F. L. Tully, secretary.

S. A. Griggs, who has retired from the presidency, has been in the harness continuously without a day's loss of time for fifty-five years and felt that he had reached that time of life where he was entitled to a well-earned rest. He has sold to Mr. Mansfield and his associates a controlling interest in the Detroit Trailer Company. Association with the management of the Mansfield Steel Corporation places the trailer company in a position to meet any and all requirements and competition.

The Mansfield Steel Corporation, of which Mr. Mansfield is also president, is possibly the largest steel body building corporation in the United States. It makes a specialty of all kinds of steel placing of the Detroit Trailer Company under the same management will enable it to sell its trailers complete with all kinds of steel stake bodies, steel dump bodies, and steel bodies for its drop frame trailers for use in the hauling of garbage.

The Mansfield Steel Corporation announces that its steel is all completely fabricated for its addition, which will be 85 feet by 155 feet deep. Plans were prepared by Smith, Hinchman & Grylls, Detroit architects. This building will be erected immediately, to be completed on or about May 15. This addition to the plant will house show rooms and finished stock of the Detroit Trailer Company.

Directors of the trailer company have been elected as follows: Stephen A. Griggs, J. B. Mansfield and F. L. Tully.

WYANDOTTE B. OF C. ELECTS

Charles Gartner has been elected president, Hubert S. Amoit vice-president, and James C. Headman treasurer of the reorganized Wyandotte Board of Commerce. A paid secretary and manager will be named later. Meanwhile James Pinson, who has acted as secretary since November, will continue to serve temporarily.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Detroit—Contracts for two school buildings to cost $2,000,000 have been awarded by the Detroit Board of Education, and a supplementary estimate of $29,182 will be asked for two temporary buildings on sites purchased by the board.

Pontiac—The Pontiac jail building committee last week opened the bids received on the intended new jail, and as had been the case on two previous occasions, the estimates were higher than the amount allowed by the appropriation. However, owing to stipulated allowances and deductions, it is expected that no fourth call will be necessary. Total amount available is $375,000. Following are the new bids: S. E. Benjamin Company, Detroit, $184,985, less $26,779 deductions; DuBois Construction Company, Flint, $194,293, less $19,577; Culbertson & Kelly Company, Detroit, $187,470, and certain deductions; W. H. Ingrigg & Son, Pontiac, $187,965, less $20,666. Bids for the equipment were as follows: Stewart Iron Works, Cincinnati, $175,348, less $43,668; Whitehead & Kales Company, Detroit, $165,375, less $43,885; Panly Jail Building Company, St. Louis, Mo., $201,575, less $57,456; Van Dorn Iron Works, Cleveland, $159,407, less $45,669. There were three bids on heating, ranging from $14,796 to $16,653, with reductions of $2,611 to $3,030.

Lansing—The Briggs Company, which has just passed its sixteenth year, looks for an unusually brisk building season. The company handles all building materials except lumber and employs 18 salesmen in Michigan, Ohio, Indiana, Illinois and Wisconsin. Branch offices in Michigan are located in Detroit, Grand Rapids and Flint. The company owns a large, modern face brick plant at Grand Ledge which manufactures 13,000,000 brick a year, and will erect soon a common brick and tile plant on a 100-acre tract of clay land at Durand.

Detroit—The week ended March 12 disclosed very little new in the way of industrial construction, contracts awarded by architects being largely of a private nature. There was quite a drop in the outlay represented in permits issued. The total was $622,840, as compared with $966,670 for the previous week and $3,340,900 for the corresponding week of 1920.

Grand Rapids—In point of number of permits issued, the week ended March 11 was the best thus far this year, there being 52 permits, which is 18 in excess of the previous best week. In expenditure represented, the week was the second best of the year, the total involved being $79,575, as compared with $108,128 for the week ended January 21. The majority of the permits were for residences.

Signs of Motor Revival Multiply

(*Continued from Page* 11)

been reporting better business in some sections of the country, but the condition does not prevail with the majority of the distributors.

"We do not feel pessimistic," said this man. "We only feel that the return of the business is going to be slow, very much slower than most of us had hoped and expected. There is only thing to do, and that is to be patient."

In connection with the declaration of its regular quarterly dividend the Chandler Motor Car Company, Cleveland, says: "Business for some time has shown a marked improvement and shipments are on a satisfactory basis and increasing. The company has a strong cash position, has a large volume of business on its books, and no indebtedness outside of current account."

The Auburn Automobile Company, Auburn, Ind., which also has declared its regular dividends, announced that sales in February were about 70 per cent of those of a year ago, same month, and that March sales were running ahead of last year's. Substantial cash balances, with no indebtedness except current accounts and taxes, were shown and the management expressed the belief that business had been considerably stimulated by recent substantial price reductions on all its models.

President L. Ludium, of the Autocar Company, Ardmore, Pa., one of the larger truck manufacturers, says: "The outlook is better than it was add it is my opinion that the natural supply and demand will regulate production." "Notwithstanding general conditions," adds the Philadelphia Record, "the company did $2,000,000 more business last year than in 1919, which increase was made during the first six months, while during the second half there was a small loss, leaving, however, a net profit of $70,000 in excess of the 1919 net."

In Akron, where most of the tires for the automotive industry are made, activities are increasing, but have not yet reached 50 per cent of normal. Most of the plants, big and little, now have a fair number of orders, which will keep them busy for some time. While definite data is not available, it appears that, taken as a whole, the tire makers are nearing 33 per cent of normal production. According to the Boston News Bureau, the Goodyear Tire & Rubber Company has increased production to 30 per cent of peak capacity of last July, or 60,000 tires a week. Some Goodyear dealers are quoted as having said that the shortage of tires forecast a month ago is already felt. The B. F. Goodrich Rubber Company is said to be making 7,200 tires a day. Firestone has not announced definitely what steps will be taken to increase production, says the Boston paper, but it is well known that resumption on the part of the Ford Motor Company has brought orders which will mean an increase.

In the March issue of the Buick Bulletin, the house organ of the Buick Motor Company, Flint, E. T. Strong, general sales manager writes as follows: "Why did five Chicago dealers on one day invest nearly a half a million dollars in Buick motor cars? There is but one answer. Why did Mr. Southworth, of the New York Buick branch, wire: 'Every indication points to very satisfactory business for the next three or four months. In figuring our requirements we will need upwards of 1,050 jobs between now and April 1'?

"Conditions existing throughout the country indicate that this spring and summer will see another shortage of Buick cars, even though we are planning our production so that we will disappoint as few buyers as possible.

"Dealers, visualizing the future, are making every effort to be able to provide spring and summer buyers with Buick cars. But, they are bound to be handicapped in their work unless buyers place their orders early."

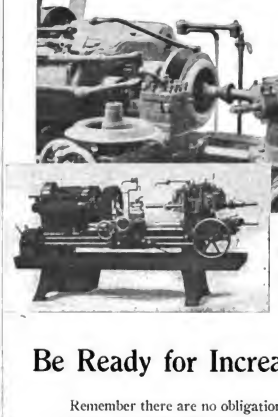
Third Builders' Show In Detroit, March 19-27

From the list of exhibits and the general plans so far recorded, the Third Annual Detroit Builders' Show, to be held in the Armory, March 19 to 27, will be informative and entertaining to a degree hitherto unknown. In building as in every other line of business calling for a considerable expenditure of money and a future investment, public confidence must be restored and intsrest reawakened.

If this builders' show does not accomplish both results it will not be the fault of the exhibition. It will mark the opening of the building season. The 82 exhibitors so far given space represent a 100 per cent increase over last year, and their exhibit quality will be far superior in every way. Undoubtedly both the contracting builders and the materials makers and dealers will have interesting revelations to make concerning building possibilities and costs.

The general desire for possession of a home is in no way diminished. It has merely been held in abeyance. What is needed is information and reiteration of the basic economic values of home ownership. To meet this demand the show manager, C. H. Mooney, has established an informatsn bureau where builders, material men and prospective home owners can, without the payment of a fee, obtain answers to all questions which have been troubling them. This bureau will be prepared to answer all questions concerning materials best adapted to various types of buildings, plans, costs, ventilation, fireproofing, loans, insurance, investment returns and other details.

Included in the entertainment program will be historical lectures by C. M. Burton, illustrated with 300 stereoptican slides showing the progress of building in Detroit since 1700; band and orchestral concerts in the exhibition hall; vocal numbers; an exhibition by the Michigan State Telephone Company, lectures on building and home-owning subjects, and motion pictures.



For every visitor, whether a prospective builder or not, the show will be a school of instruction. The American State Bank, Detroit, for instance, will have an exhibit explanatory of the banking business as it concerns building loans. Bank officials will be prepared to give information concerning the methods of financing home construction, and advice where it is desired.

DETROIT GRAPHITE SALESMEN MEET

Business and pleasnre was the agreeable mixture served to some 125 branch office managers and salesmen of the Detroit Graphite Company, Detroit, who came last week to attend a four-day convention. The business meetings were held at the factory and the intermissions were taken up, among other things, with two banquets; one at the Detroit Athletic Club, and the other at the Hotel Statler. There also was a theater party at the Garrick. F. W. Davis, Jr., president of the company, delivered the welcoming address and discussed problems affecting the sale of paint in the various industrial fields, defining sales and service policy. Vice-President T. R. Wyles discussed phases of paint manufacture and sale.

The fact was brought out during the convention that during the last five years business of the company has grown 600 per cent, with a corresponding increase in both manufacturing and selling forces. In this period the manufacturing facilities have been increased twice, a new pulverizing plant has been erected and a five-story administration building put up.

It was the first convention of the entire sales force at the home office in the last four years.

DETROIT, SATURDAY, MARCH 19, 1921

The Automobile Trade and Its Fair

FOLLOWING the custom of years, this paper issues this week a section largely devoted to the automobile industry. This comes in connection with the annual fair, or motor car show, of the trade in Detroit. For years these shows have been the dating-point of the season's activities. This year it is awaited with more than ordinary anxiety, because of the conditions which have affected the trade for the last eight months. Much is expected of it in the way of impetus to manufacture, much in the way of relief of a situation, which, to say the least, has become very tense. We have not been doing as well as we should like to have been doing in the motor car business for some time. Our factories have had to cease production because the public was not buying. The great distributors have not been able to maintain their usual and ordinary credit relations with their customers because the Federal Reserve Bank threw a monkey-wrench into the machinery of their credit by declining to re-discount commercial paper based upon their transactions, on the theory that the motor car is a luxury rather than a necessity. The closing down of the motor car factories left the train of agencies of supply of materials and parts in the doldrums because they were dependent upon the activity of manufacturers to maintain a state of activity for themselves.

On the whole, the situation has been a bad one, but the clouds are breaking, and through the breaks the manufacturers begin to see the sunlight. It is to be hoped that the impetus given to sales on the occasion of an annual dealers' show in Detroit, which is really one of the great automobile fairs of the country, will be such as seriously to affect the activity of the trade to its betterment.

That such betterment has already partially arrived and is bound to continue until facilities are all in use again is beyond question. A necessity of life and trade, which has been put into service by the hundreds of thousands each year for a considerable number of years past, is not likely to go into sudden disuse. Nobody dreams of recurrence to the horse-drawn vehicle in exchange for the mechanically driven one. The motor cars that have been put out are, therefore, in use. Being in use they must, perforce, wear out. Whatever the pinch for money, whatever the hesitancy about investing in renewals, the people whose motor cars and trucks have outlived their usefulness must acquire new ones. This necessity of replacement was part of the demand of the factories before they closed down so generally. Their period of idleness has already lasted so long that the mere accumulation of necessities for replacement must by now constitute a very great aggregate of demand. If our information is true, and we have no occasion to doubt it, the factories are already in receipt of considerable orders from this source alone. Great industrial organizations of the quantity production type cannot afford to reorganize and go back into production until their advance orders have accumulated in sufficient quantity to make the run worth while. This process of accumulation has been going on for quite a few weeks now.

The country is making money today, although not in quite the degree that it made money some years ago. But even on the basis of its money-making of the several years ago period, it was a large buyer and consumer of automotive vehicle product. It was during that period that the great foundations of the industry were laid. With the prosperity still evident, and with the betterment bound to come from a change in the federal administration and the consequent appeal to the psychology of the buying public, there seems to be no logical reason why proportionate buying should not be maintained and proportionate activity come to the industry.

Already the units of the industry are setting their wheels to spinning anew and making product. The greatest of the industries is already realizing half of its former production. The next in size in Detroit has just sent out a hurry call for its men. Several of the factories are putting out what would have been considered a satisfactory output a few years ago. While all is not cakes and all, still all is not distress.

The demand for the motor truck has, to a large extent, taken the place of the demand for the personal carriage, and if one reads the signs of the times aright, it looks as if a very substantial percentage of the motor car production of the future is going to be in the way of commercial vehicles. The facility with which work may be done by the truck, the independence of rail-side locations which it gives to small factories, the facility for intercity deliveries, the improvement and extension of the hard roads systems and a dozen other minor factors are contributing to this condition of demand. So long as the time of men employed continues to have more value than will permit it to be spent on managing horse-drawn vehicles, just so long are the economics of the situation bound to increase the demand for mechanically-driven carriers.

The motor show of 1921 marks, we believe, the beginning of a new era in motor car production and salesmanship. The industry is today Michigan's leader. Let us hope that the hammers will be clanging, the furnaces blazing and the wheels spinning all at their liveliest before the year is half old.

Getting Up Steam

WHILE subscriptions have not been coming in as rapidly as might be desired, it was gratifying to learn early in the week that approximately $20,000,000 of stock in the new $100,000,000 Foreign Trade Financing Corporation had been subscribed. This particular institution is the one which students of world commerce look to for solution of the riddle of how to sell goods to customers who have very little ready cash and whose credit is already seriously strained. The services of J. Rufus Wallingford may be needed before the problem is entirely solved, but in the meantime there come reports of actual functioning on the part of some of the earlier Edge law banks.

New York bankers say that hardly a day passes but a horde of agents of foreign purchasers seek credit to finance the acquisition of American goods. In many instances the borrowers are known to have good credit ratings, but because of conditions in Europe and South America much longer terms are needed than either the commercial banks or the Edge law banks, which deal in short term foreign credits, are in position to grant. It is just in this respect that the Foreign Trade Financing Corporation will fill the gap. However, the ingenuity of the Yankee financier is making itself evident, as is illustrated by the following example:

Advices from New Orleans are that the Federal International Banking Company of that city has joined with the First Federal Foreign Banking Association of New York in extending a 90-day credit to certain cotton shippers whereby 15,000 bales of low grade cotton will be shipped to mills in

Digitized by Google

Czecho-Slovakia. These mills will fabricate the cotton and retain a portion of the raw cotton for their services, and the finished product will be sold in central Europe. Title to the goods is guaranteed by a bank in Prague.

This is believed to be a new machine in foreign trade. It gives the Czecho-Slovaks an opportunity to run their mills without paying out cash for raw materials and suffering discount on payments due to exchange conditions. Likewise the Southern cotton grower obtains a market which would not be otherwise available and the foreign banking corporations do not have to advance any funds except to cover freight and insurance costs. When the goods are finished they will be sold to those parts of Europe that are in position to pay for them.

Mr. Mellon and His Tasks

NO MAN ever faced more perplexing fiscal problems of magitude than the new Secretary of the Treasury, Andrew W. Mellon. So far as the financing of it is concerned, the war is still in progress. The burden of keeping the process of liquidating the debt going has only been transferred from one pair of shoulders to another.

One of the most important and at the same time most pressing problems of the Treasury has to do with financing the heavy Treasury obligations. Upwards of $8,000,000,000 of government securities will have to be paid off or refunded within the next two years, and one of the first indications of Mr. Mellon's ability to cope with the duties of his high office will be the measures he adopts to take care of this situation. One of the fundamentals economists will agree, is that there be no aggravation of the present intolerable situation in which the Government is bidding against industry and commerce for funds. If Mr. Mellon is able to find a way out, he will have proved his metal.

It is significant that he starts with both feet on the ground. In his first public statement the Secretary reminds us quite bluntly that we need not expect to find a cure-all for our financial ills. The only relief, he says, will lie in the strictest kind of thrift, both public and private. He means that the foundation of our banking structure of the next few years will have to be built broader; in other words, that the foundation of credit, savings deposits, will have to increase. And on the other hand, we shall have to do away with the frills in government. In other words, both the governed and the governing will have to co-operate. There can be no remission at either end. This is good common sense and the right basis on which to build.

No man ever assumed the management of the Treasury Department more of a stranger to the public at large than does Andrew W. Mellon. That does not mean that the new Secretary is not a man of large ability. It was rather his aversion to any form of publicity that has kept him out of print, although his personal success has been one of the most conspicuous. A dispatch out of Pittsburgh, his home, says that "those who know Andrew W. Mellon intimately consider him the greatest constructive genius ever called upon to administer the Treasury." And it goes on to enumerate some of his achievements.

Mr. Mellon has resigned as president of the Mellon National Bank, vice-president of the Union Savings Bank, both of Pittsburgh, and as a director of the National Bank of Commerce in New York and a number of other corporations. He has been an officer or director of more than 50 business enterprises. His early training was looked after by his father, Judge Thomas Mellon, one of the big men in Pennsylvania finance in his day. It was at this time that the younger Mellon evinced a genius for organization. The latter was brought into play in his participation in the affairs of the Aluminum Company of America, for the remarkable success of which he is given a good share of the credit. The Standard Steel Car Company, which was acquired by the Mellons in a weakened financial condition, and the Gulf Oil Corporation, to which they gave their attention, have developed into two of the outstanding concerns in their lines. It is said of Mr. Mellon that "whatever he touched turned to gold." It must have, for at the time of his acceptance of the Treasury portfolio he was an officer or director of corporations with aggregate capitalization in excess of $1,600,000,000. The Secretary has devoted much time to the study of national and international banking and is said to have a keen insight into both.

In view of his record, and because of his disinclination to be a limelighter, much may be expected of Mellon.

Short Measure Stuff

CHRISTOPHER MORELY, who columns for the New York Evening Post, will have to excuse us for snitching the following from his column, which he reprints from the Park County Enterprise, Cody, Wyo.:

OHM, SWEET OHM, SAYS CHRISTOPHER

"The rumor that J. H. Vogel, our popular undertaker, was electrocuted during the mass meeting at the Masonic Temple last Wednesday evening, is, we are happy to say, untrue.

"It was reported that A. S. McClain of the electric light company had wired the chairs, and at the psychological moment when Mr. L. L. Newton asked for all present who would subscribe $1,000 for a hotel on this side of the river to please rise, McClain turned on the electric current.

"It was alleged that everybody rose with alacrity except J. H. Vogel, who preferred death and was burned to a crackling in his chair.

"We have been unable to trace this rumor to its source, but we are glad to contradict it, and the least we can wish Mr. Vogel is that he may live to bury us all."

* * *

Everything gets settled on its merits some day.

* * *

TRAINING CAMP INTERVIEWS

"I'm as good as I was seaven before last."
"Watch me show up some of those old-timers with my fast one."
"I'm fifteen pounds lighter than I was at this time a year ago."
"If that trainer'd only gimme a chance, I'd show 'em something."
"The manager's got it in for me."
"Come up to the hotel tonight and sit in."

The Turn of the Road

SPECIAL advices from J. J. Earley, president of the North Dakota Bankers Association, state that the Supreme Court of North Dakota has just decided by a 4 to 1 vote that the Bank of North Dakota is a "bank" and not a department of state, and that it therefore is subject to garnishment or any other legal process. This is a body blow to the Non-Partisan League interests in that it will result in immediate pressing of all claims by depositing banks and municipal treasurers who have been unable to withdraw tax money. As shown by the last official statement issued by the Bank of North Dakota, and printed in this publication last week, the total of demand deposits totals more than $12,652,000 and the only available cash assets were at the time of the statement less than $100,000. There was $2,607,000 of loans outstanding, part of which is collectible and $6,204,000 redeposited in state banks, more than $1,000,000 of which is tied up in the thirty-odd closed banks and the balance largely subject to offset in case of withdrawal by deposits of the state banks with the Bank of North Dakota. A close estimate of the available cash resources of the Bank of North Dakota today which can be marshalled to pay up to $13,000,000 deposits is less than $3,000,000. And $1,000,000 of bills payable is not included therein.

A more serious development in connection with the winding-up of the Bank of North Dakota, which now seems certain, is the probability of finding "non-book liabilities" or other contingent contracts which are not shown on the bank's books. No one knows outside of the League officials who have run the Bank of Dakota to what extent the officials have gone in pledging assets and borrowing money to keep the institution alive since December when the state legislature started to yank the skeletons out of the bank's closets. But it is uniform opinion by the conservative bankers of North Dakota that this decision of the Supreme Court marks the first sharp turn in the road toward bringing the finances of the state out of the chaos created by the Townley schemes.

FINANCIAL

The Outlook

By PHIL S. HANNA

The tone of business the last week undeniably has hettered. There are copious signs of improved sentiment notwithstanding unwelcome news regarding the railroad situation. The latter is such a large and far-reaching factor making for the good or ill of business that it cannot for long be overlooked, but in spite of this stumbling block there is testimony on all sides of improvement. The stock exchange professionals have about given up trying to hold back the tide of growing confidence in stocks. Canada soon will pay us $25,000,000, mostly in gold, and, best of all, perhaps, secretary Mellon states that ordinary income of the Government for eight months to February 28 exceeded outgo by $186,115,506.

The Detroit clearings for the week ended Wednesday were $96,000,000, of which about $20,000,000 was income tax payments, but notwithstanding, a net of $76,000,000 represents the first upturn since the first of the year. Bank deposits will show a temporary falling off because of the income tax payments, but the converts to the savings account doctrine are beginning to replace capital heretofore withdrawn by the needy ones.

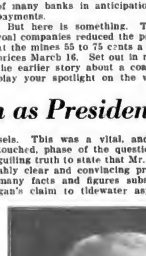
But no consideration of the future of business can be had without taking in world conditions. It is herein that one gets his encouragement. British treasury bills were reduced from a 6¼ per cent to a 6 per cent rate, March 12, which is everywhere conceded a forerunner of cheaper rates and more plentiful money. Almost simultaneously the Treasury Department at Washington announced a reduction from 6 to 5¾ per cent on the new issue of certificates of indebtedness in case of the long-term certificates. The Federal Reserve Banks combined increased the reserve ratio from 50.8 last week to 50.9, notwithstanding slightly increased accommodations to member banks amounting to $37,000,000. Member banks' reserve deposits went up $26,000,000. Doubtless the increases reflect preparations on the part of many banks in anticipation of income tax payments.

But here is something. The Erie railroad coal companies reduced the price of anthracite at the mines 55 to 75 cents a ton below quoted prices March 16. Set out in relief against this the earlier story about a coal shortage. Also play your spotlight on the various advertisements for coal salesmen. If older heads in the coal business are to be trusted, the consumer may even yet make his own bargain with the coal man. One wholesaler believes that there is as much coal above ground that any further breaks by operators to hurry sales may result in the consumer's obtaining coal during the summer for cost at the mines plus freight. We like the sound of this immensely.

Bond Men on the Lord Bill

Some of the bond men are apprehensive lest the Lord bill, which is apt to become a law, may interfere with their municipal bond sales. But there is another side to it, for, as one of the largest municipal dealers says, "The effect of the law may mean a building boom for Detroit which will give us a chance to handle mortgage bonds, in which there is greater margin of profit." And another opines: "Yes, as matters have stood the last few years, we have had to do an increasingly large municipal turnover to maintain a steady level of profit."

But, better than these reasons, there is the outlook under the Lord bill of more money for industry, which means an increasing number of savers, more bank deposits and more money locally for all good bonds. In the end the bond merchant should gain by the passage of the Lord bill.



Mr. Russell's Election as President of the Board of Commerce

DIRECTORS of the Detroit Board of Commerce chose officers this week for the ensuing year. Under the circumstances it is difficult to chronicle with becoming modesty that part of the election which placed John A. Russell, editor of this paper, at the head of Detroit's business organization.

The honor conferred on Mr. Russell is perhaps the greatest within the gift of Detroit business men, and it comes to him after many years of service in the ranks of the organization workers. For the last four terms Mr. Russell has served as first vice-president. The position, however, is even more important because of the opportunity it offers to serve. Perhaps the present generation will not again face a period when the need of a vigorous, serviceable, thorough-going "agency of business for the best interests of business," such as is the Board of Commerce of Detroit, will be as great as it is today. The responsibilities resting on the shoulders of the new board are of the same measure as the need for their services.

With respect to the service opportunity which this election brings to Mr. Russell, Detroit may contemplate the future by reviewing some of the major activities of the Board of Commerce which were initiated or supported by the newly elected president.

Of first rank, no doubt, and most recent, was Mr. Russell's presentation of Michigan's case before the International Joint Commission of the United States and Canada which held hearings in Detroit and elsewhere last summer on the proposed Great Lakes-St. Lawrence deep waterway route. It was Mr. Russell who brought home to Michigan people, and to the Commission, the fact that our tanneries, our pottery interests, our furniture interests, our paper manufacturers, our sugar factories and many other industries normally provide suitable incoming cargoes for boats sailing from foreign ports which may balance the round-trips into Great Lake ports of ocean-going vessels. This was a vital, and theretofore untouched, phase of the question. It is not beguiling truth to state that Mr. Russell's remarkably clear and convincing presentation of the many facts and figures substantiating Michigan's claim to tidewater aspirations, on the basis of economic expediency and justification, had telling effect on the deliberations of the investigating body.

JOHN A. RUSSELL

Other achievements of the Board of Commerce, the initiation and success of which was due in part to Mr. Russell's efforts, were those of obtaining reductions in the city tax levies of $500,000 in 1902 and $350,000 in 1916, also a saving of $600,000 in 1903 through elimination of extravagant proposals for the new city hall, Belle Isle casino and Art Museum additions. The $1,500,000 Detroit United Railway freight terminal and the $1,000,000 Grand Trunk freight distributing yards obtained in 1916 were among other achievements. Again, there was the organization of the Americanization Bureau of the Board of Commerce, which has done much toward making Detroit aliens better members of the community. In 1911 the first public hearing on obtaining the equalization of state taxes for Wayne county was promoted, when encouraging reductions were obtained. Then there came the fight for reasonable freight rates and transfer charges, wherein Mr. Russell represented the people of Detroit before the Michigan Railroad Commission. And last, but none the less important, the organization of a bureau of commercial and industrial statistics which has the reputation of being the most complete and dependable of any similar body in the country.

As Detroit goes on through the business readjustment period, which is now ushered in as a successor to the last five years of boom and bluster, it may look forward to greater achievements and more intense service from its Board of Commerce, the guaranty of which is the following complete roster of the officers which were elected March 16:

President, John A. Russell; first vice-president, Harvey B. Wallace, president, Wheel Trueing Tool Company; second vice-president, Arthur T. Waterfall, vice-president and assistant general manager, Dodge Brothers; third vice-president, Thomas J. Marsden, vice-president, Lee & Cady; treasurer, W. L. Davis, of Fenton, Corrigan & Boyle, investment bankers; secretary, Harry B. Warner. New directors elected are: John A. Brown, vice-president, T. B. Rayl Company, and Lynn B. Dudley, advertising manager, Federal Motor Truck Company.—P. S. H.

State of San Paulo, Brazil

15-Year 8% Sinking Fund Gold Bonds

Issue $10,000,000

THE State of San Paulo is the economic center of Brazil, with total resources estimated four billion dollars. Its total debt is very low—$25 per capita.

These bonds are a direct obligation of the State, further secured by the tax on coffee exports. A sinking fund operates to retire the entire issue at 105 at or before maturity, making the par value $1,050 per $1,000 bond.

The credit of the State has always ranked high; since 1906 it has retired about $144,000,000 of its bonds.

Price to Yield about 8.47%
(if held until maturity)

MANAGED BY MEN YOU KNOW

ABLE BUSINESS MEN FAVOR LIVING TRUSTS

More and more, men of affairs are employing the plan of the Living Trust for various purposes.

A living Trust will assure a child's college education; a daughter's financial independence; a son capital to enter business when of age; an old age competence for relatives.

Men in the thick of business who must take constant risks with their resources find Living Trusts useful in assuring their family's security, come what may.

Who's Who in Michigan Finance

Alvah D. Crimmins, Cashier, Charlevoix State Savings Bank, Charlevoix

When the Michigan Bankers' Association held its 1919 convention at Charlevoix there were very few delegates who failed to make or renew acquaintance with the genial cashier of the Charlevoix State Savings Bank. Alvah D. Crimmins' "long suit" is personality, although he is no mean hand at lending money safely and profitably, and he has come up into prominence in banking circles rapidly therefor. Mr. Crimmins was born at Marysville, Mich., in 1888, February 19, which was long before C. Harold Wills had any idea of building automobiles or building docks for his yacht to hitch to at little hamlet. He finished high school and went to Ferris Institute, at Big Rapids, and became bookkeeper in 1906 at the Bank of Copemish, Manistee county. By 1909, when he was only 21, he became cashier of the Bank of Mesick, at Mesick, where he remained until 1916, when he purchased an interest in the Charlevoix State Savings Bank and became cashier as successor to W. J. Rachow. Under his management the bank has grown from total footings of $265,954.35, on December 27, 1916, to more than half a million dollars.

A. D. CRIMMINS

Mr. Crimmins is also vice-president and director of the new Peoples State Bank of Hoyne City.

BETTER NEWS FROM BRITAIN

According to information furnished to Percy Owen, president of the Liberty Motor Car Company by friends writing from England, there are many encouraging trends in business affairs of Great Britain. Conspicuous among sentiments expressed is that money in England is soon to be available at cheaper rates. It is also stated that the shipbuilding industry of Great Britain is receiving a steady supply of orders. Unemployment is given as 1,500,000 out of 45,000,000 population, but the situation is improving.

WOMAN BANK PRESIDENT DIES

Mrs. Mary E. Webber, who died a few days ago in Portland at the age of 74 years, had been president of the Webber State Bank during the last three years, having been elected to the position by the directors at the death of her husband. Her daughter, Lorenzo Webber, is cashier of the bank.

S. S. KRESGE STATEMENT

A comparative annual statement of the S. S. Kresge Company, Detroit, is presented herewith, as of December 31, 1920, with December 31, 1919. The 1920 statement includes figures of the Mount Clemens Pottery Company, which was acquired recently. Construction has begun on a large addition to the Mount Clemens plant and the first of the new kilns has been put into operation. The rate of output was in excess of the entire output of the former plant. The number of employes has been increased from 86 to 250. A comparative record of sales is also given following the balance sheet.

EMPLOYMENT SITUATION IMPROVES

Latest reports from the Employers' Association of Detroit show a marked increase in factory payrolls. The 79 plants represented in the Association now have 67,137 employes, as against 8,000 when the depression set in several months ago. Forty of these plants are employing 41,668 on a schedule calling for 39 working hours a week.

She Will Need Faithful Counsel

When you are gone your good counsel and thoughtful care are gone, too. Your wife and your executor are left to settle up your numerous, and often complicated, activities.

Careful men make wills. It is the only safe way to assure the carrying out of their plans for their families.

Certain it is that you know best how your estate should be divided.

And you know best, too, whom you should have as executor of your will—someone experienced, faithful and never-dying who will carry out your wishes to the letter—who will give faithful counsel to your family.

Trust Companies are ideal executors because it is their business to fulfill duties of trust. They have the necessary knowledge and facilities. They have a permanence in organization which means that neither death, sickness nor absence can interrupt the settling up of estates.

The Union Trust Company has acted in the capacity of executor or co-executor of hundreds of wills. It has the experience gained in thirty years of service. Its officers will gladly give you their expert counsel. Let us send you valuable literature on wills and executors.

Union Trust Company

First trust company in Detroit.

NEW SAVINGS MANAGER

W. J. Kinmot, who was for 10 years connected with the Old Commercial National Bank of Detroit, has become manager of the savings department of the First and Old Detroit National Bank, succeeding W. J. Rachow, who has gone into the banking business in Hamtramck.

NOBLE OIL ASSETS $19,271,000

Bauer & Clark, appraisers for H. W. Noble & Company, Detroit, have recently completed an appraisal of the Noble Oil & Gas Company holdings which shows assets of the company, less depreciation, to be $19,271,000. The total indebtedness is reported as less than $1,250,000. Book value of Noble common, based on these figures and after allowing for the preferred stock and all indebtedness, is $1.65 a share.

The stock exchange was advised Wednesday that the next dividend probably would be paid April 15 to stock of record April 1.

*Deficit.

Despite the fact that the company ended its fiscal year December 31, 1920, with a deficit of $129,936.54, the condition of its finances would appear to justify faith in the future. Many manufacturing companies ended the year with swollen inventories and swollen fixed investments but in the main there has been an accompanying swell in liabilities, which in this instance has not taken place. Current assets decreased $294,000 but the total is still more than five times current liabilities. Eighty-two thousand dollars was taken out of profits to retire preferred stock.

Unfilled orders as of March 1 are reported as approximately $2,000,000.

UNITED LIGHT AND RAILWAYS COMPANY

Davenport—Chicago—Grand Rapids

Common Stock Dividend No. 3

The Board of Directors has declared a dividend of one and one-half (1½) per cent on the First Preferred Stock, payable out of the surplus earnings, on April 1, 1921, to stockholders of record at the close of business Tuesday, March 15, 1921.

First Preferred Stock transfer books will reopen for transfer of stock certificates at the opening of business, March 16, 1921.

Durant Stock Sale Analysis

IN NOVEMBER, when W. C. Durant went to the du Pont people and obtained their assistance in financing the large block of stock theretofore owned by Mr. Durant, there was an abundance of speculation and gossip in the New York financial papers as to the price at which the stock was taken over by the du Ponts and as to the amount of cash which the transaction netted Mr. Durant. The gossip at that time was to the effect that stock worth about $27,000,000 was pledged to secure bank loans aggregating about $20,000,000, and that in the transaction Mr. Durant paid off the banks and realized something less than $7,000,000 in cash.

On Saturday of last week the annual report of E. I. du Pont de Nemours & Company was issued. It was revealed therein that Mr. Durant received $23,790,600 in cash and 40,000 shares of common stock of the du Pont Securities Company for 2,504,273 shares of General Motors common, and that afterward the 40,000 shares of the du Pont Securities Company was exchanged for 230,000 shares of General Motors common. The result, therefore was that Mr. Durant received $23,790,600 in cash for 2,274,273 shares, or about $10.40 a share, and had 230,000 shares remaining of an aggregate value of $3,980,000, based on $13 a share. Cash proceeds therefore were $3,790,600 above the assumed bank indebtedness of $20,000,000, and the value of 230,000 shares of General Motors common at $13, or $2,990,000, would bring his cash and equities growing out of the transaction up to $6,780,600.

Those who believe that even the du Ponts have $27,000,000 cash lying around loose these days may find interest in the description of how the du Pont Securities Company raised the necessary cash involved in the transaction and how it acquired the necessary General Motors stock which was put up as collateral. The du Pont Securities Company gave the du Pont American Industries (owned by E. I. du Pont de Nemours) $4,200,000 of its preferred stock and 38,000 shares of its common in exchange for $4,200,000 cash and 824,179 shares of GMC. It then gave the Chevrolet Motor Company $2,500,000 shares of its preferred stock and 24,000 shares of its common in exchange for $2,500,000 cash and 549,453 shares of GMC. It then pledged all the GMC stock so acquired, together with that of Mr. Durant, totaling 4,000,000 shares, with J. P. Morgan & Company for a loan of $20,000,000. This fund, with the two cash payments received from the du Pont American Industries and the Chevrolet company, totaling $7,000,000, brought the total cash funds up to $27,000,000, which it is assumed was used to pay the banks $20,000,000 and the remainder to Mr. Durant. The following table explains the transaction somewhat more clearly:

du Pont Securities Receipts		Company How Raised
Cash	GMC Stock	
$ 4,200,000	824,179 shares	Received from du Pont Amer. Industries in exchange for $4,200,000 pfd. stock du Pont Sec. Co. 38,000 shares com. stock du Pont Sec. Co.
$ 2,500,000	549,453 shares	Received from Chevrolet Co. in exchange for $2,500,000 pfd. stock du Pont Sec. Co. 24,000 shares com. stock du Pont Sec. Co.
	122,095 shares	Purchased from a syndicate for $2,163,857 cash or $17 per share.
"	2,504,273 shares	Purchased from Mr. Durant.
20,000,000		Borrowed from Morgan & Co. on 4,000,000 shares GMC acquired as above.
$27,000,000	4,000,000 shares	

WATERWAY HEARING FOR DETROIT

The International Joint Commission of the United States and Canada will conduct the final hearing on the proposed Great Lakes-St. Lawrence waterway and power project, at the Board of Commerce, Detroit, October 30. This will permit opponents and proponents to present their arguments for and against the project.

AN UNIQUE VELIE EXHIBIT

The Detroit distributor of the Velie has an unique exhibit in his Woodward avenue show room. The body of a touring car has been cut into cross section so as to show the different materials going into the construction of every part of the body and top. The other side of the car shows the different coats of paint and finishing materials used, the entire side being divided into sections, each of which shows the finish after first coat, second coat, etc., together with a brief description of each operation.

B. OF C. GAINS MEMBERS

The membership drive started Monday, March 14, by the Detroit Board of Commerce, is bringing results. Tuesday evening the members of the drive teams had dinner with the board of directors in the Board of Commerce grill room and heard reports of progress in obtaining new members. Lewis Cohane made a short talk on the accomplishments of the Board and his value to its members and the city of Detroit. His arguments were in the nature of a sales talk which was forceful and impressive. If any present were in doubt, Mr. Cohane "sold" them handsomely.

The membership drivers and the Board wish it understood that while every effort possible should be made during this week, the drive is to continue throughout the year. No manufacturer would attempt to sell his entire output in a single week, and it is the intention of the committee to spread its efforts over the whole year.

What Detroit Plants Are Buying

(Continued from Page 6)

firm, no matter how fine a record it has, can hope to get business with nothing more than that fine past record.

Without exception, every firm must do all it can to help along the immense after-the-war readjustment still ahead of us. All must do everything possible to get their costs down so that they can sell to their old customers at exceptionally low figures. If they do this, their customers in turn will then be able to go out and cope successfully with strongly competitive conditions. No firm can hope to keep in business if its policy is such as to be detrimental to the best interests of its various customers. And no policy is more detrimental to a firm's customers at the present time than the policy of some companies selling in this market, who expect their customers to carry them along purely on account of past favors.

Purchasing agents recognize their obligations to those firms which have helped them out so nobly in many serious situations during the last few years. But in the long, hard race ahead of us competitive conditions will not permit them to keep "tied up" with any firms who in the past were fine supports but in the present are clinging burdens.

I have emphasized this part of the situation so that the firms who are selling in this territory will not misunderstand the purchasing agent's viewpoint and the governing factors which he cannot get away from. Also, I do not believe there is a purchasing agent in this territory who is not personally anxious that every old, reliable source of supply shall continue in the same pleasant relations through its ability to meet every new condition.

In summing up the most important underlying factor in the automotive situation is that the industry as a whole has been and is now squarely facing the new conditions and rapidly making every adjustment necessary to prepare for the long, keenly competitive race ahead. In a corresponding degree the various purchasing divisions are adjusting themselves and their policies so they will be a real aid to their respective companies in the manufacture and sale of their particular make of motor cars.

A summary of what the individual companies are doing will undoubtedly be interesting.

At present the Studebaker Corporation is the most active motor car company in the buying market. Its inventory was relatively lower than nearly all other concerns when the slump came. As a result, it has been able to enter the market in a quantity sense sooner than the others. This is true with the exception of coal, of which the corporation still has a quantity of high-priced fuel on hand. To offset this, it is buying some four or five cars a week of the exceptionally good offers made. By this means it is bringing down its average coal cost.

The Ford Motor Company is releasing many of its orders which have been held up for some time. These releases are relatively larger in the large sized parts and units. This is because storage facilities have always acted to limit the number of such parts which could be taken in advance of production. In addition to these releases an appreciable amount of new business is being placed, either direct or through the accessory manufacturers who supply the company. These releases and new orders are, so far, entirely for the closed body cars. With reference to the tractor division the outlook is increasingly favorable. Many releases and some new orders are being placed to take care of a planned production schedule of 200 tractors a day. This is 50 per cent of the peak schedule last year.

The Ford purchasing department is going through a complete reorganization in which it is planned to carry on the purchasing with only a small fraction of the number previously employed.

The Cadillac, the Buick and the Reo are the other three motor car companies which are now doing a considerable amount of buying. Also, the Hupp and the Paige are in the market to a somewhat lesser extent. From present indications the Dodge, the Columbia, the Olds, the Denby and the Chevrolet will be buying various parts in appreciable amounts before the end of March. It is doubtful if any of the other motor car companies will be in the market for quantity production material before April at the earliest.

Buying in Small Quantities

Probably the most outstanding feature in the motor car buying activity to date is the exceptionally small quantities being ordered of each size and kind of material. This indicates that the present policy is entirely one of buying for immediate needs only.

The outlook is for a gradually increasing amount of buying, even though production schedules are not materially increased. The various inventories of stock are being worked down. As each particular part or kind of material is used up, releases of unfilled orders will be given, and after that new orders will be placed.

The activity among the accessory manufacturers is in direct proportion to the particular motor car manufacturers who are their customers.

The four leading stove manufacturers are sending out a considerable number of inquiries in preparation for a production of about 25 per cent of what it was this time last year.

The railroads and the manufacturers of railroad equipment are doing practically no buying of new equipment materials. This is partially due to the delay in the settlement of accounts and claims which the railroads have coming from the Government, and partially due to the fact that there is at present ample enough railroad equipment to handle all business which is moving. A third very important factor in the railroad situation is the national agreements which the Government forced upon

the roads in behalf of the various unions during the war. These agreements impose such a heavy operating burden upon the railroads that this situation is commanding almost the entire attention of the transportation executives. They feel that this matter must be solved before any planning can be done for increasing rolling stock and terminal facilities.

In addition to the various buying to take care of immediate requirements, a certain amount of purchasing is being done by those concerns which are in a financial position to take advantage of the exceptional offers being made to them.

For Future Delivery

The situation with reference to contracting for future deliveries is always one on which it is difficult to give any first hand information.

The professional buyer desires to give his company any competitive advantage possible through his contracting at the best possible time and price. He therefore generally does not want his plans widely known. So I am not in a position to give any specific information on this subject without violating confidences.

However, in general the amount of contracting being done in Detroit at present is considerably less than in most of the other buying centers. Purchasing agents in other centers, who for years have specialized in certain specific commodities, feel after a long and careful analysis of the situation the bottom of the market has been reached in a few of the raw materials, especially copper, tin, lead, zinc, cotton and rubber. Accordingly, many of them are placing exceptionally advantageous contracts at a sufficient margin under the open market prices to make them feel safe against any further open market declines which might take place, and at the same time to protect them against any market advances and against the withdrawal of such offers because of the continued improvement in the financial situation.

Only the future, of course, can determine definitely whether the purchasing heads of Detroit or of the other centers of the country are exercising the most farsighted judgment.

Milling Machines, When and How

(*Continued from Page 8*)

on a plain milling machine or a hand machine. The production in a case of this kind would be rather slow but it could be increased greatly by setting up another fixture at "C" on the same machine and loading the work "D" while the cutter is operating at "A".

Still greater production could be obtained by making an index fixture as shown at "E" in the lower left hand part of the illustration. In this case four pieces "F" can be milled at one time by arranging the cutters in the form of a gang as indicated. While these pieces are being milled, four more can be set up as shown at "G", so that when one group has been machined the indexing fixture can be rapidly swung around to mill the other side. In this way four pieces can be done at the same time with very little loss of time. The machine used in this case is a plain milling machine. Another method of setting a piece of this kind to obtain high production is shown at "H" in the same illustration. This fixture is placed on a rotary continuous milling machine and as the table revolves continuously there would be practically no loss of time during the operation. The operator can remove the finished work and load the fixture while it is revolving.

From these examples it will be seen that both the indexing and continuous types of fixtures will give high production and between the examples "E" and "H" there is very little choice. Whether there might be a little greater production obtained from one or the other would depend largely upon the shape of the parts which are to be machine and their relative position to each other.

The work shown at "A" in Fig. 4 is a cylinder which has been previously bored and machined at "B". It is necessary also to mill the surfaces at "C," "D" and "E". Now a piece of work of this kind can be machined in several different ways according to the production required. It is evident that for small production it would not be profitable to set up a heavy and expensive machine, while for large production it might be a decided advantage. The method shown at "F" makes use of a plain milling machine with a single cutter shown at "H". This cutter mills a single sur-

Small Corporations as Well as Large Should Appoint Transfer Agents and Registrars

Irrespective of their size, corporations should recognize the advisability of placing their Stock Transfer Department in experienced hands. The fact that the stock is not actively traded in is one of the best reasons for the employment of Transfer Agents.

The transfer of shares bristles with technical points and liabilities which a corporation is seldom equipped to handle and the infrequency of transfers is the usual cause of unfamiliarity, not only with the law regarding transfers but also with the safeguards against any irregularity. Corporations acting as their own Transfer Agents frequently incur liability which is not compensated by the slight economy effected.

Our officers will be glad to explain this service in detail.

SECURITY TRUST COMPANY
FORT AND GRISWOLD STS. CAPITAL AND SURPLUS $1,000,000.00 DETROIT

A Matter of Ratio

Few stock companies are undercapitalized—particularly when their stock is to be offered for sale. Generally they represent 100% stock and 50% security. With our First Mortgage Bonds it is different. We offer 50% bond and 100% security—plus the $7,000,000 resources of this corporation.

face "C", the work being set up on an angle plate fixture "G."

If this method were to be used, the second operation could be done on the same type of machine by means of the cutter "K," thus milling the upper surface on the casting "D." The work in this case would be set up on another angle plate "L." The third operation would be the milling of the surface "E" on the same type of machine and with a fixture similar to that shown at "G," except that the work would be set up in the opposite direction.

Now this method might be alright for small production, but when a great many pieces are to be milled it would be better to use a multi-spindle milling machine having three cutters us shown at "M," "N," and "O" in the same illustration. By this means a number of pieces could be set in a row on a fixture base "P" so that all three surfaces "C," "D," and "E" could be milled simultaneously. It is evident that this method would be more rapid than that previously described, as three cuts are being made at the same time.

A multiple spindle machine could also be used in the manner shown at "Q" by setting up the two pieces of work "A," so that the pads "D" and "E" on both pieces would be milled at the same time. It is evident that these pieces also would be set up in a row so that the cutters would operate on a number of pieces successfully. If this procedure were to be used, the surfaces "C" would be handled in another operation probably in a similar manner to the method shown at "F," except that several pieces could be set up on the same fixture if desired. It might also be profitable to set up two castings opposite each other on the duplex milling machine and do this final operation two pieces at a time on a suitable fixture.

In this case also it is evident that the amount of production required and the fixtures used are important factors in determining just how any pieces of work can best be machined. There is very little choice between the method shown at "P" and "Q," although in the former case all of the cuts made at one time, in the latter four surfaces are machined with the exception of the surface "C," yet two pieces of work can be fed through the machine in the same length of time that a single piece would be machined by the method "P."

Machining a Cylinder Head

Another example is shown in Fig. 5, which illustrates the various ways in which production can be increased in accordance with the amount of work required and the machines available. In the upper left hand illustration the work "A" is to be finished on the surface "B" and in this example the machine used is a plain milling machine with an inserted tooth cutter "C." The work is set up in this case on a simple fixture indicated at "D." This work could be done equally well on a vertical machine using a fixture like that shown at "E," provided the horizontal machine were not available. There would be an advantage in using this method, because the work could be set up more easily in this type of fixture than in the other. The method of clamping would be simpler because there would be no danger of tipping the piece out of position when clamping.

A duplex milling machine could also be used to advantage on this same piece of work as shown at "F." In this case four pieces could be set up as indicated and two surfaces would be machined at the same time in the same amount of time.

Going a step further, a multiple spindle machine could be used by locating the work as shown at "G," in such a way that three cutters could be in operation simultaneously. An arrangement like that shown at "H" could also be used on a multi-spindle machine, four pieces being set up so that they would all be milled at once. It is also evident that the work could be set up in a row in either of these two cases.

Another method could be used by utilizing a continuous rotary milling machine and making a suitable fixture to hold five pieces, as shown at "K." If this type of fixture were to be used there would be no lost time caused by loading and unloading the work, and yet it might not give as great a production as the examples "G" and "H" because in these cases several surfaces are being machined at the same time.

In determining whether a certain piece of work is suitable for circular continuous milling, the general shape of the piece is an important factor. Unless an arrangement can be made such that the parts are close together, it is not usually profitable to use this type of machine because there is so much lost time while the cutter is cutting "air" and therefore not producing work.

In analyzing a problem for this kind of milling, therefore, it is of great importance to decide whether it will be profitable or not. The ideal shape of work is that which is more or less triangular with sides sloping toward the center of the table, like the example shown at "A" in Fig. 6.

It will be noted that these pieces are roughly triangular in shape, so they can be set close together and clamped back against the locating pins "B" by means of suitable clamps "F." The work can be conveniently set up on the three points, "C," "D" and "E" in the fixture base "G." This example approaches the ideal condition for rotary continuous milling, as it is evident that the work is set up economically

Digitized by Google

and there is no time lost either by the work man in loading and unloading the fixture, or by the cutter which is operating continuously.

Another example which illustrates the possibilities of continuous milling is shown in the same illustration. The work "H" in this case is a forked stud which is to be straddle milled and slotted. In order to keep the ends of the work to be done, as close together as possible the pieces are set up from the inside of the ring fixture "K." Each piece is clamped by means of a special binding screw "M." The cutters used are arranged in multiple as shown clearly in the illustration.

These two examples, together with the others previously mentioned, will give the executive a very good idea of the factors which govern the selection of a circular continuous milling machine. It may be well here to mention the importance of high class tool engineering in connection with the design of fixtures. A first-class machine may be only partly efficient unless the fixtures used with it are designed by practical men of long experience in both shop and drafting room.

Index Milling Fixture

Everything which is done to save time while setting up and removing work from a fixture increases the production because it decreases the idle time on the machine. In other words, "keep the machine running and cutting continuously" if you wish to obtain maximum production from it. The tool engineer who knows his business understands this fundamental principle and designs his tools accordingly.

Many times it is possible to design an indexing fixture or a reciprocating fixture so that one piece of work can be loaded while another is being machined. It is evident that when this can be done the setting-up time is eliminated and the only lost time is in indexing and moving the milling machine table from one position to another. Fig. 7 shows an example of this kind in which the work "A" is to be faced across the top as indicated by the finish mark.

The work locates in V-blocks "B" and on the hardened stud "C" located in the indexing member "D" mounted on the base "H." The piece is clamped in place and held firmly by the swinging clamp "E" operated by the cam lever "F." The pins at "K" are intended to take the side thrust of the cutter and also to serve as a location sidewise. Suitable indexing pins are provided at "Q" to locate the indexing member when swinging it from one position to the other.

It is evident that the operator can load one piece while the cutter is facing the other, and as there is only one clamp to tighten the manipulation is very rapid. Fixtures of this general type can often be used to increase production when the work is of such a nature as to permit it. In the case illustrated it would also be possible to make two fixtures just alike and set them at opposite sides of the table. The same result could be obtained by this method but the operator would be obliged to work alternately on one side and the other which would not be quite as convenient. The production however would be about the same in either case.

Milling machines of special design can be obtained in considerable variety and they are useful for the particular kind of work for which they are designed. We have made no mention in this article of spline milling machines, thread milling machines, gear cutters, hobbing machines, etc., because these types are designed for special purposes and it would require more space than we have at our disposal to take up machining problems suitable for these machines. There are, however, occasional instances when high production is required in milling a certain piece of work which may normally require several operations.

Enter Davis; Exit Gompers

(Continued from Page 3)

I was in conference with him when he was debating over the portfolio that had been offered. I opposed his acceptance. I argued that he would not be a success in such a position; that his dream of encouraging better leadership in labor and bringing labor and capital together on a more friendly basis was visionary and impossible. I feared then and do now that he is not enough of an astute politician to handle the many problems he will confront.

"In the first place he goes into the cabinet believing that there must be a decrease in wages in many lines. While he believes in trade unionism, he does not believe in union leadership that is autocratic, and he will not tolerate dictation. Threats of strikes will not scare him. If Mr. Gompers or any other labor officials approaches the department in a threatening attitude Jim Davis will be as hard-boiled as they make them. And he can be hard boiled. He believes that unorganized labor has as much right to be heard as organized labor. He believes in the open shop principle where the open shop is just and most beneficial to labor. On the other hand he is not likely to lend himself to any plot or plan to destroy the closed shop where it is just and acceptable.

"Jim Davis is not a man without an understanding of the problems of the employer. He is an employer himself. He maintains an office with 15 or 25 clerks. He is interested in many lines of manufacturing. He is a capitalist if the possession of a fortune of $2,000,000 or more places him in that category. But he still holds his union card. Capitalist or trade unionist, he will be Secretary of Labor with capital letters. Of that much I am certain.

"I believe Davis was picked by Harding because he occupied this dual position, because his ability as an organizer and his desire to be just were well known to the President. I do not know just when or how Mr. Harding came to know Mr. Davis. Sometimes I am tempted to believe that Secretary of the Treasury Mellon had something to do with Mr. Harding's decision. President Harding had known Davis for years. Mr. Davis visited Mr. Harding several times in Marion, during the front porch campaign. While most of the Moose membership was inclined toward Governor Lowden, Jim was a Harding man and a Harding worker. Mr. Mellon and Mr. Davis are both from Pittsburgh. They were well aequainted there. They are directors in at least one concern that I know of.

"Both President Harding and Secretary Mellon knew as well as I did that Jim Davis had no sympathy with radicalism in labor; that he was bitterly opposed to destructive measures or 'direct action' in labor politics. Very likely they consider him as conservative as I do, and for that reason, coupled with his wide experience as a trade unionist, employer and organizer, President Harding chose him. He is a director-general of the Moose for life, elected to that position as a reward for all he has done for the order, and as a business proposition. He will do a great deal more.

"As Secretary of Labor I believe Mr. Davis will have the hardest task of his life. I am afraid he will be abused more than he will be loved. I hope he succeeds. If he does not it will not be because Jim did not do his darndest, because he was unjust or because he was not capable. It will be because to do the task as he would have it done is humanly impossible."

The Board of Commerce and the Future of Detroit

(Continued from Page 4)

When I assure you that these instances are only a few from among the many casual experiences of a citizen who is neither a manufacture nor a merchant, may we not assume that they are probably duplicated in the minds of a thousand other men of Detroit more familiar with trade conditions than myself?

With this wealth of information and of opportunity that is in hand today to be followed up, analyzed and corrected, you wonder that with a mild enthusiasm which I hope you will consider pardonable, I venture that we are already on the verge of necessity for doing for Detroit what the Commercial Museum of Stuttgart and the Bourse of Vienna and the Industrial Associations of Tokio and Nagasaki were forward enough and brave to do for the cities in which they were interested and whose commerce they reverenced?

TURN a moment now, if you please, to the local conditions which are to influence the commerce of our future. In the stress of the moment we are apt to grow impatient with the detail work of our city governments. But if we are philosophic enough to be occasionally introspective we will catch ourselves finding fault with things as they go on nowadays, and holding that they are not being done as well as they were at some given dates in the past. We forget that when, from the standpoint of the present, we approve the past, we are criticizing the activities of the past, too, while they were accruing and before they had become history.

With all its faults—and God knows it has many—with all its wastes, with all its crudity of endeavor, with all its opportunity for self-constituted critics to boost themselves into paying jobs as the exponents of public criticism generally ill-founded—the American municipal government is the most flexible and responsive instrument at the service of commerce and industry that can be found in the wide, wide world.

So we, in common with all our fellow Americans, may depend upon our city governments to do the work that commercial development demands. They may not be as speedy as we would like, conditions of public incomes may temporarily delay or divert them from useful purposes. But they generally arrive. Like the bedbug, which has no wings at all, they get there just the same. They are not making problems for industry and trade; industry and trade are making the problems for them.

We have many local problems in Detroit affecting our commercial and industrial development, but we have in this great community leaders many minds fitted to solve them. Most of them are continuing and will require continuous pottering with them. Smith Waterfall has told you what we need in railroad facilities. Well, we will get those because we and all the parties to that problem understand each other and know how to work together to solve it. We need increasing educational facilities. This Board and the school author.ties know how to educate the public to loosen its purse strings to provide them.

And so with all the rest, save two which seem outstanding. If we are to support an increasing commercial and industrial supremacy we need food and we need homes. Detroit's population today consumes every day a million pounds of flesh meat foods, a million of grain foods and two million pounds more of diversified foods, including vegetables. If we are to grow our population we shall double in food demands.

WE draw our flesh meat foods from a great distance. Yet we have twelve thousand square miles of lands in the lower peninsula of Michigan which are fit for grazing, and only the fringes of which are touched for that purpose. The farmers of our state produce thousands of tons of food products which they say rot in the fields for lack of good distribution. If ours is to be as self-contained a city as it should he, it should not be dependent upon far-away food markets. If it were conceivable that rail transportation should suddenly and generally stop, we have on an average in our city five days of food supply between us and distress. Yet that is not bad, either, for New York is rarely stocked for three days' feeding ahead.

If we are to support an industrial population, we must see that our food supplies are kept ample and above all, accessible.

It should be a civic crime for Detroit to permit the product of an acre of the soil of Michigan to be wasted. That opens up a work for this Board in support of the industries of Detroit, of varied character. It includes the encouragement of the raising of meat food animals in our state and bringing of them to our own markets; the extension of the use of grazing areas; the betterment of distribution by rail; the opening up of motor rcutes; the development of truck gardening in territory contiguous to our city; the conservation of food from the season of maturity through the seasons of consumption—a big work and a varied work, yes, but a work upon which the activity of forge and foundry and machine shop will depend in the future. In this work your Board is already engaged, but not upon the scale which its importance demands. There is opportunity for the voluntary work of a thousand members of this Board along these lines suggested.

THE other glaring need of this city is housing, and housing is dependent upon transportation. Our city's pride used to be that it was a city of individual homes and home owners. That made it a city of conservative workers because they were rooted to our soil, like the peasants of France. We are fast becoming a city of tenants and tenements. We were twenty-five thousand homes short last year. The same shortage will be accentuated when our wheels begin to turn again and the hammers once more ring in the forges.

The reason that we have not made individual homes in the quantity demanded has been that our centrally located home sites are too costly and we have pro-

Waiting to see what the other fellow is going to do isn't going to put you in the lead

This little lever covered by the thumb selects the speeds.

If all motor car manufacturers hold up decisions on improvements and changes,—there is sure to be a jam when they all let go.

To step out now, to take a decided lead by telling the public that the cars you are now to offer will *actually* have some new worth-while features, will bring what buying there is to you.

In a 50-per-cent year you can do a normal business or better.

Clean up your front floor board, take out the obstruction—the gear-shift lever and emergency brake. Replace one with the C-H Magnetic Gear Shift and move the brake to the extreme left side.

Finger lever control on the steering wheel saves the clothes of the women drivers, prevents stripping of gears,—makes driving easy. It places your car ahead, where it will command the attention of the public.

The C-H Magnetic Gear Shift is made by The Cutler-Hammer Mfg. Co., one of the largest electrical manufacturers in the world—maker of the magnetic motor control systems used in steel mills, machine shops, industrial plants, on battleships and submarines.

This $10,000,000.00 company has stood back of this Shift and, though obeying Uncle Sam's request to curtail operation during the war, has nearly 6,000 in satisfactory use.

If you want to make a real interest-arousing motor car announcement, equip your cars now with the C-H Magnetic Gear Shift. You'll need to make no experiments—the device is perfected, and The Cutler-Hammer Co. is back of every one installed.

B. of C. and Detroit

(*Continued from Page 34*)

200,000	

vided no facilities to get out into the open.

For thirty years we have fuddled with our transportation problem. Amateur Neros have played their out-starting fiddles. We have been interested in the access to and the exit from office of the favorites of the moment. But we have not provided transportation to the cheap heme sites. Instead, we have put more people to live to the acre on Hastings street than is good for them, more than live on an acre in any area outside of New York. We have crowded our retail and wholesale business into an area so congested that we have one of the most expensive conflagration districts in the United States, and we are paying the toll on it in insurance rates. We have taken from our home-owning workingman the privilege of choice of far-away urban employment, unless he sells his home and moves. We have made our tenants nomads who have to strike the r tents at every change of work. We levy a toll of two or three hours of daily travel as each worker's contribution for the privilege of doing a day's work.

We should find some way to reduce these tolls. These are excessive costs; these are imperceptible, but nonetheless real charges. When this Board sees its duty, and its members exercise their full influence in settling this problem once and for all, the greatest single contribution ever made to the permanency and settlement of industry in Detroit will have been made.

Gentlemen, this city of ours is worth it all. When St. Paul said: "I am a Roman," he spoke not more proudly than should you and I when we say, each for himself, "I am a Detroiter." His right to pride was not greater than ours.

On the escutcheon of the Prince of Wales is the pledge of his office to his people, a motto which reads: "I serve." The proud slogan of our neighbor metropolis, Chicago, is "I will." Is it too much to hope that the latter history of Detroit will show that the fealty pledge of this Board of Commerce to its community is not the subservient declaration of the one, nor the futurist promise of the other, but the present and active declaration, "We do"?

No Engine Can Be More Efficient Than Its Cooling System

ACCOMPLISHMENT is only achieved thru the coordination of efficient units.

The great success of Long Cooling Systems in performing their important function of keeping engines of motor cars, trucks and tractors properly cooled is the direct result of scientific coordination.

Exact engineering applies the Long principle of construction in the manner best suited to give the engine the full advantage of highest cooling efficiency.

Long Cooling Systems are now made in more than sixty different designs, adapted to every type of motor vehicle.

In selecting a motor car, truck or tractor equipped with a Long Cooling System, you are assured of continuous productive operation, uninterrupted by radiation troubles.

This Is Buy-a-Car Week

Detroiters, Aloof for Months, Back in the Market; Twentieth Annual D. A. D. A. Show Is Under Way

THE LONG MONTHS of depression which have affected the automotive industry as well as every other line of business enterprise appear to be rapidly approaching an end, and the Twentieth Annual Show of the Detroit Auto Dealers' Association opens today under circumstances auspicious alike for manufacturer, dealer and prospective purchaser.

For the manufacturer and dealer the circumstances are auspicious for they afford opportunity to show the prospective purchaser, who has learned a good deal during the period of extravagance through which he has passed and is not going to invest his money without first knowing that he will receive full value for it, that at today's prices a motor vehicle is a "good buy" and that now is the time to buy.

For the purchaser the circumstances are auspicious because they afford opportunity, now that money is growing easier and he is ready to buy, to make the fullest examination of all the wide range of vehicles, comparing one with another, and finally to decide the make and model which best meets his needs and his purse. He will find each dealer anxious and equipped to go to any length in the way of explanation, to satisfy him. Instead of receiving orders only on Wednesdays and Fridays, with notices that "the line will form to the right," the dealers are hot after business now. It ought to be a most gratifying week for the buyer—and for the dealer as well.

And that is not saying that the dealer has been "up-stage." His trouble during the period of reckless buying, not many months back, was that he could not begin to get enough cars to supply the demand. His customers drove him to distraction demanding deliveries. The prices he asked never were unreasonable. If any industry should be absolved of the charge of having reaped inordinate profits, it is that which manufactures and sells automotive vehicles. But the rain that descends upon the unjust descends as well upon the just. The public, up in arms about prices it had to pay for necessities generally, "passed up" the motor vehicle along with the rest. It has been grouchy toward everybody who had anything to sell.

It is only natural, therefore, that trade in motor cars has been one of the first commercial lines to begin the "comeback." It has been one of the first, if not the first, to respond to the stimulus of improving times. The tide of buying began to swell at the New York show, gained volume at the Chicago exhibit and has been growing stronger as each motor show this year has been held. By contrast with a year ago, buying has been quiet and unpretentious, but it has been nonetheless real and growing. Purchasers are not buying with reckless abandon. They are taking their time about it, exercising discrimination, but buying.

The best evidence is offered by actual sales records. One company manufacturing a high-priced car turned over more business through its Detroit representative in January and February than for the same period any one of the last eight years. The answer of course is that new buyers of cars in this classification came into the market, many of them able for the first time to own machines of a higher order. The records of another well-priced car show more Detroit business since August than at any previous time in six years.

On the other hand we find the Detroit agency of a medium-priced automobile with a sales record of 78 vehicles in February, while orders for another car in the same classification have doubled the monthly production of the factory.

These early buyers belong to that class of people who purchase cars when they need them, who consider the automobile an economic necessity, and reasonably priced today. They have been doing a little figuring and have come to the conclusion that further price-cutting is hardly to be expected. They have not overlooked the fact that "cost of idleness," including deferred dividends and all postponed settlements, will have to be spread out over sales for some time to come. The pendulum has swung too far; the longer the buyer waits before making his legitimate purchases, the longer it will take the industry to regain its equilibrium. Added to that, it is becoming more generally known that the surplus of vehicles on hand is not more than enough to take care of two months of normal consumption. In view of this, the prospect of a shortage in the late spring and early summer is not remote. An era of marked prosperity would absorb the supply in two or three weeks, because of the pent-up demand which exists and the inability of the manufacturers to attain large production immediately. As a matter of fact, it is probable that more cars are being sold now than are being manufactured. In other words, the surplus is being eaten up. If sales get close on the heels of production, or overtake it, we shall see a scramble for cars, for there is nothing which will make the public buy vehicles so quickly as the inability to obtain them after they have been ordered. It is the experience of dealers who have been in the business long enough to have gone through former periods of depression that so long as cars are available and the market is "soft," so to speak, public interest falls off accordingly. On the other hand, if prices begin to rise and deliveries are hard to obtain, ordering becomes brisk. That is just a bit of what the savants term "mass psychology."

The prospective buyer will find a better type of vehicle awaiting his inspection this year, in spite of the fact that the engineering and experimental departments of most of the manufacturers have been on reduced time these last few months. Many improvements which had been developed earlier have been built into the 1921 product. Notable among these is a reduction to a previously unreached minimum of engine vibration, hardly any perceptible difference being noted between the highest and lowest speeds of which the motor is capable. This has been accomplished principally by better balancing of the crankshaft. Speaking more generally, however, the manufacturers, being on a smaller production

Digitized by Google

schedule, have had more time to devote to each vehicle. There has been opportunity for even more careful inspection and test. Thus it has become more a proposition of quality than quantity, a condition accentuated by the fact that it has not been possible to sell "just anything that came off the assembly line," as one automotive engineer recently has expressed it. "The cars which are coming through a good many factories today are more carefully made than those which came through six months ago," he said.

So that the buyer will get a better motor vehicle than ever before, in all cases at a reasonable price, and in many cases at prices considerably lower than a year ago.

Few if any radical departures are to be found in this year's models. There has been refinement of line, but conservatism characterizes nearly every change made. Detroit show visitors are seeing for the first time locally about a dozen new makes of motor cars, among them the Daniels, Handley-Knight, H-C-S, Kessler, LaFayette, Lincoln, Sheridan, Dixie Flyer, Moon, Roamer and Gardner. While some of these makes are not new this season, they have never before been shown at a D. A. D. A. exhibit.

Detroit show facilities this year surpass those of any previous year, both as to size of floor space and as to arrangements for caring for the crowds. Ever since the first show in 1902 this annual exhibition has been more or less of a shuttlecock of fate so far as a roof to shelter it is concerned. Because Detroit never has considered seriously its convention and exhibition building needs, the dealer show in a city known as the "Automotive Capital of the World" has appeared first in one makeshift building and then in another. More than once it has been saved from being utterly homeless by the civic pride of citizens who could and would offer a part of their industrial or commercial floor space.

The 1921 show is no exception to this rule. It opened today as the guest of the United States Tire Company, in the new Morgan & Wright industrial unit in Jefferson avenue, at Bellevue. This building is a show in itself. One of the largest manufacturing blocks in the world, it could easily accommodate two or three Detroit shows.

Thus the automotive show's misfortune is its good fortune in this case. The space allotted to it is 150,000 square feet, all on the one floor. This space provides for the largest show the city has ever had—300 passenger cars, 100 commercial vehicles and 65 exhibitors of accessories. The arrangement, both from the viewpoint of advantageous display and convenience of visitors, is the best so far offered.

Likewise, a one-floor display permits of splendid decorative motif. Manager H. H. Shuart and the show committee of the Detroit Auto Dealers' Association have taken advantage of this opportunity to lay out an ensemble superior to any of their former achievements. The great structure itself radiates power and substantial life. In a sense its temporary guest is its maker, for it is the automobile that has made the tire more than a tube of rubber, and the Morgan & Wright structure is merely another monument to the greatness of motor transportation.

The decorative committee has hung over the entrance a huge welcome sign, and by means of giant reflectors has directed powerful lights upon the sign and the facade of the building. Should there be any question as to the nationality of this show, the phalanx of poles flying the Stars and Stripes will settle the doubt —this show is an American institution.

Architectural thought of the Pompeiian era has been applied to the circular first-floor lobby, further emphasized by the use of mural decorations, boxwood trees in wall niches and cast Greek vases. A canopy in deep blue covers the lofty ceiling area, and suspended therefrom are silk drops decorated with dancing girl silhouettes and fringed with tassels. Divans and lounge chairs furnish convenient resting places.

Within the exhibition hall proper is the suggestion of spring fever, lazy days, long, smooth roads and easy-riding, swift-moving vehicles of an era rightly called "The Age of Transportation." Mellow light is cast over colorful drapery, flowers, palms and potted plants, and brings into bold relief the finished product of the motor industry. Panels of soft, silken materials and huge light shades decorated with dancing girl impressions, tasselled and corded, conceal the otherwise cold ceiling. Seven-foot columns, emerald green, orange striped frieze, a background of blue and coral-colored vases filled with blossomed foliage complete the general decorative scheme. Shadows which so often defy careful inspection of cars through faulty lighting have been eliminated by the arrangement of lights and the placing of cars.

As usual, a city official presided at the opening, delivering a brief address, to which President A. L. Zeckendorf, of the D. A. D. A., responded. From that on until the end of the week, the Twentieth Annual Detroit Automotive Show will unfold its promise to the world's second greatest industry.

It has been said that the motor truck and smaller commercial vehicle do not find their greatest chance of expression in an indoor show; that they are essentially of the road and by the road must be judged. Whether this be true or not, Detroit's annual display of motor vehicles would fall far short of expectations were commercial vehicles withdrawn

Michigan has been a great market for motorized commercial transportation units and will continue to be. Temporarily its market is apathetic merely because all business has been so. Commercial and industrial revival, now apparently so surely under way, will bring the motor vehicle into greater prominence than ever before. One of the best evidences of this is the agitation for store-door deliveries by railroads, which opens a new field for the truck. There is a desire that provision be made in rail rates for a charge for store-door deliveries. This movement has grown out of past experiences with delayed shipments and terminal congestion. Should the railroads decide to include a charge for store-door deliveries, they would immediately become customers for motor trucks, or contractors for truck service furnished by individuals or corporations.

During the last year the truck fleet strength in Michigan has been somewhat diminished because of the building and industrial depression. Building and industry already are on the mend, and with the revival will come demand for heavy duty trucks and light delivery cars. Consequently the commercial vehicle exhibits at this show will give every owner or prospective owner an opportunity to study transportation units of this character and take note of their possibilities. The Ship-by-Truck organization will lend emphasis to truck use by a parade of vehicles of various capacities.

The automotive equipment or accessory exhibit of the 1921 show is more complete than ever in the past, containing as it does commodities ranging from special bodies, California tops and small garages down to spark plugs and cotter pins. There are, as said, 65 exhibitors.

Detroit's first Salon is being held in the Hotel Statler, several makers having taken space for the showing of special jobs. At the Detroit Athletic Club is being shown a series of twelve oil paintings by some of the country's best known artists, each canvass depicting its creator's conception of "The Spirit of Transportation." Exhibited earlier at the New York and Chicago shows, these paintings, prepared under the auspices of the Clark Equipment Company, Buchanan, Mich., drew much attention. It was expected that the prize award on the series would be announced during the week.

This, then, is Transportation Week in Detroit, the city which produces such a host of units of transportation. It is the week in which the public, which long has held aloof because it had worries of its own, goes to market. The cars are in good supply, they are of quality 100 per cent, the prices are right. The buyer is ready to make a sound investment. Why shouldn't everybody be pleased?

List of Exhibitors Will Be Found on Page 40. Index to Advertisers, Page 44.

THREE OF MOTORDOM'S LATEST PRODUCTS

At the left is shown the Sheridan, latest member of the General Motors family. It is one of the cars which is being exhibited in Detroit for the first time, at the Twentieth Annual D. A. D. A. Show. At the right is the Kelsey friction drive automobile, which has elicited much comment since it was announced a short time ago. In the center is the Duesenberg, whose power plant is a "straight" eight-cylinder engine, the cylinders being on a line instead of in the "V" formation common to motors of this type.

What's New in the 1921 Vehicles

Detroit Exhibit Embraces Some Cars and Trucks Recently Brought Out; Refinements Featured

HUNTING for new designs and radical changes in passenger car and commercial vehicle construction continues to be a popular indoor sport although it lacks the thrills of a decade ago. If there is anything new enough to produce a mild case of stimulation it crops out in the annual shows, and it will crop out in the 1921 Detroit Automotive Show. Not all of the few radical departures from conventional design and construction will be in the Detroit show, but the majority of them will be there.

In their Sunday-best in or out of the show, the motor cars of 1921 will show a general improvement in service—accessibility, a movement in car building started by the development of better service attention which immediately revealed the weaknesses in motor and chassis design from the standpoint of repairing and replacements. There will be evidences of changes in the make or type of units, numerous new body styles and improvements in body and hood design.

When the usual legion of prospective buyers get to that point in their research work which is the verge of despair at not finding anything new to discuss enthusiastically, they are likely to bump up against such eye-openers as the new Duesenberg car with eight cylinders all in a row, instead of in the conventional V formation. They may stumble over the Kelsey friction drive car described by engineers as the only successful car of that type ever constructed.

Then there is the departure of the Pierce-Arrow designers from the right-hand to the left-hand drive, and other changes that are more than commonplace. The Guy disc valve motor in the Ace automobile will give them something to think over. C. H. Wills' new car, the Wills Sainte Claire, being manufactured at Marysville, Mich., may not be at the show, but it is something new and is not likely to hide its headlights nor its tail light under a bushel.

At the Detroit show, however, there are 11 cars quite new to local motor car exhibits, if not new to the New York and Chicago shows. They are the Roamer; Daniels; Handley-Knight; H. C. S., a Harry C. Stutz product; Kessler, a Detroit-made car; the LaFayette; Lincoln, Detroit-made and a new creation of H. M. Leland; the Sheridan; Dixie Flyer; Moon and Gardner.

While experimentation is not dead by any means, standardization is casting its influence on the modern motor car with increasing strength. A survey made by Motor Age shows this fact, the average car having these general features:

Wheelbase, 122 inches; motor, six-cylinder, L-head, 3.42-4.97 bore and stroke, 256.35 piston displacement, 26.53 N. A. C. C. horsepower, splash-pressure oiling system with gear pump, pump cooling system, helical timing gears, three-speed transmission, 4.49 gear ratio, semi-floating axle, semi-elliptic rear springs, spiral bevel drive and 32x4 tires. The average price of five and seven-passenger touring cars is given as $2,794 and that of all body types, $3,583.

Only two makers have designed a 12-cylinder car, the Haynes and Packard companies; 11 are manufacturing eight-cylinder models, while 72 are producing six-cylinder, and 47 four-cylinder models.

So far, manufacturers of the eight-cylinder motors have held close to the V-type arrangement, which makes the new Duesenberg straight-line eight-cylinder motor a novelty.

This new motor is the product of years of experimenting by the Duesenberg brothers, designers of racing cars, one of which has broken the world's speed record. In their Elizabeth, N. J., plant they set out to build an every-day car with the flexible features required in a racing car. Besides the single-block, eight-cylinder motor, they have introduced a hydraulically-operated, four-wheel brake system.

All eight cylinders and the top part of the crankcase are cast in a single block, the cylinder head being a separate iron casting

Digitized by Google

and the lower half of the crankcase an aluminum casting. The motor has inclined valves in the head, operated from an overhead camshaft—a type of construction which has been very satisfactory in racing-car design. This design also makes it possible completely to machine the compression chambers, making all of equal volume and giving a full load compression of 80 pounds to the square inch.

The bore is two and seven-eights, with a stroke of five inches, and the overall length of the cylinder block is thirty inches. The piston displacement is 250 cubic inches.

The braking system is particularly interesting. There is a 15-inch brake drum on every wheel, each expanding service brake shoe being controlled by pedal in the customary way, but through an ingenious hydraulic arrangement instead of the conventional linkage. The difficulty with front wheel braking systems has always been that of designing a simple and efficient mechanism for conveying the power to the front wheel brakes.

Duesenberg has surmounted this difficulty by operating them hydraulically. These brakes are foot-actuated, in accordance with regular practice, but the motion of the brake pedal, instead of being transmitted to the brakes by a direct mechanical linkage, is transmitted by columns of oil under pressure. The brakes, which are of the expanding type, are fully enclosed. The brake drums have an effective width of face of 2¼ inches, and are provided with cooling ribs on the outside in accordance with racing practice.

Ever since the motor car became a practical vehicle inventors have been trying to eliminate the gear-shifting process. The effort to devise a friction-drive system has been the most popular. Cars of this character have been put on the market, but their success has been indifferent. Judging from technical reports, the Kelsey car has the first practical friction drive. This car is made by the Kelsey Motor Company, Newark, N. J., and is touted as the only friction-drive car made in America.

The transmission and clutch are located in the rear axle housing. The rear axle is internal gear driven from a straight-line drive shaft. The contact between the wheel and disc is said to be positive and the wheel can be stopped at the center of the disc. High speed is obtained by contact of the wheel with the outer edge of the disc, the speed gradations being obtained by moving the wheel toward the center of the disc.

There is no neutral position. The clutch can be released by the foot brake, or the friction members may be engaged and the brake applied. The wheel is held in its place on the disc by a ratchet, which can be disengaged by a slight pressure of the foot pedal. It is said that this friction device eliminates 123 parts necessary to the ordinary car. Wheel and disc are made of analite, a light, but tough metal, which reduces wear. In other types of friction-drives the complaint was that the disc was rapidly worn down, with the result that the life of the disc and wheel were too short to make the car economical or efficient. In the Kelsey car this has been overcome by the method of applying the wheel to the disc, and the material used in wheel and disc construction.

The Ace, made by the Apex Motor Corporation, Ypsilanti, has a six-cylinder motor with the disc valves in the cylinder heads, operating at one-eighth crankshaft speed. These valves are the shape of a Maltese cross and are keyed to the shaft, as is the driving gear. This car is offered in touring and roadster models.

Briefly, the Wills Sainte Claire is an eight-cylinder, V-type motored car, the cylinders set at an angle of 60 degrees. Valves and camshaft are of overhead construction and driven by spiral bevel gears. The makers have made use of molybdenum, a light steel that has enabled them to build a car weighing 3,000 pounds.

The wheelbase is 121 inches, ball bearings are used throughout and the headlights are magnetically controlled with a rear light to illuminate the back of the car when operating in reverse. Metal disc wheels are standard equipment, with 32x4½ tires. The car embodies 12 basic patents held by Mr. Wills.

While the changes made in well-known makes of cars are comparatively small and belong more to the realm of refinements, yet they will be of much importance to those who are frequently in the market for cars and know what constitutes the best and most valuable in automobile construction.

For instance, the Pierce-Arrow, made in Buffalo by the Pierce-Arrow Motor Car Company, is almost traditional, but its adoption of the left-hand drive will be important, for it is one of the few American makes which had refused to "follow the pack" in this particular. Two years ago the Pierce-Arrow appeared with the dual-valve motor and it is continued, also the dual ignition which provides two firing points and cleans the motor at every explosion.

This dual-valve motor was adopted because it promised greater economy and apparently the company is satisfied with results. This year's models have larger bearing surfaces, more rigid construction, three-speed transmission, an over-running intermediate gear which makes gear-shifting easy, a new type of foot accelerator so placed as to eliminate fatigue and facilitate indefinite control. The chassis is lower and a change in spring suspension has improved riding quality while making a lower body hang. The company has 10 new body models for 1921, all of them made of cast and plate aluminum, eliminating joints and mouldings and furnishing a better surface for painting and finishing.

The Haynes Automobile Company's new Model 50, in a five-passenger touring car and on a 121-inch wheelbase, is an addition to the 1921 ranks. Steel instead of aluminum is used for the body, the wheels are the same size as on other models, but the tires are smaller. The six-cylinder motor is the same as in other models and the magnetic switch, button-controlled, and electric starter are the same. This car puts a Haynes in the $2,000 class.

Columbia has a new model, a five-passenger, permanent top car with disc wheels, larger rear door and a flowmeter which measures the fuel used and gives you the result on a gauge on the dash.

Besides the new light eight-cylinder car, Oldsmobile has a four-cylinder chassis with touring, roadster, coupe and sedan bodies. The eight-cylinder car has a lower suspension, higher rear panel, a 115-inch wheelbase and two water pumps.

Dort has changed the shape of the radiator and increased the wheelbase from 105½ to 108 inches.

The Franklin designers have changed the hood only, largely because they have got the rest of the car so far out of the experimental class for air-cooled cars that there is not much that can be done. It now has a sort of dummy radiator, and a hood that is a near relation of the Italian Fiat, technical writers say. The new hood is interchangeable with the old one.

What was the Crow-Elkhart is now the Elk-Hart, a new car with a Herschell-Spillman motor, disc wheels and a new radiator design.

Air-cooled cars are few and far between. One of the few is the Holmes, appearing this year with a more conventional hood and radiator, and what is more important, a device called an aerodnct, built around the fan in such a manner that it directs the air currents from the fan and doubles the cooling efficiency.

The Romon automatic chassis lubricator, which provides centralized lubrication and displaces grease cups, has been taken up by the Saxon makers. Circulation of oil is obtained by copper piping, both flexible and rigid, which carries the oil under pressure to every part of the motor and chassis.

Apperson engineers have decided to make the head of the old "Jack Rabbit" removable. In other words, the new models have detachable cylinder heads, in no way altering the appearance of the cars.

The spiral bevel gear has replaced the bevel in Maxwell cars, and Lynite pistons and tubular propeller shaft are used, all of which is for easier maintenance.

Digitized by Google

Daniels cars appear with the thoroughbreds at the Detroit show, for the first time, this year. This company is building its own eight-cylinder engine with 12 body styles, including the new submarine speedster and a coupe. The bore and stroke are 3½x5¼.

Among the newcomers at the Show having marked evidences of a desire to increase accessibility is the H. C. S. Grease cups have been eliminated, the ignition head, starting motor and generator are on the right side of the motor, the wheelbase is 120 inches, the motor is a Weidely, four-cylinder, valves-in-the-head unit, with bore and stroke of 3⅜x5½. This car has a Lanchester vibration dampner. Delco three-unit system, aluminum steps instead of a running board, 32x4½ tires and a cellular radiator with German-silver shell are other features. Two extra wheels and tires are furnished.

Handley-Knight builders have their cars in the show. The motor is four cylinders, 4¼x4½ bore and stroke. The clutch is a Borg & Beck, the transmission a Grant-Lees, the oil feed is pressure and the cooling thermo-syphon.

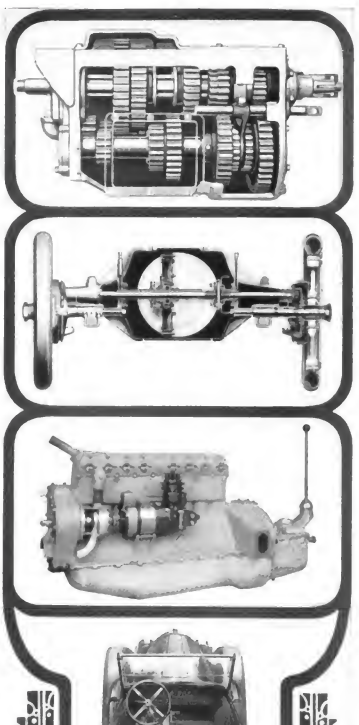
In the Lexington laboratories the Ansted motor has been developed for Lexington cars. It is a six-cylinder, overhead valve type, developing 70 horsepower.

LaFayette cars have a lighter chassis this year, a re-designed frame of lower suspension, and harder cylinder castings in the eight-cylinder, V-type motor. The crankshaft is hollow and the adoption of a brake-equalizing differential on the transmission case eliminates side-skidding.

Another new car in the show is the R. & V. Knight, in six and four-cylinder jobs. These cars have Wagner electric equipment, Brown-Lipe transmissions, Borg & Beck clutch, thermo-syphon cooling and tubular radiators. The large car has 127-inch wheelbase and Timken axles. The smaller one has a 116-inch wheelbase and Salisbury axles. The four-cylinder car is marketed in a five-passenger touring and five-passenger sedan.

Motor trucks for 1921 show little change over 1920. An increased use of pneumatic tires on light trucks and electric starting and lighting equipment are in evidence.

The General Motors Truck Company 1921 line comprises five models, three-quarter, one, two, three and a half and five ton. The smallest car is a new addition.



Solution of the most vexing problem that has confronted motor truck designers since the beginning of the industry is found in the new transmission used on all models above the one-ton. The transmission, accurately named the GMC two-range transmission, provides both speed in direct drive as well as pulling power in the lower gears and does not necessitate the use of an engine of excessive size, making the truck's operation economical.

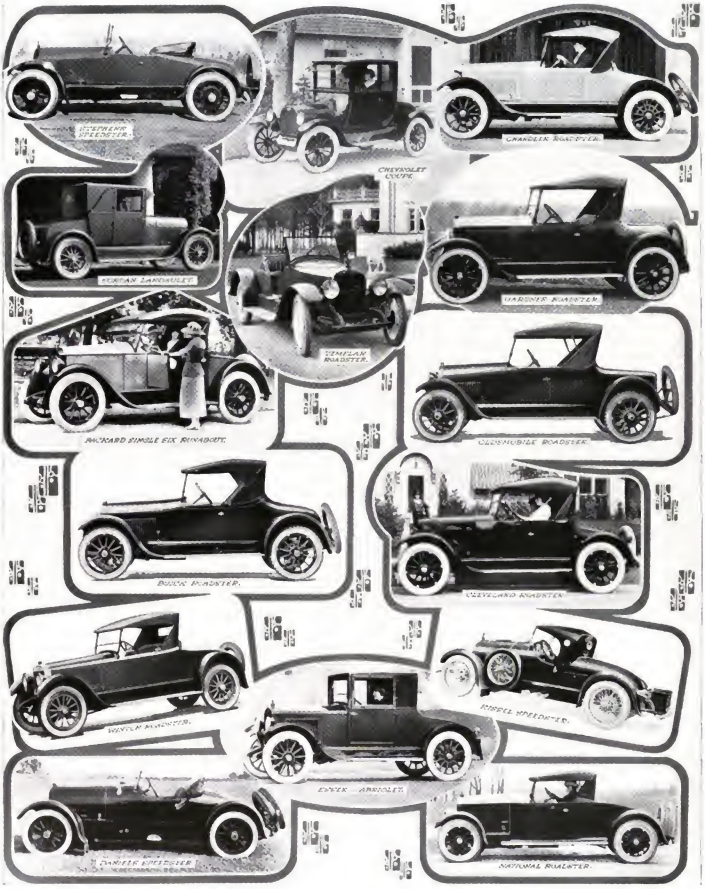
The increase in speed is made possible by the use of a higher geared rear axle than has been used heretofore in GMC trucks; while the requirements of pulling power are furnished by giving the countershaft of the transmission an extra gear reduction.

The transmission countershaft has two sets of constant mesh gears of different ratios, instead of one as in the regular type four-speed motor truck transmission. These sets are controlled by an extra lever, giving the truck two distinct power ranges, each with three speeds forward and a reverse, direct drive remaining the same regardless of the range.

Approximately 50 per cent more speed, in direct drive, has been added by this two-range transmission and at the same time 30 per cent more pulling power has been furnished through the low range of the transmission. And only five major parts are added to those used in a regular type four speed transmission.

The same dual-valve motor in Pierce-Arrow passenger cars is applied to this company's trucks, with such variations as are necessary in a truck engine. The company has found that the dual-valve motor with a bore and stroke of 4½x5 gives 25 per cent more horsepower than the single valve engine, with an increase in mileage per gallon of fuel. Included in the line are three and a half, two and five-ton cars and a tractor unit. The dump body has a horizontal hydraulic hoist with pump mounted on the transmission.

SOME NEW MECHANICAL FEATURES ILLUSTRATED



The drawing at the top shows a sectional view of the new GMC truck two-range transmission. The next drawing is a sectional view showing the mounting of the Kelsey friction wheel, in the new Kelsey friction drive car, on the jackshaft. Note the compact differential and emergency brake drum at the right and the internal gear drive connection with the road wheels. A large filler plug makes replenishing the oil in the reservoir of the internal gear units simple. Below this picture is a photograph of the Duesenberg Straight Eight engine, showing the mounting of the generator and ignition distributor unit with water pump. The engine has the side valve construction, with long vertical rocker arms. It is fitted with valves inclined in the cylinder head operated by an overhead camshaft. At the bottom is an airplane view of the 1921 Pierce-Arrow car, showing the steering gear on the left side, instead of the right, as heretofore.

"How Much Time May I Have?"

Some of the Things the Dealer Has to Think About When You Ask for Credit on a Motor Car Purchase

By PHIL S. HANNA

TO BEGIN WITH, the question of whether an automobile is a necessity or not will be omitted. This, dear reader, will no doubt warm you up to the subject, for, whatever classification given the automobile, each and every one of us who hasn't a car intends to own one some day, irrespective of Federal Reserve Bank edicts, or taxes. This healthy desire, in fact, is one of the strongest elements in the retail credit situation. There is considerable similarity between the craving of a shop girl for a diamond and that of a shop boy for an automobile; and that which is most desired has proved, both in diamond purchases and in the automobile partial payment plan, to be the object quickest and surest paid for.

"Square Deal" Miller will tell you that he is giving back less money now on his proposition to refund 90 per cent of the purchase price of diamonds than he has for several months past, although in many cases the wearers of those same diamonds are going without extra food and clothing. And a large acceptance corporation has given out significant figures regarding its experience with partial payment automobile paper during the last six months. The same tendency to hold on regardless is shown. Eighty per cent of the paper is paid when due, fifteen per cent is paid within thirty days after maturity and four per cent is met within sixty days after due, which leaves a remainder of exactly one per cent on which losses have occurred. And it is further stated that one-half of this one per cent is made up of disputed accounts, which often are adjusted without loss; so that an experience table would show somewhere between one-half of one per cent and one per cent as the usual loss on automobile paper. The concern which gave out these figures set aside $350,000 as a reserve against losses, but the actual losses at the end of the period totaled about $240,000—one-fifth of expectations.

Over in Chicago recently a wholesale grocer bewailed the fact that he was engaged in a so-called staple business, or what might be classified as a necessary industry, and he went on to bemoan his ill-luck at not being in the automobile "game." His expression came as somewhat of a surprise, for Chicago is a city of wide diversity of industry, an enviable transportation center and so on—all necessary and staple lines of business, and the average man who reads the daily reams of business advice and assorted interviews might be expected to wish that he were engaged in driving a milk wagon or running a grocery. But not so with our friend, the grocer. He says precisely: "You people of Detroit are lucky because your main commodity is something that the average man puts ahead of most everything else. Lots of people will go on short rations and wear old clothes rather than give up their cars."

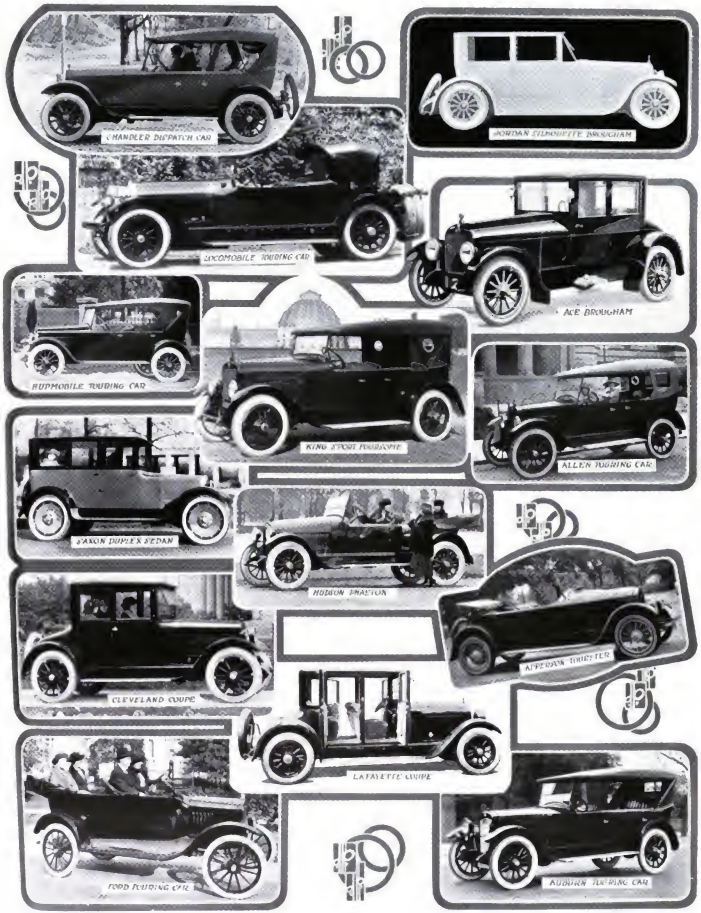
What, therefore, could be a better basis of credit than this persistent willingness to pay in spite of depression and all other drawbacks? In the final judgment of things, value is fixed only by what the other fellow will pay, and where the other fellow insists on having the commodity put up as security, that commodity becomes first-class collateral.

For comparison take a first mortgage on real estate. Beyond all doubt, from the standpoint of safety, a first mortgage, say, for $10,000 on property worth $20,000 and bringing in rents of, say, $2,500 annually, is security good and ample, but in times of depression where there are 10 people with cash means enough to swing the purchase of land worth $20,000, there are perhaps 1,000 people with means enough to buy a used automobile; and consequently, from the standpoint of controvertibility, any given amount of paper secured by automobile property notes, where the purchasers are honest and the loans conservative compared with re-sale values, is much more liquid than a like amount of money secured by mortgages. But, of course, this does not mean that the banks are going to give entire preference to automobile paper. But it may mean, as each class of business bids for the available credit of the country, that other lines of endeavor may have to bid up for their proportionate share.

Competition plays strange pranks as any new business evolves from year to year. Look at the mail order houses, for example. At first nothing was sold but for cash with order; later on it was found expedient to grant credit, and the latest is that retail stores are to be opened by Sears, Roebuck & Company in order that this huge merchandiser may compete with chain stores and otherwise hold on to its customers; and it would not be surprising to find, before many years, a large fleet of Sears-Roebuck retail wagons covering the entire rural United States. Nothing seems to stand still in merchandising and selling methods nowadays. When one new scheme gets nicely under way and begins to return profits that are satisfactory, along comes some ingenious fellow with a checkmating scheme, and to stay in the game it is necessary to invent something still more serviceable in the way of getting business.

Some ten years ago the International Harvester Company gave one and two years to farmers to pay for machinery, but along about 1916 it began to tighten up and extended credit only to the dealer, with a later attempt to require the dealer to finance himself something after the fashion that Ford agents are required to follow. Just how far the change went is not known, but it was clear when money was easy during 1919 and early 1920 that the farmers had little difficulty in financing themselves at their home banks. In fact, much of the load that the country banks are now carrying can be traced back to that easy period when there were lots of deposits and very little farmers' paper got very far from the point of origin.

So far as the automobile manufacturer is concerned, there seems to be little likelihood that he will go into the business of extending credit to purchasers directly. In the first place, the manufacturer is being financed on the rock ribbed foundation principle that his commodity sells for cash and change toward time sale policy would require many millions of capital that he hasn't now and cannot get. Perhaps after a few years, when some of the stronger companies become opulent, there may be a change. In fact there some indications now that the manufacturers may form their own financing companies by which they hope to control rates and encourage sales. The financing companies now in operation, however, have sprung up because neither dealer nor banker has been in position to handle the enormous volume of part payment paper for which the public has demanded a market. There was a breach between manufacturer and ultimate purchaser that needed a new design of financial machine as a connecting link; and in order to keep the manufacturer on a strictly cash basis in his selling policy and to avoid requiring the banks to set up elaborate collection machinery, these finance companies were created.



That the field for their services and endeavors was virgin is demonstrated by the rapid increase the last eighteen months in the number of new concerns of this type. Hardly a city of any size but is now served by some sort of finance company. And the aggregate capital invested is no small amount. Likewise many dealers testify to the efficiency of the collection methods of the better grade acceptance and finance corporations. Many like the arrangement because after the sale has been made the finance company comes into the transaction, in a sense, like an

How Far Should Service Go?

The Dealer's Obligation to the Purchaser And the Purchaser's Obligation to His Car

By F. W. HERSEY

IN THE DAYS before a gasoline engine was strapped to a four-wheeled vehicle—in the days when a man bought a horse—the dealer did not throw in a bottle of colic medicine. He did not guarantee the animal against a broken leg, nor did he promise to keep the horse in good condition. The buyer did not expect it. Selling tickets on a railroad train is selling service, not the whole train. Selling an automobile is selling the train. It is selling transportation, with all the joys and sorrows that go with transportation.

There was a time, and not so many years ago, when the buyer of an automobile (motor car had not been generally adopted as correct then) took a mortgage on the factory that made the car, of if the factory was too far away, he accepted a tentative lease on the nearest machine shop. The man who bought a car did not get it primarily to ride in, but to see if the darn thing would go. He bought it to scare horses, amuse youngsters and wake up the town generally. Also he expected that the shop that made the car (they were shops then, not plants) would help him keep the machinery in order, join him in clinics on the various mechanical ailments that attacked the vehicle, and—well, rebuild the contraption if necessary.

Usually the plant, or if the make of car was of sufficient importance to claim a dealer, the dealer was only too glad to tinker with the automobile because there was a wholesome pleasure in studying the various diseases to which the new kind of vehicle seemed to be heir. Sometimes the buyer not only stayed up nights with the thing, but also chipped in on the cost of treatment, or the funeral services, as the case might be.

These delightful days are over. Men and all the women who buy and drive cars today do not buy them to experiment with. They are completely sold on this mode of at-your-convenience transportation because breakdowns are the exception, not the rule; because they know that for every punctured tire, carbon-mussed spark plug, or battered bearing they will obtain many miles of smooth, unhampered transportation, up hill and down, in fair weather and foul. All cars that can be sold are made that way. The differences existing between various makes of cars which can be used for the basis of criticism as to efficiency are minor.

The prospective buyer who does not believe this will save money by hiring an engineer to pick his car for him and pay the customary fee for expert counsel. There is coming a day when the dealer who, in order to sell a car, has to talk a blue streak about service will come into the market weak and go out with flowers. There are buyers today who, when a salesman dismisses the merits of the car in half a page and talks a book about service, begin to get suspicious of the car. Why arrange for the doctor before the patient has a fever?

Machinery will not run forever. The length of its life depends on the use it is put to, the care that is taken of it and the nature of the machine. The buyer of a motor car, in these days when knowledge of this piece of machinery is gained by using or dodging one, knows that at some time, usually when it is most inconvenient, something will happen to it. It will develop a cough or a limp. But he is confident that whatever the ailment, someone somewhere knows what to give it, or do to it, and at this moment the element of service in its truest aspect begins.

On the other hand, there is a service which begins when the car is designed. We know some service managers, men with technical training, who, if they ever went into the draughting room of a motor car plant with authority to do so, would ruin the plans of some motor car designers. They would view the whole works from the angle of inevitable mechanical service and do a lot of re-designing. This kind of service, "cast integral" with the car, is nothing more than so building the unit that when mechanical service is called for, it can be accomplished with the least inconvenience and disturbance of the rest of the vitals of the car. Simplicity in design is the first principle of this kind of service.

The next step is production service—the production of the car in quantities sufficient to supply the demand; in other words, give somebody what he wants as near when he wants it as possible. The third step is putting the product in the hands of the right kind of a middleman, whether distributor or dealer. The right kind of man is not one who believes selling motor cars is a "pipe" with free joy rides thrown in, but one who takes life and business seriously; who wants to sell because he likes to sell and is out to make money selling transportation.

That kind of a man will maintain a salesroom with some service facilities, but the best service he will render the buyer will begin before the car turns a wheel. He will pick his assistants carefully; he will be courteous by studious effort, if not by nature; he will try to find out what his prospect wants in a car, and fill the need. If the customer is "green," this dealer will spend some time with him so that he will know as much about the general principles of an automobile as his capacity will assimilate and retain.

This dealer will not conduct an exhibition of the various instruments used to save the car from a lingering death, nor will he promise to put the machine together in case the buyer's son takes it apart to see what makes it go. He will not guarantee to mend its broken ribs for nothing if it is kissed by a trolley car, nor provide a new set of wheels if the car skids into a hydrant or climbs a telegraph pole. The dealer is not selling accident or life insurance, but a product complete in every detail, practicable and useful by the best known standards of practice and utility.

Strange as it may seem, there are lots of owners, and a lot of buyers-to-come, who do not or will not enjoy this viewpoint. Therefore, and wherefore, the contention that service is "the monkey knot of motordom." A sailor will tell you that a "monkey knot" is a length of cord or rope of any size, so tied into a knot that there is no apparent beginning, and no end, and its construction in general defies analysis. Yet it is conceived by human brain and executed by human hand.

Service is so conceived and so executed, but the patterns used and the workmanship have differed so radically that much effort has been made to establish a standard for service. However, the standard attempted refers to after-sale service rather than before-sale service. The dealer can safely be trusted to have as nice a show room and salesroom as his capital will permit. Human pride will dictate that if the rigors of competition do not force it. As to courtesy, only natural refinement or business intelligence can regulate that.

The service that constitutes the monkey knot is the after-sale service, or mechanical attentions following unexpected flaw development, accidents,or tinkering by owners whose self-reliance exceeds their mechanical knowledge. When should this service begin; how much should be free; how much should be paid for, and where should free service end? These seem to be the questions pertinent to the subject.

Any dealer worthy of the name and supported by any business experience at all, knows how much free mechanical service he should give and can give and make this business pay. And there are enough of these men to establish and popularize a

Digitized by Google

standard. But in nine cases out of ten the dealer succumbs to some human appeal. Much of the service outside the pale of legitimate assumption of expense is "policy" service. The desire to obtain and hold patronage, to make a sales influence out of every customer often is so strong as to lead the dealer to yield a point here and there, which is contrary to the principle of standard service, but may be good business in the end.

It sounds well to say that man buying a motor car has no more legitimate claim upon the dealer for free service over and above that pledged in the guarantee than he would have upon the store that sold him a suit of clothes. It is true that the buyer of a suit cannot expect the first to replace all buttons or replace the trousers because the coat is still good. But there is the element of price-consciousness in the purchase of an automobile that does not appear in the sale of merchandise of the price classification of a suit of clothes. The buyer of a motor car pays considerable money for it and often expects to get a "bonus" for spending so much in one place. When his expectations exceed the bounds of business reason he is more likely to become a liability than an asset.

In the sale of a motor car there are four parties concerned in the service phase of the transaction—the manufacturer, the salesman, the service manager and the buyer. General service policies—what the manufacturer of the car expects the dealer to do for the purchaser—are usually framed at the factory. In brief, the manufacturer expects the dealer to maintain as good a salesroom as possible, a mechanical department, a stock of parts, and instruct the buyer how to operate the car, if he or she does not know how. The factory agrees to make good parts that develop flaws within a certain time, usually 90 days. The dealer is expected to furnish the parts, make the replacements and look to the factory for his discount.

Service outside of this provision is entirely a concern of the dealer. We make the salesman a party to the service factor, although it is the dealer who finally is responsible. But we mention the salesman prominently for the reason that, as Fred Slader, manager of a service station connected with the branch of a well-known Detroit-made car, says: "The rash promises made direct or by suggestion by salesmen often lead buyers to expect service which the service manager cannot or should not extend."

"The eagerness of salesmen to make sales often leads them to make service promises to prospects which are not legitimate expenses to be borne by the service department," Mr. Slader said. "Either the salesman makes these promises direct, hoping or believing there will be no necessity of making good, or, by adroitly handling the conversation, leaves the impression with the customer. At the time of the negotiations the service department is remote from the scene, and 'out of sight, out of mind' is the salesman's attitude. The salesman may even forget that he made or suggested any promises not easily kept, but the customer does not."

By way of explanation it is mentioned parenthetically that Mr. Slader is connected with a concern manufacturing and marketing a car selling for from $3,000 to $6,000. His station receives and clears approximately 80 cars daily. The charge for service against the sale price of the car averages about $25 per car, but this is not the cost of parts and repairs, but of all the elements entering into service for high class trade. This station has a personnel of nearly 200, including a floor manager in the works department and courtesy man, who receives all visitors, ascertains their wants and sees that they are attended to. The floor manager, besides having general supervision over the works department, is the first court of appeal where disagreements arise, while the general manager is the final court.

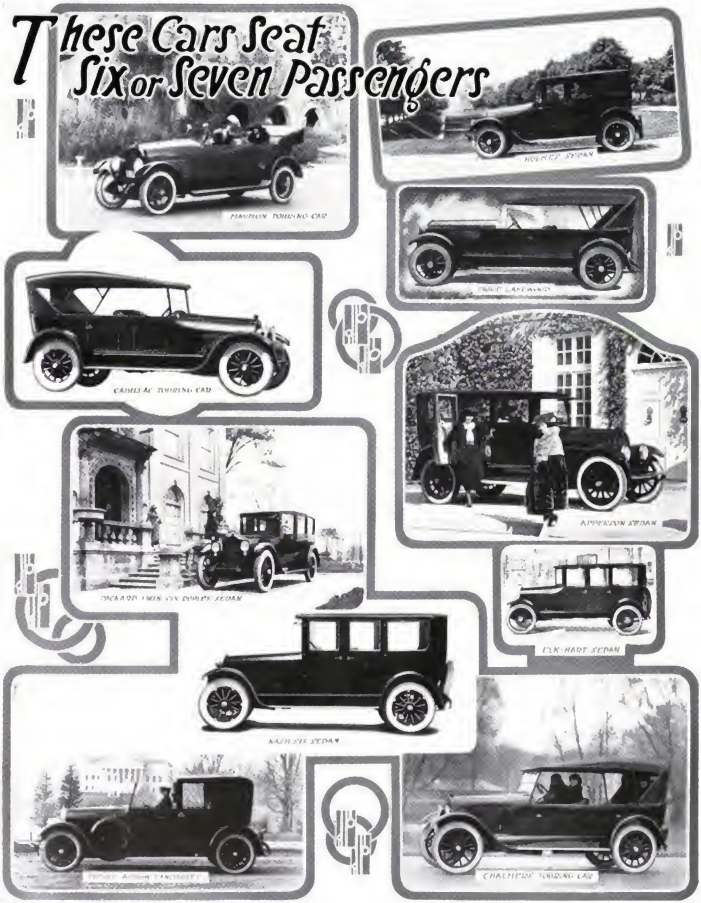
This is service de luxe and costs money, so that the statement that $25 is the charge for service against the sales price of the car is not an insinuation that the car is a questionable product, for it is far from that. Generally speaking, there are two classes of car buyers and they represent the two general classes of service-seekers. Mr. Slader deals with the first class. As a majority they are not price-conscious. They have the money to buy a higher-priced product and are inclined to expect less than many who buy low-priced products.

"My experience with the kind of customers I deal with leads me to say that service is largely an individual matter, and one that is hard to standardize within specified limitations," Mr. Slader said. "The regular fellow does not come in here looking for something for nothing. There are exceptions, but I refer to the majority. The regular fellow and most of the women I have had dealings with will demand that imperfections be made good, which is just and proper, but they rarely try to misrepresent or impose upon us.

"Complaints of poor workmanship, failure to finish a job at the time specified, or other conditions for which we are responsible are bound to arise and are easily settled. But when a buyer comes in here and tries to hold me to some agreement which he claims the salesman made when he sold the car, then I have my work cut out for me. Most of the users of this make of car are business men. When a promise has been made to them they expect it to be kept. Occasionally such a man will hold us to the mark and then we make a 'policy' decision and take the loss. More often, however, if the matter is properly explained the patron will go away satisfied.

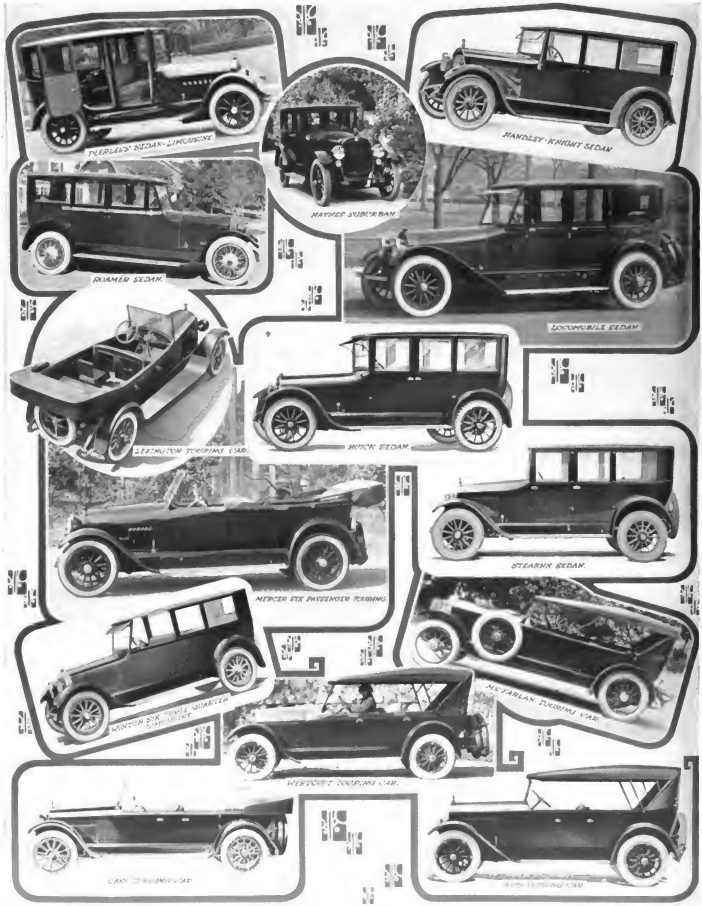
"Really, when all is said and done, the basic principles of service are courteous attention, sympathy and an earnest desire to meet the customer more than half way. More than once, after going over the whole problem with the conviction that the customer was wrong, I have offered to yield a point and then had the customer say 'No, you need not do that. I understand now and there is no reason why you should pay my bills.' The method of approach probably, more than any argument, won the point."

Rendering after-sales service to owners of medium and low-priced cars is much more of a problem than with the higher priced makes. In the latter case you have a different psychology to deal with. In the first place you have price-consciousness as an ever-present factor. You have a larger percentage of buyers only superficially familiar with the motor car as a mechanical unit, and at the same time, more concerned with the upkeep cost of the car. Also there is a larger percentage of persons who will fight for a dollar and use any tactics or subterfuge that come to mind.



The majority of cars are sold on a service agreement which provides for adjustments and at least one inspection for a 30-day period; instructions in the use and care of the cars, and replacement of parts where defects are discovered. While some buyers will accept this agreement at is face value, others will give it interpretations to suit their needs. There is one concern which has established an arbitrary policy, made possible because of the ready demand for the car and its low price. This policy is replacements where factory responsibility is clearly established, the customary 30-day adjustments service, but not a jot or tittle of other service unless paid for.

There are few concerns that have been able to adopt such a policy, even if they wanted to. Most dealers are using the standard service policy as a basis, but extending it upon occasion and under various circumstances. Harry Moock, secretary of the National Automobile Dealers' Association, said in an address in Detroit some time ago: "When 75 per cent of the cars are sold out of the back door, the motor car business will be more of a success than it has so far." Moock had in mind the service station and the sale of service with the car. Moock did not, however, say that the service station was to be sold with the car.



No better illustration of service to the Nth degree could be offered than that of a local dealer who sent a taxicab to a hotel for a customer who could not get his car started because the motor was cold. It was about 2 o'clock in the morning. The dealer was routed out of bed by the customer who wanted something done about his car. The easiest thing the dealer could do

The Average Passenger Car of 1921

A COMPOSITE of the 1921 specifications of 459 body models mounted on 119 chassis as made by 107 manufacturers of passenger cars reveals the extent to which standardization has progressed. The average five- and seven-passenger car of 1921, as shown by this comparison, has a wheelbase of 122 inches; a six cylinder, L-head engine, bore 3.42 inches and stroke of 4.97 inches; piston displacement of 256.35 inches; N. A. C. C. horsepower rating of 26.33, and a splash pressure oiling system with gear pump. The price is $2,794.

Straight Line Design Accentuated

A COMPARISON with the average car of last year and the year preceding shows that radiator heights have increased and cowl heights have decreased, giving an almost horizontal hood line. The straight line design seems to be more pronounced this year than last, and, accordingly, the body line is carried forward to the radiator. The tire size is 32 by 4 inches and wood wheels are used as standard, an optional choice of wire or steel being offered by 18 per cent of the makers.

Selling Truck Satisfaction

Some of Most Successful Manufacturers, Realizing Each Vehicle Must "Fit the Job," Act Accordingly

SALESMANSHIP methods which create as well as supply a demand for any product are considered essential to good merchandising. When the wares are backed by manufacturing and sales policies which include market analysis and customer analysis, the development of any business is marked for success—capital, labor and materials of course being in sufficient quantity. Market analysis gives manufacturer and dealer details of probable demand and character of products in general use, while customer analysis brings into relief the needs and problems of the individual buyer.

Perhaps in the merchandising of the majority of products a well conducted market analysis which considers the buyers en masse rather than individually provides a satisfactory barometer for the control of product character and volume, but there are some which call for customer analysis. One of these products is the commercial motor vehicle. No piece of machinery on the market today is more dependent for success upon the correct gauging of buyers' needs and problems than the commercial vehicle.

Selling motor trucks and delivery wagons is selling the mediums of transportation. There is a fine line between selling vehicles to a company or an individual whose intention it is to sell transportation, and selling vehicles to a company which intends to do its own transportation work, but one set of principles covers both cases. Costs enter into both cases; profits must be reckoned in one case, but may or may not be figured in the other.

In both cases the value of the vehicles sold will be judged by the buyers in accordance with the cost of operation and the performance, but both costs and performance will be satisfactory only when the vehicles sold are properly fitted to the requirements of the business, and properly used. Consequently, successful merchandising of commercial cars presupposes careful gauging of the needs of each buyer, which is customer analysis. Those manufacturers of commercial vehicles who have attained recognition in their field, whose products are most often seen upon the streets and who are able best to withstand the fluctuations of the market, have relied upon market analysis for production control and customer analysis for service efficiency.

During 1919 and the first few months of 1920, for instance, the sale of motor vehicles for industrial and commercial purposes in Wayne county was phenomenal. Then the depression set in and it is estimated that since September more than 3000 trucks have been turned back to dealers, or seized by dealers for non-payment of obligations. Thus the remarkable distribution of trucks became a boomerang upon the motor vehicle industry. While the sudden cessation of every kind of business in which the motor vehicle is used was largely to blame, yet the harum-scarum sale of trucks without any evidence of customer or market analysis played no small part and should not be overlooked.

During the boom period commercial vehicles were sold in many cases for the sake of the commission to the salesmen, for the sake of reporting great business back to the factory sales manager, and in some cases with the honest belief that every sale, regardless of its permanency, was good business and an impetus for the industry. Few dealers had the time or the facilities for making a thorough customer analysis. Too few considered that it was one thing to sell a truck, but another to keep the truck sold, and further, that every turn-back for any reason was one more stumbling block in the path of motor transportation success.

The creative type of salesmanship spoken of in the first paragraph entered strongly into the unwise merchandising of motor trucks in this territory as well as everywhere else in the country. Some of the methods used in selling trucks would invite commendation if the product was not transportation. Instead they were disastrous and every commercial vehicle manufacturer in the country is revising his sales conceptions as a result. Many manufacturers now realize that they were as much in fault as were their dealers, because in the merchandising of the commercial vehicle the builder should not and cannot afford to relinquish control from production to final sale.

Every one of the 300 cars turned back by unsuccessful users is now a used car and can be sold only as such. The buyer lost his money and his faith in motor transportation. The dealer has lost money and the confidence of the customer and his friends. The manufacturer may or may not have lost money, but he has lost some prestige.

Before proceeding with some facts regarding what has proved to be successful merchandising of commercial vehicles, it might be well to mention two or three illustrations of the results of creative salesmanship without customer analysis. These illustrations are taken from the records of the Detroit Transportation Association, and while they may be extremes, they are warning signs.

When F. L. Henk, secretary of the Association, was a clerk in the Michigan Central detective bureau a country boy approached him with a request for a job. The boy explained that he had left his father's farm to seek work in Detroit, and had been unsuccessful in his effort to get a job as engineer or fireman on the railroad. Of course he was not qualified for either, but he did not realize it. He wanted to be a detective, a policeman or a city fireman. Mr. Henk advised the boy to go back to the farm.

Months later when Mr. Henk had become secretary of the D. T. A. the same boy appeared in his office very much in trouble. He said he had been urged to buy a 5-ton motor truck and take hauling contracts, but that he had been unable to make any profit from his jobs, the jobs were hard to get and the dealer who sold him the truck threatened to take the vehicle away from him unless he kept up his payments. He said he had borrowed money from his father to make the first payment but had fallen behind on the subsequent payments. The boy lost the truck.

Illustration No. 2 is the story of a watchman who was persuaded to leave the railroad for the career of a commercial hauler. He bought an $8,000 truck, paid $100 down and gave a string of notes covering a two-year period for the balance. He lasted four months. He knew nothing about the cartage business, did not know how to drive an automobile until taught and had no capital on which to rely.

Illustration No. 3.—A salesman for a truck dealer persuaded a foreigner, who was a successful hardware merchant, to try the inter-city hauling business. The salesman took the merchant over a route touching Mount Clemens, Richmond, Romeo and other inland towns. The prospect was persuaded to buy three trucks. He hired a man to handle the business. There was no business. The roads were almost impassable at times and the merchant milked his business dry trying to support the trucks.

Digitized by Google

He lost two of them and the money paid down, but has managed to hang on to one.

Illustration No. 4.—A moulder earning $1.50 an hour when business was booming was dragged into the commercial hauling business by an ambitious truck salesman, was able to pay two notes, but finally lost the truck.

This list could be trebled in length.

These are a few of the reasons why the truck business in this territory has shrunk 90 per cent. The fight to restore confidence in commercial vehicles has been made exceptionally hard by such sales methods. Misrepresentation of truck costs; selling trucks on the promise of contracts; providing a small contract with every truck sold, and numerous other practices have militated against truck manufacture and sale. Salesmen have knocked down a few dollars and gone their way. Dealers have started out well, but are or will be out of business. Manufacturers have learned a lesson.

Ethics have been conspicuous for their absence in the truck selling business. For instance a Detroit truck dealer has taken an excavation contract under the name of one of its officials and this contract is being sub-let to buyers of the truck sold by this concern. The company may sell a truck or two, but the commercial haulers in the city, contractors and square business men will shun that concern as they would the smallpox. The manufacturer of the truck will be the biggest sufferer.

Aside from the bad practices illustrated, there are the dealers who are square in their sales methods but who have not taken customer analysis seriously or who feel they cannot afford the expense. Some of these dealers wonder why they have complaints from buyers. An investigation would show probably that the buyer did not have the truck best suited to his job. If it is unfair to expect the dealer to assume the expense and labor necessary properly to analyze the customer's truck problem, then the factory should help in this work. Some of the leading manufacturers are doing it.

They assume that the payment of money does not insure the permanent sale of a truck. It merely divides responsibility. Wise manufacturers and dealers endeavor to make salesmen out of truck buyers, and to do that they must successfully solve the buyer's transportation problem.

They cannot do it by selling a one-ton truck for a five-ton job, or a two-ton truck for a three-quarter-ton delivery job. The best kind of creative salesmanship in the motor truck business is that which considers first the job the prospect wants to do and then recommends the truck for that job. It must not be assumed that every prospect knows what he wants or should have, even if he lays down what he considers his specifications. He may be right. He may be wrong. If he is wrong he will not take the blame always.

One of the most successful truck manufacturers in the country, located in Detroit, has based its manufacturing and sales policy upon the principle that good will and future sales are as important as immediate sales; that its trucks are made right and will succeed if used right. It has maintained a corps of transportation engineers who act as analysis men. They not only analyze the market as a whole, but they analyze every customer's problem for him and recommend the type of unit he needs.

Here is an example: A coal dealer in Baltimore believed he needed more trucks. He was besieged by dealers who recommended from three to ten more vehicles. Before buying he appealed to this concern, with which he had had previous dealings. The company sent an engineer to the dealer's coal yard to investigate. After analyzing the problem the engineer recommended that he revise his distribution system and add one trailer. The truck company lost a sale, perhaps, but the coal dealer was so pleased that in addressing a national convention of coal men he told the gathering the whole story. He proved to be a star salesman and the company cashed in on service.

This company and several others operating on much the same scale, though perhaps not so large, spend much money and time on service before sales. Their representatives study the prospect's financial resources, the character of his business and the nature of the materials or work his vehicles are called upon to do or carry.

The distances to be traveled, the character of the roads, facilities for care of the trucks or delivery cars, the prospect's previous experience with commercial transportation, loading and unloading conditions, the economic character of the business he is in or intends to take up, the permanency of it, possible substitute jobs or supplementary work, the revenue likely to be gained and the character of the labor to be utilized in connection with the trucks, all are considered. This is exhaustive analysis, but in possession of this information, the company knows how to proceed and the dealer has some basis for confidence that the product will stay enthusiastically sold.

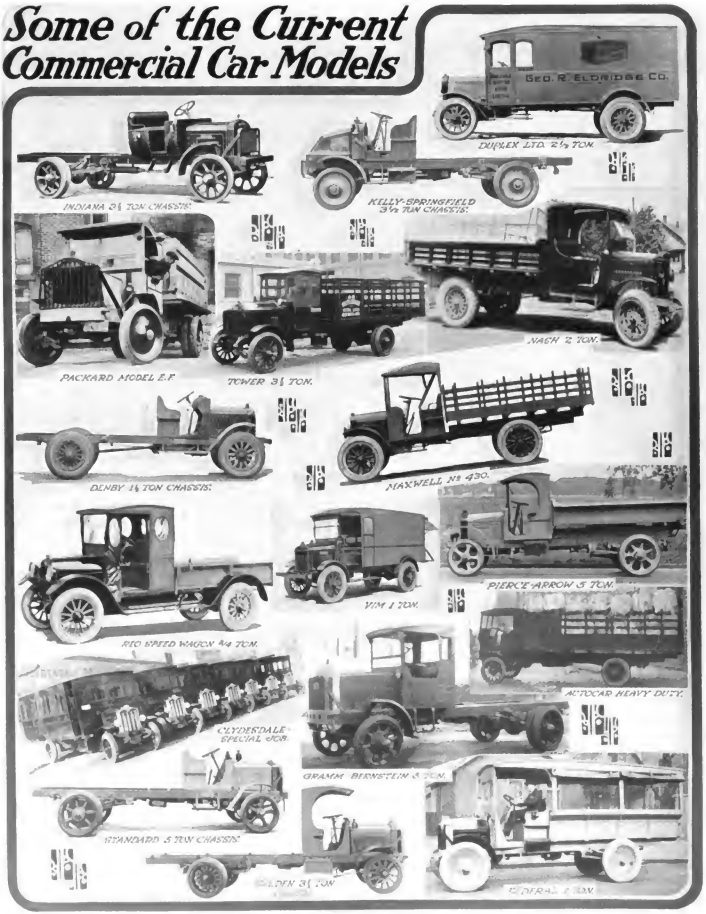
Where the factory does not provide such service, the dealer can approach it to some extent by having, first, a desire to sell the truck for the job and not entirely for the commission; secondly, have on his truck staff at least one man who knows enough about transportation to be able to analyze a prospect's job, and who is willing to study every element that enters into motor truck and delivery car service. A glib tongue, fashionable attire and parlor manners may work well in the sale of passenger cars, but in merchandising trucks, overalls and jumper and a cartage education will sell more trucks and make more friends.

Referring once more to the truck company that has had success commensurate with its policies, this concern has gone so far as to maintain truck drivers' classes in cities and towns where its cars are used in an effort to help the owners get the largest return with the least maintenance cost possible. It has also made up a cost system for all owners of its trucks. It has standardized repair costs on more than 100 operations and is able to supply parts for the oldest truck of its own make in existence.

This is merchandising motor vehicles.

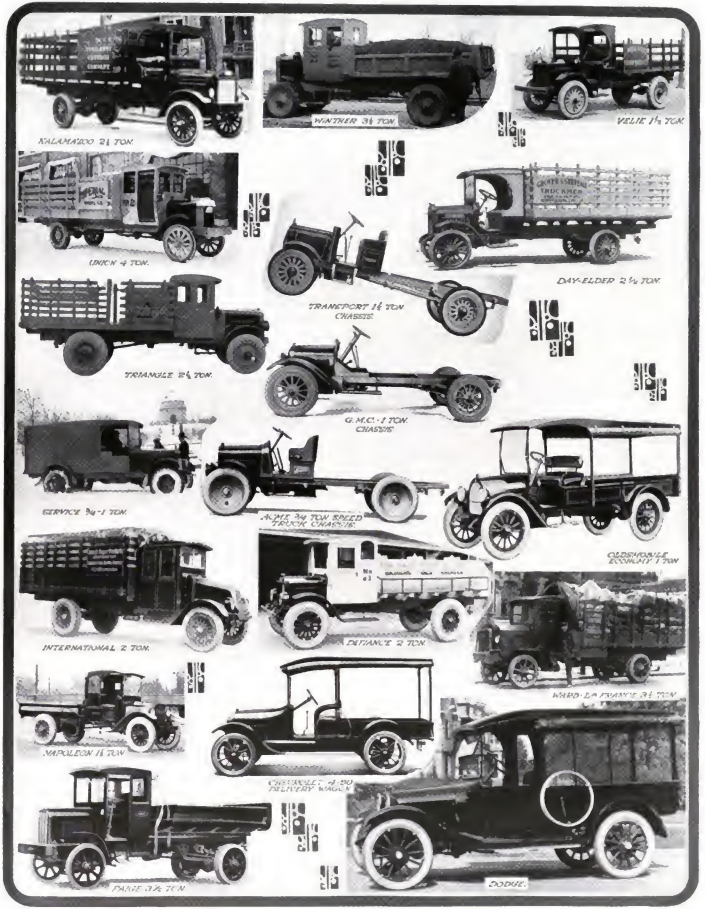
Road Building This Year

More than $1,000,000,000 is now available for highway building and maintenance in the United States. Of this sum, approximately half, or $550,000,000, may be expended during 1921, which would make the coming year the greatest in highway construction in the history of the nation.



Of course, general business conditions will play a big part in the use of the funds now available. Last year on account of the shortage and high price of labor and materials, the lack of open top equipment on the railroads and the condition of the bond market, very little of the money appropriated by the Government and matched by state money raised through bond issues or otherwise was expended. It is expected that all of these conditions will be less stringent in 1921 than they were in 1920, and if this proves correct, 1921 may easily be the banner year in highway construction.

The fate of the proposed Federal Highway Commission to lay out and maintain a system of federal highways has been somewhat complicated by the agitation for a national or federal Bureau of Public Works, but it is almost certain that some forward step will be made in this direction before the end of 1921.



Dealers Would Revive Racing

Members of the New York trade who look back affectionately to the early days of the industry, and the big annual races which furnished so large a part of its history at the time, are advancing proposals to revive something of the kind. The Automobile Dealers' Assn., Inc., has recognized this sentiment to the extent of appointing an executive committee to take charge of a racing program.

Note.—As the reader will at once notice, the accompanying table of commercial vehicle specifications covers only one model of vehicle made by each manufacturer represented. Lack of space precluded a listing of every model. Nor was it found possible to list every producer. Letters were addressed to the representative manufacturers, each of whose products is sold in the Michigan territory, requesting him to furnish complete mechanical data on the model of his truck which has had the largest sale or which he expects to feature during 1921. In cases where the manufacturer did not comply with the request, the figures were obtained from what were considered the most reliable sources. In this case the models were chosen with a view to preserving in the completed table as wide a range of capacity as possible.

43,000 More Trucks Made in 1920 Than in 1919

CONTRARY to expectations resulting from the more or less depressed business situation, 1920 motor truck production not only equalled that of 1919 but exceeded it by 43,000 vehicles. This gives a total 1920 production of 348,000 trucks. Production during the first three quarters of the year held up remarkably well and the gains made over 1919 in the first nine months of 1920 more than offset the lessened production of the last quarter. As to this year, present business conditions do not permit of a prediction of production with any degree of accuracy.

Smaller Models Show Greatest Increase During Year

THE one important factor which enabled the truck makers to increase 1920 production over that of 1919 was the great gain in the number of three-quarter and one-ton vehicles turned out. Whereas in other years trucks of one-ton capacity and under generally totaled from 50 to 60 per cent of the production, approximately 260,000, or 75 per cent of all the commercial vehicles manufactured in 1920, were of one-ton capacity and under. Of course, Ford, with his one-ton truck output of 153,000, dominated the one-ton total, but several others, notably Reo and Olds, made their influence felt.

"How Much Time May I Have?"

(Continued from Page 17)

innocent purchaser and is not influenced in pushing its collections by the same considerations that might move a dealer who usually has something to sell.

On the other hand, some of the manufacturers prefer to have the entire distributing machinery from factory to final consumer under their own control, and the theory advanced by these is that a third party to the transaction tends to tear down the work of the sales organizations. In the case of paper sold to finance companies it is true that the dealer must indorse the paper, but that operates to restrict sales more nearly to those than can pay for cars and it enables the finance companies to obtain a wider market for their securities. Often the paper itself is not sold, but is pledged with a trustee as security for debentures issued against it, the trustee holding the chattel mortgages. But regardless of the form, three-name paper looks good to investors who eventually absorb a large volume of notes given for automobiles, and the extent to which such paper is now negotiated runs into huge figures.

The statement has been made recently that more than half the paper taken by finance companies is by them resold or negotiated through debentures, and one therefore may easily imagine how the car purchasers in this community are obtaining credit far beyond what would be possible by depending on local sources.

One of the Detroit banks has estimated that fully 75 per cent of the car purchase paper now goes to the finance companies. Now there is no way of figuring the aggregate funds so invested, but it is clear that an enormous amount of credit is being absorbed for this purpose. The amount of paper sent East of course adds to the credit supply locally, but the amount of money invested locally in the capital of the finance companies naturally depletes the credit supply of our financial institutions to the extent of such investments, for the money comes out of the home banks. Thus, to the extent that car paper is taken and held by the finance companies locally, the effect is very much the same as if the banks took the paper direct. And the ultimate difference, as stated in the foregoing, is practically one of transferring the collection business to companies especially organized and equipped for that purpose.

A prominent Woodward avenue dealer, who happens to maintain his own financing company, says that the responsible dealer is having little trouble in selling paper given him by desirable car purchasers, but that the down payment has been raised from one-fourth to one-third and much greater inquiry is made into the character of the purchaser and his ability to pay than heretofore. Due to the depression, this dealer estimates that about 20 per cent more sales are made for cash than on time, but he explains that the change has been due more to the fact that the time-payment man has been hit worse than the man who always paid cash than to any other reason.

But a distinction must be made between the financing company managed by careful officers and the one that takes all the paper offered it, regardless. Detroit has been treated to a taste of both kinds and we are now witnessing the elimination process whereby the fit are surviving and the unfit are passing. The head of one of the fit finance companies, located up-state, says that the funds of his stockholders are going to be just as carefully invested as the funds of any good bank, and doubtless his company will survive and will be of service to the community; but if it were not for wasting your time one might relate the inside stories of numerous other finance companies that "listen differently." One of the latter agreed with a Detroit bank to take only conservative paper, but the bank became suspicious and looked into some of the debtors' circumstances, with the result that the bank had to charge up the notes to the company's bank balance, and the arrangement is no more.

The credit situation for the coming six months, so far as the banks are concerned, has another angle. We have been discussing thus far, very largely, the credit supply as furnished by the finance companies and have pointed out that the extent to which they are able to sell their paper outside of Michigan adds in effect to the supply of credit for local car purchases. But the banks in the main are well supplied, and then some, with loans, and at the time of the last published statements had borrowed some $60,000,000 to help Detroit business along. They can not be expected to increase their borrowings at the Federal Reserve Banks, but as present loans are paid they will endeavor to use the funds to cut down their own borrowed money obligations. And any new paper taken on will be looked at from the angle of whether it is eligible for rediscount with the federal banks, for the greater the amount of eligible paper a bank has, the better fortified it is to raise funds in an emergency.

But notes given for purchase for passenger cars are not eligible (unless perhaps the maker is entitled to credit on his property statement) and direct financing by the banks, therefore, may have to wait until the general credit situation rights itself. It should be pointed out that loans to manufacturers of automobiles, and loans to dealers for the purpose of distribution of cars, are eligible for rediscount, provided the statements show the proper ratios; and likewise loans to farmers for tractors or for purchase of cars used in the farming business are eligible, but the Federal Reserve laws and regulations, in effect, say to the passenger car purchaser that he should be financed privately or with the surplus funds of the banks. It will not please the dealer to say that this restriction has been a good thing during the last year or two, but there was much wisdom in the limitation, as the experience of some of the finance companies has demonstrated, and had the extra load of passenger car paper been passed on to the federal banks, the history of the depression of 1920 might have been different.

However, much has been learned by experience with time payment paper, and the good record that careful credit methods have made in this class of money lending perhaps may result in a change before many years that will furnish a wider market for passenger car paper. In the meantime the dealer who can furnish a purchaser who doesn't bite off more than he can chew and can show good character and reasonable ability to pay will get along pretty well in spite of depressions and credit restrictions, and in the end the industry will be better off than it possibly could have been had credit remained as available as pop corn on a Christmas tree.

Coast Dealers Fear "Dumping"

Pacific coast motor truck representatives are alarmed over the prospective effect on their business of the importation of war trucks from Europe and their sale in this country and the suggestion of Congressman Anthony that the War Department be compelled to release between 30,000 and 40,000 trucks it now holds.

Seventy-five trucks imported from Europe were unloaded in Los Angeles recently and similar cargoes are destined for San Francisco, Portland and Seattle. These trucks have been brought here by the Slough Trading Company, of England. Their local representative is quoted as saying that the trucks originally were sold abroad by agents of the American government.

MEN and women, the world over, are irresistibly attracted to the Cadillac, first, last, and most of all, because of its everlasting and unvarying dependability.

That is the determining Cadillac thought —the thought, which is likewise a certainty and a conviction—that there is nothing they can ever ask of the Cadillac which it will not render them.

How Far Should Service Go?

(Continued from Page 21)

was to send a taxicab after the customer and his party. By the time the taxicab got to the hotel the customer had got his car started, so there was nothing wrong with the car. This dealer handles a high class car, but even at the margin he makes he could not render much of that kind of service and stay in business.

C. M. Moller, who manages a service station for a well known medium-priced car, declares that a definite service policy is an easy thing to prepare but a difficult thing to adhere to, because so many unlooked-for conditions confront the service manager. It is possible so to organize the service department that owners are properly received, their needs ascertained and the work laid out. It is possible to establish a uniform policy of courteous treatment, but it is impossible to establish a uniform efficiency standard for labor and hold to it. Labor bulks in the quality of service. The service manager can set out to provide 100 per cent service in repair and adjustment work, but it is the mechanic who does the work. He may be in fine fettle one day and at low ebb the next, with a consequent fluctuation in his quality of work.

"Some owners give us considerable trouble," Mr. Moller said "They imagine they hear a noise in the motor and in they come, all worked up. Often they put considerable importance upon noises which have no significance whatever, but their car must be carefully examined and their fears allayed.

"They do not expect to pay for this service, yet it costs us money. Then we have owners who make demands for free service long after the period allowed has expired. Sometimes they demand it outright, sometimes they will represent that the last time their car was in the station, certain work that should have been done was not attended to, or if given attention, was not properly done. We must then refer to our records to check up on the claims. If we find no record of such orders, then there follows the usual argument. More than once I have discovered that certain claims made for free service were out-and-out attempts to impose upon us. It is all a part of the day's work and we try to keep an even temper and render service to the best of our ability."

N. J. Crone, sales manager of a concern in Detroit which has achieved considerable credit for its success-ful merchandizing of a medium-priced car, considers helping the owner to keep his car out of the service station about the best service that can be rendered. That the owner who brings his car to the station shall get courteous and satis-factory treatment and his money's worth for very dollar spent on mechanical service Mr. Crone considers axiomatical. What the dealer can do for the owner toward keeping him out of trouble and making him self-reliant in minor emergencies, Mr. Crone considers service for which the owner does not pay, but can cash in on.

"True service to motor car owners is not giving something free with the car, nor giving away parts and mechanical labor just to be a good fellow," says Walter Judd. "Service is having facilities for serving the owners of the cars you are selling, giving their needs proper attention and being ready to advise and instruct them in the basic principles of construction and operation. The owner of any make of car should be able to go to a service station where the mechanics and supervisors are experts on that make of car.

"An owner may go to some small alley garage because he understands the prices charged are less than at a regular service station, but he is apt to find that the mechanics put to work on his car know little or nothing about his make of car and the work is largely experimental. This is expensive shopping in the long run.

"Manufacturers of cars are particular about the service station phase of selling because they want the overhanling and repair work on their product done by men who know the product and will not bring undeserved discredit upon it by poor workmanship and indifferent service. For this reason the man who contracts to sell cars must saddle himself with considerable overhead which is only an adjunct to his selling organization, although the most important one. There was a time when a buyer of a car had to wait days and sometimes weeks for certain parts to be shipped from the factory because stock-keeping was not developed to its present high degree.

"Present day service includes having on hand parts for every model car turned out by the concern represented by the dealer. It embodies the facilities for and the willingness to give the best possible service to every owner of that make of car, whether he bought the car of the dealer or not. Efficient salesmen and sales methods sell cars, but it is service that keeps them sold, the quality of the car being up to required standards."

Thus far we have considered only the dealer's side of the service problem. A happy thought led the writer to Capt. W. S. Gilbreath, of the Detroit Automobile Club, in search of a broad view of the owner's side of service. One of the first things Capt. Gilbreath did was to call our attention to a double row of automobiles of many makes and price classifications standing by the curbs of a nearby street.

"See those cars out there?" he asked. "Well, they are being abused. I know that several of them have been there all night. Hundreds of cars owned in this city never enjoy the shelter of a garage. What is the result? Rapid deterioration, of course. Is the maker to blame? Is the dealer to blame? Neither of them are. The blame lies with the user. How much free service has an owner a right to demand? Just as much as his treatment of the car entitles him to, and no more.

"I have been an automobile dealer. I have been a service manager for a retail concern. I have been a traveling service man for a manufacturer, and I have been the owner of several makes of cars. I believe I have some knowledge of the service problem. My conclusion is that no dealer who hopes to stay in business can take care of a car forever and a day because he is selling cars for a living. The human element enters so strongly into service that its standardization on a basis satisfactory to dealer and owner alike is nigh impossible. In this city I believe that the service policies of the majority of dealers are equal to the best in the country and far superior to what I have experienced in many other cities.

"Fortunately there are enough owners of cars who are reasonable and considerate to make selling motor cars profitable, but there are too many owners who seem to labor under the impression that an automobile is indestructible, and if it does go wrong the dealer or the manufacturer is entirely responsible. I dare say that, with few exceptions, the owners who handle their cars carefully have no complaints about the service they get. They cannot complain if they reckon service on the basis of attention to the needs of their cars and not on the basis of how much they can get for nothing.

"In the first place, the factory must turn out a product that will sell and stay sold. In the second place, the dealers try to handle such a product. Factories and dealers together place great stress on service, because no piece of machinery used and abused as the motor car is will last forever, and the object of all their service effort is to get the highest possible efficiency and utility out of the cars for the owners. Ignorance of the character of a motor car leads many owners to make unreasonable demands. The only preventative of this evil is education, and the dealer who strives hardest to educate his customers in the use and care of their cars will get the best results."

20 miles to the gallon of gasoline
12,500 miles to the set of tires
50% slower yearly depreciation
(National Averages)

The FRANKLIN

Why it Continues to Find An Active Market

Franklin sales during December were the biggest for that month in the history of the company. In January, demand ran 15% ahead of production. Sales are continuing at this rate for three good reasons.

First—The Franklin's performance is in accord with the times—it gives results above the average at a cost considerably below the average.

Second—The Franklin, being air-cooled, is just as dependable, just as trouble-free, just as much a pleasure to own in winter as in summer.

Third—The Franklin's price is right.

What we mean by "results above the average" will be shown any time by demonstration. Here is what we mean by "a cost considerably below the average."

The above illustration is reproduced from our catalog. You should have this book. Learn all about Industrial Diamonds. Write for it today.

The Wheels are Turning

The Industrial diamond and diamond tool business of the Wheel Trueing Tool Company is on a consistent up-grade.

This is an indication of two things:

First—that industrial plants are tooling up in preparation for a sizeable manufacturing schedule.

Second—that our policy—maintained unflinchingly through twelve successful years of business—is recognized by the present-day buyer who has the opportunity to pick and choose to secure the best.

The Wheel Trueing Tool Company has proved to the indnstrial world that its diamonds, its tools and its service, guarantee minimum cost per dressing. When the demand was greater than the supply the Wheel Trueing Tool Company, though rushed to capacity, could not possibly meet the demand for its goods.

Now, however, with the resumption of buying, we are not only in a position to take care of all demands promptly, but we are gratified to be able to state, with confidence, that a great portion of the present day industrial diamond business is being awarded to us.

We deeply appreciate the confidence which the industry is placing in our product, our policy and our service.

Can Automobile Body Weight Be Reduced?

BY CHARLES A. HEERGEIST

AUTOMOBILE body building derives its origin from carriage body building, which was highly developed before automobiles were thought of. The phaetons, curricles, cabriolets, landaus, broughams and coaches of two decades ago were at their highest development in style and construction. The quality of timber and all other materials entering into body building, as well as the degree of workmanship, were of the very best that could be produced. This has been proved by examining carriage bodies built 50 and 100 years ago, which are still in good condition. Such bodies as have been mentioned were built to withstand the punishment of bad roads, cobblestones and deep ruts common years ago on country roads. Buggies and two-passenger phaetons derived their lightness, combined with a remarkable carrying capacity, from the quality of timber and the perfect workmanship entering into them.

The landaus were the most troublesome bodies, considered with respect to lightness and carrying capacity, on account of the standing pillars being cut on fence rails. But this very difficulty gave the body builders exact knowledge relative to the dimensions of timber and the size of rocker-plates required to sustain the weight of the body and the six passengers, without a settling of the body on top of the fence rail between the standing pillars.

The introduction of automobile bodies fitted to a metal frame changed body builders' rules and calculations. The supposition was that the metal frame would carry the weight of the passengers and that the body rocker-plates could be dispensed with. This rule seemed to hold good for short metal frames and short wheelbases but, when the wheelbases and frames were lengthened and because of the lightness of the frames, the latter would settle, and with them the body naturally settled, too. On six-passenger closed bodies the standing pillars would bend as a result of the settling of the metal frame, and so would the body sills, carrying the standing pillars with them and, consequently, affecting the opening and closing of doors. In open bodies, the doors would bind on top.

With the lengthening of the metal frames the vertical depth increased and on many chassis this depth has been overdone. A middle course should be found so as to build the body according to the carrying capacity of the metal frame, or the metal frame should be designed in relation to the weight of the body and load which it is intended to support.

Another hindrance to lighter weight is in the introduction of proportional sizes for metal frames so that the same kind of metal frames is used on a two-passenger runabout as on a six-passenger sedan; in the first case the frame is too heavy, or, when fitting a six-passenger sedan body on the frame, it may be too light. In other words, the frame is frequently out of proportion to the weight of the body and passengers.

No doubt the weight of the automobile bodies can be reduced, but the stability of the body on the frame must be retained. If the metal frame sags, as the body is screwed to the metal frame, it carries the body with it at every downward movement; consequently the carrying capacity of the frame should be proportioned to the number and weight of the passengers, and the body built as light as is consistent with stability.

There are some members of body framework which must have certain sizes to provide strong and comfortable seats for the passengers. The width and the height of the body are most important. If the width is unduly restricted the passengers will be uncomfortable, and the body must be high enough to afford ample headroom. Both width and height add to the weight. This also applies to what is known in practice as the "knee room," which affects the length of body and adds considerably to the weight. The door and standing pillars must have a certain thickness when the windows move up and down, and a certain thickness to frame the doors and hold the door hinges and locks in their places.

If concealed door hinges are used, a certain thickness is required which cannot be overcome, and the same consideration applies to the dropping and raising of the window glasses. This holds good with all glasses that move in any direction. The sills on a body should not be less than 1½ inches in thickness and the width across must always be such that both sills rest on the frame. The top rails, cross-bars and curves must have a certain size below which the weight cannot be reduced. As for the covering of the framework, aluminum is generally used, because it is the lightest of metals, easily applied to any curved surface and readily worked. Plywood, another very light material, is used also.

According to the above observations it is seen that the weight of bodies can be reduced if the metal frame is designed so as to support the weight of the passengers and the body. The dead-weight also can be reduced if the frame is built in proportion to the amount of weight carried, the number of passengers and the style of bodies being considered. But in the construction of closed bodies, as in sedans, coaches and broughams, very little weight can be saved if stability, durability and lasting quality are to be retained.

Wills Sainte Claire Price $3,500

Formal disclosure of the Wills Sainte Claire car by distributors automatically released the statement that the price of the car has been set at $3,500 f. o. b. Marysville, Mich. When the car was first described the statement was made that its price would be not less than $3,000 and not more than $3,500. The check on preliminary estimates, made after production routine was established, indicated the upper limit. The car is sold fully equipped, including five tires.

Test the Brakes Daily

Brakes should be tested each day. Before going half a block from the garage, make a service test by throwing out the clutch and applying the brakes. If possible, select a dry spot for making this service test. Under no circumstances should the car be taken farther if the brakes are not operating properly. Drive back to the garage and see that the faults are corrected before driving out again. Automobile brakes have a definite relation to safety.

A Ruling on Car Confiscation

Federal Judge Sessions in a decision in Grand Rapids has ruled that the United States had no right to confiscate an automobile used in liquor transportation where the owner is innocent of the knowledge of the wrongful use of the car.

The verdict was in the case of Stevens Bros., Buick dealers, seeking recovery of a car which was confiscated when Arthur Volets was arrested charged with boot-legging and a small quantity of whisky was found in his car.

Volets was buying the car from the Stevens concern on installments and the latter contended that his action was without their knowledge or consent and, as they were the owners of the car, the officers had no right to confiscate and sell it at auction.

Judge Sessions ruled with the dealers and the car which had been released to them on bond pending the trial was turned over to them and the bond discharged.

Trying to Get the Other 25 Per Cent

THE average automobile engine burns less than 75 per cent of the fuel entering the cylinders, says Motor Age. This is not only due to the fact that it is running throttled nearly all of the time, but because of the fact that the problem of really burning the fuel in the cylinders has not as yet been solved. This question of fuel economy, which was considered at the recent annual meeting of the Society of Automotive Engineers, is of primary importance. The attention of the most capable engineers in the country is now being directed to this problem and it is expected that important advances will be made toward the ultimate solution of the problem and the determination of a method of attack which will tend greatly to conserve the supply of fuel in this country.

It has been pointed out in connection with this waste of fuel that it is just as bad as if 25 out of each 100 gallons poured into the tank were allowed to leak, and, in fact, it is more harmful than if it is lost, for it results in a great many engine troubles, due to the dilution of the lubricating oil in the crankcase and the washing away of the lubricant on the cylinder walls, allowing greatly accelerated piston and cylinder wear.

As pointed out by A. L. Nelson, chief engineer of the Premier Motor Corporation, in discussing this subject at the meeting, it is possible by concentrated study on this problem to get some real results. The amount of power required to keep a car in motion at moderate speeds is very low and, consequently, the engine is required to operate at a very light throttle opening, once this speed is reached. Naturally, poor fuel economy is going to result because this is the most disadvantageous condition under which the engine is required to operate for economy. Mr. Nelson showed how economy and performance can be greatly increased by increasing the compression ratio, this being made feasible by very late closing of the inlet valve. The effect of gear ratio on economy is also brought out in a paper and some new designs of piston and inlet manifolds were described.

C. P. Grimes, development engineer of the Root & Van Dervoort Company, in discussing this subject, stated that he had recently made a number of tests which showed that greater economy resulted from carrying a much greater spark advance than is commonly employed under part throttled conditions. This economy can be gained by a method of interconnection between the throttle and spark advance mechanism when the latter is automatic, as it then must be set properly to function at full load when at the same speed and part load a greater advance can be used to advantage.

Just to show how inefficient the average car is, the Bureau of Mines has made a number of tests on cars selected at random for the purpose of determining the percentage of unburned products in the exhaust. These cars were selected at random and tested under normal operating conditions in precisely the same state of adjustment, or lack of adjustment, in which they run in normal use. This report showed that the exhaust contained only 9 per cent of carbon dioxide; that is, completely burned carbon, while the average percentage of carbon monoxide; that is, carbon only partly burned, was seven. The unburned hydrogen and hydrocarbons in the exhaust, which represent real fuel value, was more than 3 per cent. Not a single car was found in which more than 95 per cent of the fuel was burned, and the average percentage was under 75.

The thermostatic device designed for air temperature regulation and used on the buses of the Fifth Avenue Coach Company, New York, has made it possible to make an average saving of about 8 per cent in fuel. With this device, when it is considered that the company uses several million gallons of gasoline a year, the fuel bill has been greatly reduced.

While most of the papers presented at the S. A. E. meeting were highly theoretical in nature and not of direct interest to the user, they nevertheless are going to have an effect which will become a vital factor in his business as time goes on. For instance, Dr. Dickinson, of the Bureau of Standards, has been doing some research work on fuel which included some studies of conditions known to aggravate the tendency of an engine knock. In order to prove that the knock was due after all to an aggravated piston slap, a piston with excessive clearance was tried, and it was found possible readily to distinguish between the knock due to combustion phenomena and that due to piston slap.

Other tests involved the use of one or two spark plugs used separately or together, and it was found possible to bring about conditions in which firing from one plug would cause a knock, while firing from two plugs would not do so, and vice versa. The reason for this is not yet apparent, but it is thought possible that the knock can be controlled by accurate timing of the center of the explosion. It has been noted that pressures in excess of 1000 pounds per square inch may result from the knock and that the latter is invariably accompanied by a sudden rise in water temperature.

To Finance Truck Buyers

As a solution of the financing problem of the motor truck manufacturers on which David Thomas, general manager of the Motor Truck Manufacturers Association, has been working for some time, the Manufacturers' Trust, a $10,000,000 finance company, has been organized in Chicago with Col. C. R. Vincent, of the Vincent Trust, as president. Although the company has been formed largely through the instrumentality of Mr. Thomas as general manager of the association, his aim being to obtain "methods of financing those having to do with the motor truck business that would be sound and flexible enough to meet all the requirements of the motor truck manufacturer who is conducting his business on a sound safe basis" it is in no way connected with the Motor Truck Manufacturers Association itself. It is expected, however, that the members of the truck association will be given preference since the number of manufacturers that may obtain stock will of necessity be limited.

The methods by which the Manufacturers' Trust hopes to attain its purpose of meeting the reasonable financial requirements of the motor truck business from the manufacturer to the user are co-operative, but the amount of stock the manufacturer may purchase has been limited to $15,000 or 1,500 shares of a par value of $10. This has been due to the feeling that the manufacturer can well use his money in the manufacturing end of his business and that to require him to place a large amount in a finance company to finance his time sales would be like requiring him to "raise himself by his own boot straps."

1921 Truck Engines More Accessible

Greater accessibility and better balance have been the two outstanding features in the design of the 1921 motor truck engines. The trends toward detachable heads and some form of hot spot manifold for better vaporization of the incoming gases have been continued.

The detachable engine head is one characteristic of design which makes for greater accessibility in that the insides of the cylinders and the valve chambers may be easily examined without removing the cylinder blocks from the engine bed.

Another accessible feature included in one of the models of truck engines is a push rod assembly which may be removed in less than two minutes without the necessity of removing the cylinder from its base.

Mixing Politics and Commerce

Process Has Brought Small Satisfaction as Concerns U. S. and South America; Representation Inadequate

By SID A. ERWIN

Member of Detroit Board of Commerce

IN VIEW of the exchange situation and the general unsettled conditions throughout the world, any discussion of foreign trade seems as futile as whistling up a wind. Such reports of trade conditions as drift into the United States Bureau of Foreign and Domestic Commerce are far from satisfactory, and it is not unnatural that manufacturers should give little attention to the sale of their products abroad. Foreign trade never has been a popular subject with many Michigan industrial heads. The home market has been sufficiently large and steady to hold their entire interest. However, such is not the case now and it is not unlikely that the revival of domestic business on a new normal scale not quite large enough to require all present manufacturing facilities will develop a new and absorbing interest in foreign commerce.

While foreign trade is not a new subject to the average manufacturer, one gets the impression from the great amount of literature on this theme that selling goods in foreign countries is a problem of moment. Few manufacturers really understand, while other countries are so well drilled in it that the commercial progress of the United States is seriously threatened.

Admitting an element of truth in this assertion, is it not possible that some manufacturers in our own state know enough about foreign trade to be thoroughly disgusted and disheartened over the risks involved and the apparent imperfection of the government machinery for its promotion? After a sojourn in Central America, the northern part of South America and Cuba and Jamaica, I am inclined to think so. I cannot speak for Europe, Asia or any of the other countries, but I have learned some things about trade conditions in Central and South America which may be of interest.

Idle Ships and Congested Docks

While my trip was for pleasure largely, I started out with the desire to learn as much as possible about trade conditions as they affected my own country. To further this ambition I obtained credentials from a Detroit newspaper and, as a newspaper man, made such inquiries as time and opportunity permitted.

Before I left this country the low ebb of foreign trade movement stared me in the face. Out of New Orleans I saw hundreds of ships lying idle in the harbor for want of cargoes. Inquiries among shipmasters led me to believe they were ready to carry goods at ballast prices if they could get the cargoes.

Arriving in the harbor at Havana, Cuba, I saw more ships, a great fleet of them, the majority of them flying the American flag. They were loaded, but could not discharge because there was no dockage available. On the docks and in storehouses there were boxes, barrels, bales, crates and bags piled up. Most of these goods were from American sources. There were many reasons why they had not been moved. Lack of money to pay for them, the exchange situation, disputes over character or quality of the goods, or terms of sale were among the reasons. What struck me more forcibly than anything else was the absence of manufacturers' representatives and the apparent indifference towards the condition and ultimate fate of these products.

It was estimated that between $40,000,000 and $50,000,000 worth of American goods were stored in warehouses and on the docks. When I inquired if there were any representatives of the shippers in Cuba endeavoring to move the goods I was told that no effort had been made to do so and that there were no American representatives of the shippers in the country. The consular agents were indifferent and it was very plain that the buyers were not at all pleased with the situation. The drop in sugar and tobacco prices stopped buying and resulted in refusals to accept shipments of all kinds of commodities from the United States. While there was plenty of money the planters and business interests in Cuba were holding on to it.

If this Cuban situation is characteristic of general foreign trade conditions then American manufacturers are making a serious mistake in not having sufficient, competent personal representation in foreign markets. Energetic American agents of these exporting companies could move these goods. Conversations I had with Cuban buyers indicated this strongly. In one instance I proved it. I came across a cargoload of eggs shipped from Omaha by ferry from Key West to Havana. There was some dispute over the price, but as all bargaining had been done by letter, no satisfactory results had been attained. I wired the shippers for permission to act as their agent, explaining that unless something was done to dispose of the eggs they would remain where they were until they rotted.

Receiving permission to dispose of them I immediately opened negotiations and turned the entire carload, with the exception of 168 cases that were unfit for sale, over to the consignees. The shippers lost some money on the shipment, but nowhere near as much as they would have lost if I had not taken the case up.

I recognize that the heavy lightering charges from ship to dock are a serious obstacle to profitable trade with Cuba. It costs more to lighter goods from ship to dock than it does to ship from New Orleans or New York to Havana, but the fallacy of trying to sell goods in any foreign country without adequate American representation on the spot is a greater obstacle. Cuban buyers prefer American goods to those from any other country, but if their complaints to me are well founded, they are far from pleased with the selling service rendered. Compared to what buyers get from English, French, Spanish traders in the way of service, American manufacturers fall far short of what is demanded.

Dependence upon government trade representatives or upon native agents has been productive of much grief. The stories I heard during my travels convinced me that our trade representatives, consuls and trade commissioners, with exceptions of course, have been attending more assiduously to playing administration politics than they have to promoting American trade.

An Interview With Gomez

In fact, I believe the charge that under the recent administration the State Department's political activities hampered the work of the Department of Commerce is well founded. When I landed in Havana the U. S. S. Minnesota lay at anchor in the harbor and General Crowder was in Havana ostensibly to pave the way for the lifting of the moratorium. At that time the presidential election returns were being canvassed and former President Jose Miguel Gomez claimed to have been elected, although through a coalition between Zayes and Menocal, Zayes was declared the successful candidate. Soon after Secretary of State Colby left for his South American trip, Assistant Secretary of State Norman K. Davis sent General Crowder and the U. S. S. Minnesota to Cuba.

It was rumored on the island that the presence of General Crowder and the Minnesota had a political significance. If so, neither the man nor the ship affected the election results. I had an hour's interview with Gomez during which he told me that his re-election to the presidency meant much to him and certain American interests. He mentioned, among other things, that he had made Mr. Davis a high executive official in the Trust Company of Cuba, a $10,000,000 corporation, and he expected Mr. Davis to aid him in his campaign in every way possible.

The nature of the rumors and the character of the political talk left the impression with me that it would be easy to create a resentment against any country by too much political activity, and that this resentment would more or less affect trade relations. It occurs to me that manufacturers who wish to establish profitable commercial relations with any country can accomplish a lot of good by urging a divorcement of State Department activities from those of the Department of Commerce. While there may exist a distant relationship between the two, the more distant it is the better. Where the relationship is too marked

Digitized by Google

the temptation to use trade agents for political activities becomes too strong and trade promotion is bound to suffer.

When I was sailing out of Hanava I counted 128 ships, most of them flying the American flag. I was told that some of these ships had been waiting weeks for a chance to unload their cargoes, but that the congestion on the docks and in warehouses because of the enormous quantity of goods undelivered for one reason or another had prevented. In the meantime other countries were going to great lengths to establish their own trade relations on a firmer basis. They were making concessions right and left. They were not complaining about losses, but cheerfully accepting them with the conviction that losses now would be more than offset by profits of the future.

Proceeding on my journey to Costa Rica, the Canal zone, Columbia and Venezuela, I found much the same conditions as existed in Cuba. The feeling against the United States was far from cordial. Politics on one hand and exploitation by adventurers traveling under American protection on the other have caused our Central and South American neighbors to lose faith in us. The people of these countries do not like the character of some of the trade methods by which they have been victimized. The legitimate American shipper is suffering for the sins of others. The only remedy is better government supervision of foreign trade and more competent trade representatives.

The exchange situation in the Canal Zone, Columbia, Costa Rica and Venezuela is bad. The rate of exchange runs from 7 to 24 pesos to the American dollar, or from 7 to 24 of their dollars to one American dollar. This condition, combined with the depression in business and political unrest, has resulted in an accumulation of a great quantity of American goods at every port of entry. The absence of competent trade representatives and personal agents of American shippers is making the situation more acute. There never has been a time when honest, capable American trade agents were so needed in these countries. Other countries are well represented and they are meeting with considerable success as a result.

Land-Grabbing Resented

Panama has developed a feeling of bitterness against Americans because of meddling-grabbing without the diplomatic formalities prescribed by the Hay-Varilla treaty. The Government wanted some territory at Cristobel-Colon for military purposes and the purchase was consummated without diplomatic overtures. President Porraz told me that this kind of policy on the part of the American government was resented, but he professed the utmost friendship for the American people. Anti-American feeling had been increased, he said, by the fear that the United States government would seize the island of Taboga, in Panama Bay.

This island is a wonderfully fertile spot and highly valued by the people of Panama. It has no value for military purposes, but evidently some interest is beginning to rest upon possession of it. In December, 1920, General Pershing was in the Canal Zone. He was invited to dine with President Porraz, of Panama. Pershing crossed the Canal from Cristobel-Colon City and put up at the Tivoli hotel. When he left the hotel with his staff to keep the dinner appointment his car was surrounded by more than 1,000 natives who hurled imprecations at him. His chauffeur and members of his staff were were beaten and the general was saved from violence only by the intervention of the police and United States cavalry. The natives believed Pershing was there to take the island of Taboga away from them.

The former administration tried to buy land in Costa Rica for a recreation ground for American soldiers, sailors, marines and civilian employes in Panama and the Canal Zone, but the Costa Rican government blocked the move by passing legislation prohibiting the sale of land to the government. These are political incidents, but they are important for they show what consular and diplomatic forces have been doing. It is patent to me that the majority of them have been political agents sent into this territory, not to further trade relations, but to play politics on a peanut scale, the effect of which has been to estrange rather than cement the Americans in trade and amicable relationship.

In marked contrast to this kind of consular and trade service there is the European commercial service, well organized, efficient, well paid and so departmentalized that the diplomatic and trade promotion divisions do not cross wires. The difference between the treatment accorded traveling Americans by our consular agents and that tendered Europeans by their foreign representatives is most marked. They are more courteous and more accommodating. They are constantly on the alert to create good feeling for their own industrial and commercial interests. The are equally quick to take advantage of the slightest blunder of the American agents. It seems to me we have too many foreign agents making mistakes, but are singularly lacking in representatives competent to further the interchange done.

Trade commissioners and consular agents of other countries are encouraged to give their best efforts, not only by the remuneration they receive, but also by the concessions in prices, in exchange rates, in packing and manufacturing methods followed by the industrial and commercial organizations back home. They go great lengths to please, even though the concessions made are not based upon the soundest economical principles. We seem to have been selling on the absurd principle of take it or leave it, but pay for it. We have been view-

(*Continued on Page 36*)

Those Federal Reserve Profits

By PHIL S. HANNA

WHEN it was reported that the Chicago Federal Reserve Bank made gross profits of 195 per cent for 1920 there were plenty of critics who jumped to the conclusion that business was suffering under an unnecessary expense. Others thought that the member banks should receive larger dividends, and still others figured that the Reserve Banks should begin payment of interest on accounts. But few of the critics remember that back in 1916 and 1917 some of the Reserve Banks did so little discount business that they scarcely made expenses. The forget that the great bulk of discounting done by the Reserve Banks the last two years has been emergency business and the profits therefrom have been emergency profits. The main function of a Federal Reserve Bank is to hold reserves that are actual and liquid, and it is well known that there isn't a great deal of profit in running a bank where at least 40 per cent of the deposits must be kept in available gold.

The framers of the Reserve Bank act so created the system that an absence of liability to pay interest on deposits of the member banks would offset the lack of earning because of carrying large non-profit bearing reserves. With business functioning normally the Federal Reserve Bank's discount and open loans activities become secondary and of minor importance, but the discount and money issue feature is not service which the Reserve Banks can exercise alone. When the members begin to ask for currency in exchange for notes, the Reserve Banks have to borrow government money and for the use of currency so obtained the act requires the banks to pay over to the Government a certain part of net earnings.

During 1920 the Chicago Reserve Bank paid the Government $10,294,480. As a tax for the use of government currency averaging $531,074,275—which is less than 2 per cent. Had the law set a tax of even 5 per cent per annum on the average circulation, the tax resulting would have exceeded the entire profits of the Chicago bank.

During a pestilence or other calamity it is manifest that the doctors and undertakers are apt to enjoy abnormal incomes, and reversely, during years of low mortality an insurance company must build up sufficient reserves to care for losses during higher mortality years. As a result of 100 years experience we have the American Experience Table which tells closely what the average death rate will be. In the case of the Federal Reserve Banks there was no guide corresponding to the insurance experience to take us by and it was little expected that right off the bat there would come a peak demand for the discount, loaning and circulation services of the Reserve Banks. But the load came and during 1919 and 1920 profits naturally were large.

Now there is first an unwholesome conception of where these profits have gone. For the benefit of the layman it may be pointed out that the first profits above expenses go to pay a 6 per cent dividend to the member banks on the amount of their paid-in capital stock. Then the Government comes in for the entire remainder, except 10 per cent, which is carried to surplus until surplus equals 100 per cent of subscribed capital. This means, briefly, that after the stockholders receive 6 per cent and surplus fund is built up to an ample margin, the surplus gains of the system go right back to the people. The Government is obliged to use the profits turned over to it either by building up the gold reserves against United States notes or reducing the outstanding United States bonds. Inasmuch as the reserve against United States notes is ample, the latter is the more likely disposition of the funds.

Therefore, within a few years when the surplus accounts have all been built up to statutory limit, 90 per cent of the profits of the banks above the 6 per cent dividend to the member banks probably will be used in buying up outstanding government bonds and the people will be saved an equal amount of taxes thereby.

Taking the Chicago bank as an example, net earnings above expenses were $25,875,749. The 6 per cent dividend consumed $732,769; surplus received, $14,688,499, and the Government got $10,394,480. Had surplus account been previously built up, the Government would have received about $22,000,000.

There arises a feeling of security from the fact that so many of the Reserve Banks have built up comfortable surpluses. All the districts except Dallas show surplus equal to subscribed capital, or twice the paid-in capital. On March 4 combined capital and surplus of the 12 banks was $202,361,000, and, should occasion demand, an additional $100,865,000 (balance of subscribed capital) would be available.

But after all, why criticise? It is pitiable that we can't let well enough alone in this wonderful U. S. A. In trying to achieve 100 per cent perfection we may refine the mechanism so minutely that it won't work at all. The fact is, the country has a "good thing" and many people do not know it, including some well-intentioned statesmen.

A Motor Show to Be Proud Of

1921 D. A. D. A. Exhibit Largest, Most Attractive City Has Seen; Attendance Excels; Sales Encourage

By MARC BRAUN

WITHOUT a doubt, the Twentieth Annual Automotive Show of the Detroit Auto Dealers' Association, which opened in the new Morgan & Wright manufacturing unit, at Jefferson and Bellevue avenues, last Saturday evening, and will close this evening, is the most attractive exhibit ever staged in Detroit. Also it is the largest in number of exhibitors, and early in the week gave promise of exceeding the Association's fondest hopes in the way of attendance. Whether from the standpoint of business done it will break records cannot be foretold at this writing, for this is Tuesday and whatever the dealers and salesmen may say now cannot be accurate. However, sales started well Saturday night, 62 cars having passed into the hands of users, and reports for Sunday and Monday were even more encouraging.

Attendance marks for 1920 were passed easily Saturday, Sunday and Monday. The total for the opening evening was 8,079 paid admissions, as against 6,321 for 1920; for Sunday, 10,217, as compared with 7,533, and on Monday, 9,183, as against 8,177 last year. The crowd got out early Monday morning more than 6,000 persons passing through the turnstiles between 10 o'clock and noon. Monday night the booths were jammed, and reports of dealers to the show management showed a profitable day's sales, with increases over both Saturday and Sunday.

Cars began changing hands within a few minutes after the show started. The Frank P. Gmelin Company reported the sale of a five-passenger Briscoe touring car within half an hour after the doors were thrown open, and a little later in the evening disposed of a Mitchell sedan. Walter Judd reported the sale of five Liberty cars: the Paige Sales & Service Company, two Paiges; Knight Motors, one Handley-Knight and one R. & V. Knight; Smith-Glines, two Stephens Sixes; Harrison-Rund, one Moon; Frank-Kennedy, one Stutz; Steamer; Weisman Motor Sales, one H-C-S; Thompson Auto Company, two Maxwells; Cadillac Motor Car Company, one Cadillac, and the Potts Motor Sales Company, two Haynes. With the larger booths, possible by reason of the handsome space provided in the Morgan & Wright building, it was no uncommon sight to see four or five salesmen explaining one model to as many prospects.

Nor was the interest confined to the main building. Crowds have been surging in and out of the Annex, which houses passenger cars, trucks, trailers, tractors, accessories and the airplane exhibits. The latter are proving a drawing card of no mean pulling power. One accessories dealer reported that his sales the first three days of the show were 50 per cent greater than he had hoped.

Much credit is due H. H. Shuart, manager for the D. A. D. A., for the splendid decorative scheme and the arrangement of the exhibits. Mr. Shuart has shown an eye for real beauty combined with utility, and the crowds as well as the exhibitors are unstinting in his praises.

Automobile shows have become a fixture in the life of the people. In fact, there is plenty of evidence to show that these annual displays of the automotive industry are becoming more popular every year. Gradually every city and town in the country is falling into line with an exhibit, be its dimensions great or small. Where a dealer organization does not exist, the show is promoted by the individual dealers, and in a good many cases where some of the agents do not care to stage a show there is to be found at least one more enterprising who make it a personal affair, and generally does not regret his efforts. Reports from the scores of communities where shows have been held thus far this year indicate that while in some cases the business at the show has been nothing to brag about, the event was the means of calling to life the latent interest and buying power.

This year the shows—all the shows—have a greater importance than in former years. They are being held much more for the purpose of bringing about a buying revival than in this city. That seems quite logical inasmuch as Michigan is the automobile manufacturing center of the world. Some people think so only because of the fact that the largest producer of automobiles is located in Detroit. They forget, however, that it is not on account of Ford that Detroit is the premier city in the industry, but rather by reason of the fact that there are about twice as many automobile makers located in and about the city as in any other city in the world.

There are a number of reasons why the 1921 show of the Detroit Auto Dealers' Association is such an impressive affair. For one, for the first time it is housed in a building which is more appropriate for it than most any of the structures pressed into service in other years. The dealers all were able to obtain more space and thus could make a much more adequate display. At that, it is probable that if the show management had been able to measure in advance the big demand for exhibition space, an effort would have been made to obtain another floor in the main show building.

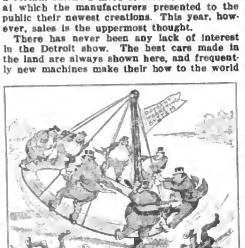
There are two cars which, strictly speaking, were brought out for first time in public at this show—the Kess-Line Eight, made by the Kessler Motor Company, Detroit, and featured by the Kessler Super-Charge engine, and the Friend Light Four, made by the Friend Motors Corporation, Pontiac.

Shown for the first time in Detroit are half a dozen fine cars, which, however, are already in regular production. In fact, there are many of them already in the hands of users. The list may be headed by the Lincoln, made by the Lincoln Motor Company, Detroit; the LaFayette, made by the LaFayette Motors Company, Indianapolis; the Gardner, made in St. Louis, Mo., by the Gardner Motor Company, Inc.; the Hanson, made in Atlanta, Ga., by the Hanson Motor Company; the Handley-Knight, made in Kalamazoo by the Handley-Knight Company; the Harley, made by the Harley Motor Car Company, Kalamazoo; the Moon, made in St. Louis, Mo., by the Moon Motor Car Company; the Daniels, a Pennsylvania product, made by the Daniels Motor Car Company, Reading, the H-C-S made by the H. C. S. Motor Car Company, Indianapolis; the Sheridan, a new General Motors product made in Muncie, Ind.; the Ace, made in Ypsilanti, by the Apex Motor Car Company.

In addition to these there are a score of new models made by old timers or concerns whose other models have been handled in the city for some time.

Many ingenious models, demonstrating working parts, have been prepared by manufacturers.

If the cars on display indicate the season's tendencies, bright colorings, luxurious designs, gorgeous upholsteries and devices which will insure simple operation predominate. There are many novelties. Marvelous bodies, in natural wood finishes, metal parts in polished nickel and steel, continental type headlights and fancy steps in place of running boards are evident in many designs.



The art of the "carossiere" is displayed strikingly in the Packard, McFarlan, Cadillac, Pierce-Arrow, Lincoln, LaFayette, Marmon, R. & V. Knight, Roamer, Peerless and Paige exhibits. "Carossiere" is the correct term in French for elite coach building.

Bodies generally seem to run to the low rangy models, with speed and comfort in every

Reported Cleveland Cliffs Will Build a Steel Plant

Of interest to Michigan is the report that the Cleveland Cliffs Iron Company, which has properties in this state and in Ohio, Minnesota and Wisconsin, is preparing for extensive expansion, and among other things will put up a steel plant. In this connection the Wall Street Journal prints the following from Chicago:

"Further indications that the Cleveland Cliffs Iron Company, holder of extensive property on the east shore, from Marquette to the Isle, intends to go through with the plan for the construction of a great steel plant on the east side is shown in a $7,061,000 real estate transfer just filed with County Recorder Wells.

"All holdings of the Cleveland Cliffs West Virginia Corporation under this transfer are conveyed to the new Cleveland Cliffs Iron Company, an Ohio corporation which was organized on December 20, 1920.

"Property of the concern in Ohio, Michigan, Minnesota and Wisconsin, much of it in rich iron districts, are transferred to the Ohio corporation.

"It was announced by officials of the company that the transfer is only a formal requirement to place the property on the records of the Ohio company and that stockholders in the West Virginia concern have received similar holdings in the new incorporation. All of the properties in various cities have been transferred also. The transfer is understood to mean in the business world that the company will in the near future begin the big construction program on the east side, thus making Toledo the production base for all raw materials from its holdings in other states.

"The Cleveland Cliffs concern realized the property taken over by the Government during the war for the building of the big nitrate plant.

"The Government now is involved with the company, which is seeking to collect large rental and also damages alleged done to the property."

ELECTRICAL BUSINESS IMPROVES

Manufacturers of electrical equipment report a general improvement in business, although buying is not brisk, nor will it be until the financial situation improves. It is known that there are construction plans which call for a great amount of equipment, but the utilities in question are held back by their inability to obtain money. The Pacific coast utilities are showing the greatest activity at this time. The California Edison Company, for instance, has a 15-year program of construction work that will cost $200,000,000. Some of the equipment has been ordered.

WHITE ADDRESSES S. A. E.

Prof. A. E. White, director of the Department of Engineering Research at the University of Michigan, was the guest Friday evening of the Detroit Section, Society of Automotive Engineers. He spoke on "The Relation Between the Industry and the University of Michigan."

In the list of new corporations published in the issue of March 12, Michigan Manufacturer & Financial Record, the name "General Safety Corporation" should have read "National Safety Corporation," which is the correct name of a Detroit concern established to provide expert safety and fire prevention services. The mistake is acknowledged and this means taken to correct it.

CANADY FORMS ADVERTISING CO.

The United States Advertising Agency has been formed in Toledo, O., by Ward D. Canady, Geoffry J. Dwyer, G. R. Carpenter and Hubert O. Bennett, all formerly connected with the Willys-Overland Company. The firm has been incorporated under the laws of Delaware, with capital of $50,000. Mr. Canady has been advertising manager of the Overland company for the last five years. Mr. Dwyer was in charge of publications and publicity. Mr. Carpenter was connected with the advertising department and Mr. Bennett is the son of George W. Bennett, who was at one time vice-president and general manager of Willys-Overland. The new firm was formed after a deal had been made by Mr. Canady for the handling of the advertising of the Willys-Overland Company. The Overland account has been handled during the last few years by the Martin V. Kelley Company.

FORD ON THE BUSINESS SITUATION

Henry Ford and his son Edsel made an inspection of the Detroit, Toledo & Ironton Railroad last week. To a representative of the Toledo Blade Mr. Ford is quoted as saying that he sees America more than half way along the road leading to normal industrial production and the purchasing power of a dollar increased by 50 per cent.

"I don't know precisely what 'normalcy' means," Mr. Ford said, "but I know the future rests in the state of mind of the American people. Heaven, yes, I am in a state of mind. But there must be a willingness to work, to do the task at hand, and where that is found there is work for everybody. There has been a period when we have forgotten the need for digging in real estate in the more illuminating prospect of buying real estate."

Railroad Needs Told Flint's Traffic Club

Flint's Transportation Club, an organization of railroad men brought into existence two months ago, entertained 150 members and guests at the first annual banquet in Hotel Durant, last week. F. A. Butterworth, Chicago, assistant general freight agent of the Pere Marquette, was the principal speaker, his address being a review of the general railroad situation.

"The charge that the high railroad rates are largely responsible for the present business depression is without foundation," Mr. Butterworth said. "The business depression was bound to come. The railroads are suffering from two general conditions, which, in turn, will result in a revision of rates downward."

Flint's contribution to freight volume was discussed by George C. Conn, director of traffic of the Buick Motor Company. In 1920, he said, the industrial establishments of the city produced more carload freight than the four leading agricultural products of the whole state. This increase in industrial business and the work of transportation organizations of this character has brought railroads and shippers closer together.

ENGINEERS ORGANIZE COMPANY

Frederick H. Mason, commercial engineer, has organized by Frederick H. Mason Company with E. E. Tipton and R. C. Coberly as associates, and will furnish commercial engineering service. The office is in the Moffat building, Detroit.

TRIPP MFG. CO. RESUMES

After having been practically idle four months, the Tripp Manufacturing Company, Allegan, is reported to have resumed production with a full force. It was said that the demand for its products, shock absorbers, locks and steering wheels is nearing normal.

Former Kalamazoo Man Invents a Steam Motor

George Coats, formerly of Kalamazoo but now living in Indianapolis, has developed a new type of steam car which he believes he can sell for $1,000. It is a five-passenger, six-cylinder car with a fire and water tube boiler so constructed that it can be used under any type of hood. The steam line leads direct to the rear axle, which is an engine and axle in one unit. In this axle the power is divided, part sent to one half of the housing and part to the other half. The engine is no larger than an ordinary axle gear case. Differentials are eliminated.

The housing of each half of the axle carries three fixed cylinders, set at 120 degrees. These cylinders are like those of the automobile engin, with poppet valves, pistons and connecting rods. The bore is 2⅜ inches, stroke 3 inches. The three connecting rods in each half are pivoted to a crank pin integral with the drive shaft of each wheel. At a speed of 40 miles an hour, the engine is running at 500 revolutions per minute.

An overlapping stroke is obtained. Before one cylinder is entirely off pressure, another has begun to take hold, and the third is completing the motion. In actual tests the cars are said to have done 20 to 40 miles on one gallon of kerosene. With this type of steam and water cycle, one filling of the water tank runs the car from 300 to 500 miles.

The exhaust steam is taken by return pipe to the condenser which is located in front of the boiler in the position of the ordinary radiator. The initial heating for starting is electrical, controlled by switch on the cowl board.

An automobile expert has declared that the engine had power enough to pull a switch engine. Yet it is smooth and flexible. The range is not three speeds or four speeds, but any speed from drifting to 60 miles an hour, the whole range being controlled by one lever on the steering wheel. There is no gear in the power line of the car, and the power is never separated from the load to go from one speed to another.

MICHIGAN PAYROLLS GROWING

Considerable increase in the payrolls of Michigan manufacturers during the last month is reported by Harry B. Martin, secretary of the Michigan Employers' Casualty Company, Lansing, who has been calling on employers in various parts of the state. Competitive selling is here to stay, he says, and manufacturers who have hustled for business are operating. The head of one Lansing firm, which found nearly all of its orders cancelled, packed his grips and personally went out and got business, so the company is operating to its full capacity. Mr. Martin says Lansing is doing better industrially than any other city in the state.

MAKING 50 WASHERS DAILY

An average production of 50 electric washers a day has been reached at the plant of the Universal Utilities Corporation, in Alpena, where output for some time had been considerably reduced. About 35 men are now employed.

LAUZON FURNITURE ON FULL TIME

Full time operation has been resumed at the plant of the Lauzon Furniture Company, Grand Rapids, which makes living room furniture and phonograph cabinets. The men whom the company laid off the first part of the year are back on the job.

NEW ADRIAN MANAGER

John W. Koehn has become general manager of the Adrian Brass & Aluminum Castings Company.

Life and Industry in India

Detroit Engineer, Returning After Three Years, Tells of Some of the Trade Opportunities Open

NOT MORE than a dozen tiger leaps from the jungle in the half-Oriental, half-Occidental city of Jamshedpur, India, two blast furnaces pour their fiery liquids regularly to supply the steel needs of two civilizations a thousand years apart.

One of these furnaces represents little or no investment, is operated by an ancient and honorable punjab and his two sons and has an output of 10 to 15 pounds of very good steel a week. For more than 1,000 years this "plant" has been the possession of one Hindoo family, and in every respect is no different today than when its originator first learned his primitive art.

The other plant represents an investment of $250,000,000, employs 42,000 men and women and prodnces monthly 17,000 tons of raw and fabricated steel. Snch extremes in industrial proficiency and efficiency seldom and found in such proximity.

George E. Maxiow, who ran across the ancient blast furnace, was an American engineer supervising the construction of the great steel mills of the Tata Iron & Steel Works at Jamshedpur, a new industrial center which is growing up at the very edge of India's impenetrable jungle. Mr. Maxiow recently returned after three years resitence in Jamshedpur, and is now general superintendent at the plant of the Detroit Range Boiler and Steel Barrel Company.

Following his discovery of the ancient furnace Mr. Maxiow paid many visits to the open-air plant for the purpose of studying the primitive steel-making methods. The Hindoo punjab, as all skilled workers in India are known, apparently operated his furnace as a side line, his main occupation being that of a farmer. The industrial program has followed was about as follows:

On Monday he collected his clay and built his furnace, the character of which can be judged by the accompanying illustration. The collection of ore, which lies upon the surface in clods in ore regions of many acres, limestone and delamite kept the old man and his sons busy all day Tuesday. On Wednesday he collected his wood and burn d his charcoal, charged his furnace on Thursday, and retired to his farm to spend Friday and Saturday.

Sunday morning he returned and connected to the furnace his blowers, consisting of two goatskin bellows attached to the furnace by means of bamboo pipes. This work completed, the process of steel making began. Until late in the afternoon either the old man or one of his sons did a sort of Dervish dance on the bellows. Standing with one foot on one bellows and the other foot on the other, the operator patiently and laboriously pumped air into the furnace.

At various times during the afternoon the old man tested the molten metal with an iron rod. When satisfied with the smelting, he knocked a hole in the side of the furnace and permitted the metal to flow into a hole in the ground, and left it to cool. This lump of metal he bartered for rice or such other provisions as he needed, to some metal worker, who converted the steel into ax heads, knives, arrow and spear heads.

EXTREMES IN INDIAN INDUSTRY

The larger photograph shows a section of the $250,000,000 mills of the Tata Iron & Steel Works, at Jamshedpur, India, while in the insert is shown the primitive blast furnace of the Hindoo punjab, only a short distance away.

Although Mr. Maxiow spent three years in India, during which time he traveled over much of the country, he never found another furnace of this type and so far as he could learn his punjab friend had a monopoly on primitive steel making in that part of India.

It is quite likely that such simple smelting methods were sufficient before India's more enlightened Parsees and her foreign residents began to thirst for Western civilization and modern inventions. Certainly the punjab and his chimney pot furnace would fall miserably in meeting India's steel requirements today. Railroad construction is increasing yearly, steel reinforced structures are replacing mud huts, rivers are being bridged and machinery is taking over the age-old hand methods of production.

The great Tata steel mills, which Mr. Maxiow helped to build, are but one indication of the coming industrial development of India. While they lie in a region having an inexhaustible supply of iron ore, to obtain which no mining is necessary, the nearness of material supply was by no means the main incentive for establishing the plant. India needs all the steel it can get for the next 100 years, Mr. Maxiow says.

The Tata plant was financed by Parsees and Armenian Jews, the chief promoters being Sir Sassoon David, an Armenian Jew, and Sir Dorab Tata, a wealthy Parsee, or Indian capitalist. C. C. Perrin, New York, was the consulting engineer. When Mr. Maxiow left Jamshedpur, plans were being made to enlarge the plant to three times its capacity and employ 80,000 natives in the manufacture of steel rails and structural shapes.

Within easy hauling distance of the plant there are acres and acres of splendid ore which seems to have been broken out of the earth by some tremendous upheaval.

"I do not believe," Mr. Maxiow says, "that the supply can be exhausted in a thousand years. A rail line has been run into these fields and gangs of natives pitch the ore chunks into the cars. That is about the extent of the mining. Within easy distance of these deposits there are limestone, coal, delamite and magnesite deposits. Money to finance these operations appears to be equally plentiful. The Parsees, or capitalists; the Janes, or merchants; the Mawarries, or rice, corn and jute growers, and the Bengals, or professional men, are all wealthy and quite ready to invest in industrial development.

"The greatest need in India today is manufactured drugs, machinery, tools, shop equipment, stoves, steel barrels, small steel products and electrical goods. So far as I have been able to see there has been no real energetic selling done by foreign concerns. Various foreign companies have sent agents into India, but the major part of their efforts to develop business have been conducted from hotel verandas.

"Their idea seems to be to wait until some Rajah wants something bad enough to come after it, which to an American's mind is a poor way of building up foreign trade. Detroit and Michigan manufacturers many of the commodities India needs and is ready to buy. I believe that if the manufacturers interested in foreign trade would club together and send a representative to India it would be well worth the cost.

"Labor is never a serious problem in India.

Copper and Brass Milling

How This Industry Overcame Obstacles in Michigan; What It Has Accomplished; Something About Processes

THIS is an age of steel, but there is a lot of brass in it. It takes a lot of brass to make the average man a going concern. One kind of brass the successful man needs, and usually has plenty of, is not made in a mill; therefore we will not talk about it. The other kind he has thrust upon him in one form or another. He has it in his shoes and he fastens his belt and sometimes his trousers with it, although it may bear another label. His watch is full of it. His automobile would be a hopeless heap of junk if there was not brass in it. In his home the electricians have camouflaged the lighting wires with brass. If he has the nightmare in the night he is likely to bump his head on brass.

Wherever there is brass there is copper, because brass is a fusion of copper and zinc; so that if more is said about brass than copper, just remember that copper is a silent partner in everything to be said hereafter. This being an automotive center, where one out of every few inhabitants own an automobile, and the rest either run around in one or are run over by one, the most pointed remark we can make about brass is that it is a vital element in the carburetor, which in turn is the heart of the motor car. If that little needle valve, which is made of brass, is not made right, the carburetor is no good, and neither is the rest of the car. If the brass with which the needle valve is made is not mixed correctly, the carburetor will go on the blink; therefore the brass industry pricks us just where we live, ride and have our being.

It's an Old Industry

Long before man began to keep records of his life and occupations he worked with brass, copper, tin and bronze. The ancient habit of making a funeral also a general moving day and carrying all the deceased's goods and chattels to the grave with him has provided succeeding generations with some knowledge of early metallurgy. Bones may come and bones may go, but brass goes on forever. The early civilizations of Britain seem to have cornered the brass-making industry, from whence it was brought to America along with Puritan purity.

History says the first attempt to cast brass in the American colonies was in 1644, and the brave soul who tried it was John Winthrop, Jr., in Lynn, Mass. In 1790 Henry, Silas and Samuel Grilley had a brass button factory in Waterbury, Conn. In those days brass buttons on the Colonial "soup and fish" were as chic as short skirts and waistless waists are today. The buttons were cast from brass until Abel and Levi Porter joined labors with the Grilleys and began making buttons from sheet brass. They used the process of Adams Emerson, an Englishman, and rolled the first brass in this country. Prior to this time one of the great New England home industries was the manufacture of pewter buttons. Brass outshone pewter to such an extent that the Waterbury buttoners saw the handwriting on the wall and began making brass buttons, which necessitated the rolling of sheet brass.

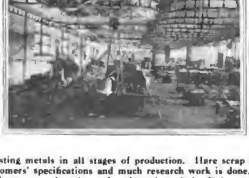
This thumbnail sketch is offered merely to show why New England has been for so long the home of the brass-making, rolling and fabricating industry. It is important because it shows that when Michigan, with its wealth of copper, undertook to tackle the brass business it did so against heavy odds.

Brass-making, especially that branch of it having to do with mixing, or fusing copper and zinc, is one of the few industries left in which the human element rules supreme. You can dig all the copper in Michigan and gather all the zinc in creation, build a fire, put a pot on and boil the metals until the copper is skating in Gehena, but there is no guarantee you will get brass.

It is one of those arts like tempering—it starts out as heritage and sticks in the family like a lazy brother. The secret is a combination of eyesight, smell and temperament. A born brass maker, and there are no other kind, can tell by the color of the flame from his pot of copper porridge when to dump in the spelter; and his sense of smell, or some other sense not catalogued, tells him when to tip the bucket. For years England had the brass business sewed up in a sock. The mixers and casters, like royalty, succeeded each other to 24-hour-a-day jobs, five days a week. They ate, drank and slept brass.

There is no record of any brass makers in the Mayflower; therefore when the art was started in this country, much to the disgust of England's brassmakers, it was necessary to smuggle mixers and casters from England in hogsheads. Some stayed, others quit cold and went back to their beer and skittles. Those who remained married docile wives and reared "brasslings," who in turn did likewise, and so on and so forth. Thus we have in this country "brass-bloods" as well as bine bloods and, believe us, they know it.

Within 25 miles of New York 75 per cent of the copper and brass refinement is done. There are 30 brass and copper rolling mills in the United States and 19 of them are in Connecticut; hence the brass-making aristocracy is there, too. All the years that Michigan has been yielding its wealth of copper as the third largest copper state in the Union, the New England States have been buying it and making brass with it.



Brass fixtures, brass novelties and brass wares of all kinds sold in Michigan were made in Connecticut, or somewhere in the New England States, but more often than not, they had Michigan copper in them. It is natural, therefore, that the idea of having brass and copper foundries, rolling mills and fabricating plants in Michigan should possess certain men. Well mixed with money and grit, ideas make progress and industry.

Automotive Industry Provides Market

The first mixture of grit, money and ideas resulted in the Detroit Copper & Brass Rolling Mills. It produced sheet and rod brass from which were manufactured teakettles, coffee pots, household utensils, roofing, fixtures and a multitude of other products. While the pioneers in Detroit brass and copper milling did not have to import skilled labor in hogsheads, they had to have the skill and it had to come from the New England States. Generous pay and transportation brought brass workers. They stayed until they found there were no hills or mountains in Detroit, then they lit out. Labor turnover and New England brass-making traditions came near putting out the crucible fires.

Then along came the automotive industry like the shower of manna in Scripture. There was more brass in, as well as behind, the early motor cars than there is now. Who will ever forget those rear-entrance tonneaus with as much brass on them as a yacht, the brass

At the left is shown a brass laboratory for testing metals in all stages of production. Here scrap is tested for its percentage of alloys, finished products are put through to see if they meet with customers' specifications and much research work is done. Photo taken at the plant of the General Brass & Aluminum Company, Detroit. In the center is shown a modern brass foundry—that of the Roberts Brass Manufacturing Company, Detroit. Note the coke furnaces, with crucibles and crane. At the right is shown an inspector testing a product at the plant of the General Aluminum & Brass Company. There is rigid inspection all along the line. For the production of many small brass castings, particularly for automotive work, an inspector is posted at every few machines.

Digitized by Google

radiator cases and the brass band tunes they played? There is not so much brass used in a car today, but more cars are made, hence more brass goods are manufactured.

After the Detroit Copper & Brass Rolling Mills came the Michigan Copper & Brass Company. These constitute two of the 30 mills in this country, and they are in Michigan, in the heart of the automotive industry. Both of these concerns have fought hard against New England traditions. Even the automotive industry in the state offered them little encouragement, not that the product was not right, but more because of the aforesaid traditions.

Just as it takes heat to make brass, so it takes fire to test the mettle of industrial builders. Instead of succumbing to discouragements, the builders of copper and brass-milling industry in Detroit improved their methods, hired the best labor and bought the best machinery. It takes a lot of money to set up a rolling mill, A. B. Selig, secretary and general manager of the Michigan Copper & Brass Company, says that the successful establishment of a copper and brass rolling mill requires a capital of at least $3,000,000.

Huge and Expensive Machinery Used

The character of the industry calls for an enormous amount of working room and ponderous machinery. The largest rolling mill concern in the brass and copper industry covers 150 acres, others have 14 acres up. The kind of machinery used in these plants can be judged by the fact that it is possible to put a brass billet, two feet long, six to seven inches in diameter and weighing about 200 pounds, into one end of a machine and collect at the other end such finished products as hinge parts, door casings and other shapes too numerous to mention. The manufacture of these articles from brass billets requires machinery developing a pressure of 1,000 pounds to the square inch, for the brass bar is forced through a die that cuts the shape entirely by pressure.

Making shapes, however, is not the main business of Detroit's two mills. Sheet making and drawing rods for fabrication is the principal work. The rods are used largely for turned products and the sheets for stamped. The facilities of the two concerns permit a production of approximately 100,000,000 pounds annually, the Detroit Copper & Brass mills having somewhat greater facilities than the Michigan company. Each company, however, specializes in certain products for which it has the particular type of machinery necessary.

Like nearly every other industry in the state, these rolling mills were drawn into Government contract work during the war and thereby made more money than had been possible during the pre-war years. There is a small margin of profit in the brass business and consequently the sales volume must be large to meet expenses and show any gain. Unlike the steel business, for instance, the cost of raw materials constitutes a large item. Copper, of which two pounds is used to every pound of zinc, has cost from 10 to 12 cents a pound. Fuel has been a costly item. The immense machinery necessary runs into thousands of dollars, and after raw materials, fuel and machinery are accounted for, there is the labor charge. As I have shown, any old kind of labor will not do, hence the price must be paid for the skill required.

Detroit District Largest User of Brass

When it is known that more brass goods are sold in the Detroit manufacturing district than anywhere else in the country, if not the world, the future of the copper and brass rolling mill industry can be fully appreciated. It has taken years for the two Detroit concerns to build up confidence in their products, but the battle is fairly won. Much can be said for the facilities and manufacturing ability of the New England mills, but all the ability is not there, and whatever facilities they may have can be, and have been duplicated so far as required. Not only that, but if the brains and skill in brass milling have originated largely in New England, the transplanting to Michigan soil has been a mere matter of reward and transportation. The men who guide Detroit's mills and the men who work at the machines are New Englanders, or at least many of them are. They brought to Detroit the knowledge and skill necessary to successful plant management and brass and copper milling, hence it cannot be said with fairness that because these mills happen to be in Michigan, their product is not as good as that from the East.

Probably because of its industrial youth, Michigan has so far missed opportunities to develop to the utmost industrial plants for the refinement and fabrication of the raw materials in her soil. Practically all the copper used in industry comes from the Middle West and west of the Middle West. It is mined and transported at great expense over great distances to mills located as near to seaboard as possible, which would give the impression that export business was the first thought. In a semi-refined or wholly completed state, the copper, or copper alloy products are again transported back to the Middle West and the Far West. The establishment of rolling mills in Detroit is merely one of many illustrations of economic wisdom of production near the raw material supply, and helps reduce the high costs of products to the ultimate consumers.

No attempt will be made to go into the technical details of brass making and fabrication. It is too deep and too wide a subject to be treated in a limited space, but a brief outline of a few of the principles of brass manufacture will be given merely to show the character of the industry now being so rapidly developed in this state.

In the whole category of brass manufacture the most important operation is the melting and casting. Any failure in this initial operation cannot be rectified by any later operation. Despite this fact it is the concensus of opinion of all brass makers that the least progress has been made in the development of scientific processes which will eliminate the human equation. Another interesting fact is that, while the plants and much of the equipment used today in brass melting have been improved and changed somewhat in character, basically the methods are the same as used in the Middle Ages. The crucibles, furnaces and molds still bear a marked resemblance to those used by the ancients. While the mechanical fabrication of brass has been developed to a wonderful degree, the first processes handed down from father to son through ages have been secrets jealously guarded.

Section of rolling mill where brass and copper in rolls are produced. View shows brass used for radiators. Photo from Michigan Copper & Brass Company, Detroit.

The furnaces, as a rule, are of the natural draft-pit type, square in shape. Anthracite coal or coke is used for fuel. The ancients used wood or charcoal. The crucibles are made of clay and graphite and have a capacity of from 160 to 300 pounds of metal. The life of these crucibles is from 25 to 35 heats, according to the care with which they are used. Modern molds are made of soft, gray iron, hand finished. The molds of the early brass makers were made of stone.

The copper is put into the molds and heated until it shows a certain color and then zinc is added. Brass intended for sheet rolling is cast in flat bars of various widths, while that for rods or wire is cast in cylindrical billets. For tubes these billets may be solid or hollow, but are cylindrical in shape. The whole responsibility for the quality of brass produced rests with the caster.

60 to 70 Per Cent Copper

Common brass, as the term is commercially used, applies to a mixture of from 60 to 70 per cent copper and the balance zinc, the percentage of copper varying according to the class of work for which the metal is to be used. Of course it is very seldom that all virgin metal is used; as high as 50 per cent scrap is utilized, depending largely upon the type of scrap and the class of metal desired.

When correct box moulds are used it is not necessary to anneal the metal before the breakdown process, except in the case of leaded stock, when it is advisable to give the metal a heavy annealing before attempting to roll. However, in some mills the old match moulds

Detroit Entertains Mexican Trade Delegation

LAST SUNDAY the Detroit Board of Commerce entertained and was entertained by a delegation of Mexican business men who stopped in the city as part of a tour of 28 American cities which began February 26 at Mexico City and ends April 18 at the same point. The itinerary includes the west coast of United States westerly through Chicago, Cleveland and Buffalo, to Boston; westerly through New York, Philadelphia, Baltimore, Washington, Louisville, Cincinnati, New Orleans, and returning via Laredo and the National Railways of Mexico. It is interesting to learn from these gentlemen that there is now through Pullman and dining car service from San Antonio to Mexico City and that other through arrangements are soon to be effected. It is about 1,000 miles from Laredo to Mexico City and takes about 36 hours. The delegation is in the United States as official representatives of the Confederation of Mexican Chambers of Commerce and is designated as "the Good Will Committee." There are 58 individual chambers of commerce in the Confederation which have joined to hold an international industrial convention and exhibit in Mexico City the last week in June.

The delegation was given automobile rides around the city which took in the industrial plants, Belle Isle and Highland Park and the Rouge, and was billeted at the D. A. C., where in the evening the visitors and representatives of the Board held a get-together dinner. Arthur T. Wsterfall, vice-president and assistant general manager of Dodge Brothers, guested. The Detroit point of view was given by J. Walter Drake, chairman of the Board of the Hupp Motor Car Corporation. Fernando L. Novelo, president of the Confederation of Mexican Chambers of Commerce, responded. Senor Novelo's remarks were in Spanish but were conveyed to the assemblage by W. L. Vail, vice-president of the Trust Company of Mexico, who is a thorough linguist. It was frankly asserted by Senor Novelo that the business interests of Mexico were anxious to promote friendly relations by every means possible—that the principal object of the tour was to invite American business men to attend the June convention wherein a first hand impression of Mexico today may be obtained.

Adolfo Martinez, director of the Confederation and chairman of the mining section, gave some interesting figures on the metal situation in Mexico. During 1920, he stated, the country produced 654,910 ounces of gold, 63,658,471 ounces of silver, 101,538,183 pounds of copper, 267,715,825 pounds of lead, 31,665,082 pounds of zinc and 180,260 pounds of mercury. Of the last mentioned, 40,000,000 ounces were used in the motion picture film industry. Silver, he asserted, was purchased by the government mint at a fixed price of 54 cents, so that the demand was limited to the normal consumption of pocket money of the people.

Bruno Newman, an American hailing from Boston originally, and who is a director of the Confederation, is president of the Lion Brand Products Company of Mexico and also a director of the American Chamber of Commerce of Mexico, talked interestingly on the petroleum situation. He asserted that only one fifth of the actual oil available was being mined because of poor facilities for transportation, the remaining four-fifths of the wells being capped until railroads and other facilities become available. He said very pointedly that if the United States was to hold on to the 80 per cent majority of Mexican foreign trade it must begin at once to develop the business intensively because of the new life being injected by British and other European countries into Mexican sales campaigns. He laid emphasis on the investments which Britain is making in Mexico, which ultimately will give the English traders a considerable advantage.

Hernando J. Zetina operates a modern shoe factory in Mexico City employing 700 hands and turning out 2,000 pairs of shoes a day. His contribution to the discussion was an explanation of a factory school idea which is unique in his plant. There are many boys who are illiterate; so he has established a school of his own. He requires the older boys to go to the school and the younger boys to go part of each day. Before going to work on Monday morning each boy must exhibit a certificate from the school master of his previous week's attendance. It is particularly noteworthy that English is a required study in Senor Zetina's school.

When the delegates alighted from the train at the Michigan Central terminal a mild surprise on finding that three of the nine official delegates were Americans now resident in Mexico and interested in various business enterprises. John B. King, general manager of the Mexico-American Excursion Company, director of this tour, was a newspaper man in Chicago 20 years ago. From these three gentlemen one obtained a comprehensive view of both sides of the Mexican situation. Politics was not officially discussed except the expression of opinion, in answer to inquiry, that as time went on President Obregon eventually would vindicate himself in the eyes of Americans. It seemed to be the opinion that the job of keeping the lower classes satisfied, and at the same time keeping the moneyed interests quiescent, was one which required a dual personality and some action necessary to this end might not always be understood by the world outside of Mexico.

The Mexico-American Excursions, Inc., 1, cinco de mayo, Mexico City, has been authorized by the government to make rates for and to conduct excursions into Mexico.

The banking situation is improving, according to W. L. Vail. There is no accepted currency, all the older issues being non-current at present. All payments must be made in gold coin, silver being used merely for small change. The Mexican Congress is at work on a law which will create a central bank of issue something like the Federal Reserve Bank, and the proposal may be made to the United States to give control of this bank for twenty years in consideration of the U. S. furnishing 51 per cent of the capital. The list of delegates follows:

Fernando L. Novelo, president, Confederation Mexican Chambers of Commerce, importer and exporter of foodstuffs.

Bruno Newman, director of the Confederation and of the American Chamber of Commerce of Mexico; president Lion Brand Products of Mexico.

W. L. Vail, vice-president Trust Company of Mexico.

Adolfo Martinez, director, Confederated Chamber of Industries; chairman Mining section; mine and smelter operator.

Leopold H. Palazuelos, director of the Confederation; importer.

Camilo Sansores, director of the Confedera tion; planter and hemp exporter.

Bernardo H. Zetina, shoe manufacturer.

Humberto Garridan, special representative of "El Universal."

John B. King, general manager, Mexico Excursions Company.

Antonio Espejo, official interpreter.

Mrs. Bernardo H. Zetina and Miss Martha Newman.

ANOTHER LANSING PRODUCT

Another addition to Lansing's manufactured products is being brought out by the Korff Manufacturing Company. It is a steel voting booth originated by H. G. Porter, factory manager of the company. The city of Lansing has ordered 100 of these booths, and a national selling campaign will be inaugurated. The booths are of light steel construction, may be taken down in three minutes and the parts are interchangeable.

CO-OPERATIVE FURNITURE ADVERTISING

One of the principal matters taken up at the meeting of the National Council of Furniture Associations last week in Cincinnati, was the question of co-operative advertising of furniture. It is expected that between $200,000 and $250,000 will be expended on the campaign the first year. Several representatives of Grand Rapids furniture makers were at the meeting.

MORE EMPLOYERS ASKING FOR MEN

THE EBB in the tide of unemployment in Michigan has spent itself, according to M. D. Kirby, deputy state labor commissioner. While the change is not marked, it shows that the movement is now in the right direction. In December and January the reports from the twelve state free employment bureaus showed an increase in the number of unemployed, with fewer employers asking for help, but during February the tendency was the other way, the applicants for jobs dropping while the demand for labor gained. In February 1,467 employers asked for help, as against 1,202 in January, the number of men wanted in February exceeding those in January by 589. The demand for common labor is increasing.

PORT HURON ENGINEERS ELECT

The Port Huron chapter of the American Association of Engineers, recently organized, held its first annual meeting a few days ago and elected the following officers: W. W. Gaskins, Marysville, president; E. R. Whitmore, Port Huron, vice-president; D. M. Belyea, Port Huron, treasurer, and L. C. Read, Sandusky, secretary. Rose and C. A. Hill, and C. E. Wood, both of Port Huron, constituted the board of directors.

COAL MINING AT GRAND LEDGE

The Grand Ledge coal mines instead of being exhausted are furnishing better material as the work continues, says a special dispatch to the Lansing State Journal. The Russell mine has mined and delivered 2,000 tons since July 1 to people coming from Lansing, Lake Odessa, Charlotte, Portland and other points. The new 30-inch vein has been worked about 500 feet and the quality becomes better and the coal thicker as the vein is continued. There are yet about 50 acres of the Russell mine to be mined. Fourteen men are employed.

Digitized by Google

OHIO STEEL INTERESTS MERGED

Plans are being made for the merger of the Berger Manufacturing Company and the United Furnace Company with the United Alloy Company. All these concerns are located in Canton, O. When the merger is completed the assets of the new corporation will be close to $50,000,000. The officers will be: Chairman of the board of directors, E. A. Langenbach; president, Harry Ross Jones; vice-president and general manager, George H. Charles; vice-president and secretary, E. L. Hang; vice-president and treasurer, Charles W. Krieg; Homer Gleeson, assistant treasurer; Paul Moseley, assistant secretary.

MINING OUTLOOK CONFUSING

With independents working along restricted lines and with reduced pay and shorter hours, mining men are at a loss to figure out how matters are going to shape up for the coming season. Operations in Minnesota ranges are said to be the lightest in several years, but many of the mining men are optimistic. They contend that many of the limitations now retarding industrial operations will be straightened out within the next few weeks and that a substantial revival will occur when perhaps least expected. In the opinion of some mining men the next shipping season may open late, due largely to unsettled ore traffic rates on rail and water. Unless these matters are adjusted satisfactorily it is expected that the season will open with light movement of ore.

CLARK DAM CASE QUASHED

Judge L. Burget Deavolgnes, Circuit Court, St. Joseph, has quashed the case against Eugene B. Clark and other officials of the Clark Equipment Company, Buchanan, who were charged by Bainton Brothers, grist mill owners, with having destroyed a dam and mill race in Buchanan. The reason for the decision was incomplete information. An appeal has been taken to the Michigan Supreme Court. The Clark Equipment Company manufactures an internal gear for motor trucks.

POLISH CONSULATE IN DETROIT

Announcement has been made in Grand Rapids by Consul G. Barthel de Weydenthal, of the Republic of Poland, that a consular office has been opened at 80 Garfield avenue east, Detroit, where Vice-Consul W. Kozlowski will vise passports and legalize documents intended for use of any authority in Poland. The office will have jurisdiction over the states of Michigan and Ohio.

OGLEBAY-NORTON OFFICES

The executive offices of Oglebay, Norton & Company and their affiliated interests—Montreal, Castile, Bristol, Fortune Lake, Fort Henry and Brule Mining Companies and Commonwealth Iron Company—are now located in the Havna building, Cleveland, the change having been made on March 1. The office of the range manager is at Ironwood, Mich.

MAPES SEEKS COMMERCE POST

Congressman Carl E. Mapes, Grand Rapids, who is chairman of the committee on the District of Columbia, a position equivalent to being mayor of Washington, has announced his desire to resign and become a member of the House committee on interstate and foreign commerce, a vacancy having been left by the retirement of Congressman Hamilton of Michigan.

MAC-SIM-BAR PLANT RESUMES

The plant of the Mac-Sim-Bar Paper Company at Plainwell, Mich., has resumed operations on a five-day a week schedule.

"MORE DAYLIGHT" PLAN OPPOSED

The Lansing city council has decided not to put the "more daylight" plan into effect this year, because of opposition shown by workers in the factories and elsewhere.

The Business Graphics
OF
ERNST & ERNST

A Necessity in the Control of Business

Clear and accurate mental pictures of your business activities and the conditions of trade are vital to successful management. Dependable figures, of course, must be the basis of such pictures. But to assimilate columns of figures, and get their meaning, requires time and a definite mental concentration not always at command.

The Business Graphics of Ernst and Ernst are the answer.

The value of these charts to the executive or manager in any line of business cannot be exaggerated. They make visible at a glance all progress or decline. They locate weakness and waste; disclose hidden sources of revenue; suggest balance, and point out logical development. It is impossible to avoid their mathematical conclusions. They are simple, definite, final.

Ernst and Ernst Business Graphics are the work of a large and highly specialized department. The preparation of charts is based on sound engineering and accounting principles. These charts reduce to a comparable basis, instantly visible, all elements of a business of whatever magnitude. And by the use of simple standardized methods, the actual preparation of charts is made possible and practical by the clerks of your own office.

Our pamphlet on "Business Graphics," with sample charts in colors, to executives or managers on request.

Corporation Tax Bill Introduced

Measure as Sponsored by the Governor Placed Before Senate by Vandenboom; Legislative News

[*By Staff Correspondent*]

LANSING, March 21.—The Governor's corporation tax bill has been introduced in the upper house by Senator Frank H. Vandenboom, Marquette. The measure provides that corporations of this state file an annual report each August, the first to be made in the current year. It is estimated the returns from the levy will total approximately $12,000,000 every biennial period.

Among the provisions of the bill are: A flat fee of $5 for filing articles of incorporation; a fee of $2 for each annual report of a corporation; a fee of $5 for any amendment to articles of incorporation; a fee of $1 for preservation of records of corporations voluntarily dissolved; a fee of $10 for appealing any case to the board of appeals, comprised of the state treasurer, secretary of state and attorney-general; a fee of $10 for each non-profit corporation and an annual fee of $10 for each annual report.

Under the bill, corporations of the state whose business nets a profit, a tax of one mill is levied against the net value, the basis of the tax to be placed upon the Michigan property of the corporation. A minimum of $25 is fixed in the measure.

A tax of three and one-half mills would be paid by profit-making corporations on each dollar of capital and surplus, although certain conditions regulating the levy are made in the bill. The corporations must pay on their face capital, despite any loss during the fiscal year. On their surplus, the mill tax is levied against the net value minus the capital stock and any liabilities of the corporation.

The par stock is assessed at not less than $1 a share and the tax is levied against either the sale or book value set by the secretary of state, whichever may be higher. When the stock is not divided into shares, the value of the whole property is taken as the capital stock in levying the tax. Under the provisions of the act, the first fees enumerated above are taken in lieu of the tax.

The only corporations exempt from the tax are railroads, interurbans, telephone and telegraph and non-profit corporations. A complete detailed statement showing the assets and liabilities and any added information desired by the secretary of state, must be filed with each annual report.

For violations of the proposed law, the fine of $100 for each offense is provided and $5 for each additional day after the date set for filing the returns. The secretary of state would report any infractions against the law and the attorney general would be empowered to start suit to collect the tax.

While still working usually on the short-hour schedule, the Legislature during last week has passed upon many measures, a number of which are of interest to the manufacturers, financiers and business men. The fence manufacturers of the state have entered a protest against the McNaughton wire fence bill, which has passed the Senate and is now before the House. The manufactrners claim the bill discriminates against Michigan plants and does not protect the farmers from cheap products sent into the state by mail order and other outside concerns. John L. Lovett, general manager of the Michigan Manufacturers' Association, has asked for a public hearing, which is expected to be arranged.

Senator Hicks' fall-train-crew bill was put through the Senate and referred to the House for consideration. Gov. Groesbeck's reconstruction bill, creating a department of agriculture, in which are combined a number of boards and commissions, has been adopted by both houses.

The McDonald bill, which would give automobile owners in the Upper Peninsula and the northern counties of the Lower Peninsula motor vehicle licenses for three-fourths of the regular annual rate because of the shorter season, was defeated in the House. The killing of a person by reckless driving would be made manslaughter and speeding and reckless driving not wanton or wilful but resulting in killing a person, would be negligent homicide, punishable by $1,000 fine or five years in prison or both, under the terms of a bill introduced by Rep. Milo N. Johnson, of Wayne.

Two bills introduced by Rep. William O. Lee, Port Huron, provide for the registration of service stations, garages and automobile repair shops of all kinds, and for the licensing of skilled automotive mechanics.

The joint resolution of Rep. Frank R. Mosier providing for a state income tax has been reported out of committe in the House. This bill is strongly opposed by Michigan manufacturers.

Passenger rates for all interurbans in the state would be fixed by the Michigan Public Utilities Commission, but local franchisees would remain in effect, under a bill introduced by Rep. Andrew B. Giasple, of Oakland county. Expecting that the power of the Legislature to delegate such power might be doubted, and to provide rates during periods when the rates of the Commission might not be in effect, the bill fixes a schedule of 1½ cents a mile for companies where gross earnings equal or exceed $16,000 a mile; 2 cents a mile for companies with earnings of from $12,000 to $16,000 a mile; 2½ cents for earnings of from $8,000 to $12,000, and 3 cents a mile for below $8,000.

A bill by Rep. Charles Evans, Tipton, would give the state administrative board full authority in financing highway construction and would repeal the act authorizing the state to raise funds for road building by taxation or loans, transferring the power to the board.

A bill of Senator Walter J. Hayes, Detroit, would allow banks to lend money from their funds from which they collect interest in advance an interest rate of 7 per cent and also charge $1.50 on each $50 loan for accounting expenses. This is an amendment to the industrial bank law.

BUILDERS' SHOW A SUCCESS

Detroit's 1921 Builders' Show in the Guard Armory had, at the time of this writing, surpassed all previous shows in attendance and general interest. Saturday and Sunday's records showed between 8,000 and 9,000 visitors, while on Monday the attendance was reported at 15,000, more than that for the whole week last year. Exhibitors regarded this as an evidence of a renewed interest in home-building, which promises an active season. The exhibition is far superior to efforts of the builders. One part of the drill hall was laid out as a model street, with various types of houses, each embodying some special feature of construction. Besides the model houses there was exhibited every essential to home building. Good use was made of the information department established as a new feature to give advice and detailed information about every type of building construction. The American State Bank exhibit, the Burton historical collection, the motion pictures and the entertainment program all were appreciated.

Harvey's Sons Co. Will Build

TO CARE for rapidly increasing business, A. Harvey's Sons Manufacturing Company, Detroit, plumbing, steamfitting and engineers' wholesale supply house, announces the erection of a $260,000 reinforced concrete building, to start immediately. The building, which is to be six stories in height, is to be situated on the site of the present structure, at First and Woodbridge streets. It will replace one of the old landmarks of Detroit, for the company has been on the present site since 1855. The building will extend 106 feet on Woodbridge street and 85 feet on First. It will connect up with another six-story branch building, 45 by 70 feet, which has already been erected.

The general contractors are the Walbridge & Aldinger Company and the architects and engineers are Smith, Hinchman & Grylls.

The first floor will house the store and order departments; the second story will be devoted exclusively to offices and show rooms. The other four floors will be used as a warehouse.

The building and equipment will be fireproof, with bins and shelving of steel. A spiral chute will extend from the top to the bottom of the building and all of the latest conveniences for rapid and accurate handling of material will be installed. A loading platform, the height of trucks, will be built across the entire south side of the building.

The president of the company, James Harvey, has been active in the concern more than 50 years. The other officers are Clarence Harvey, vice-president, and George Harvey, secretary and treasurer.

Architect's sketch of the proposed new building of A. Harvey's Sons Manufacturing Company, Detroit.

WHAT THE BEET GROWERS WANT

Michigan sugar beet growers, especially those identified with the Michigan State Farm Bureau, will ask $6.45 a ton this season, on the basis of 5-cent sugar, with an increase of $1.29 a ton for each additional cent increase in the price of sugar above 5 cents, it is announced at the Bureau's headquarters in Lansing. Copies of the contract form have been mailed to 12,000 growers.

BEARINGS SERVICE BONUSES

Two per cent of the net sales income for 1920 was set aside for the payment of bonuses to all employes of the Bearings Service Company who have been with the company more than six months and these bonuses are to be paid shortly.

BUILDING SCOWS AT MUSKEGON

The Michigan Materials Company, Muskegon, has started work on three scows to be used in handling gravel and other building material. Two of the scows will be 126 by 26 feet in dimensions, while the third will be somewhat smaller and will be used for a derrick. It will probably take 60 days to construct the three.

U. S. C. of C. Meets April 27-29

Less Government Management in Business Will Be Theme of Strong Program Prepared

THE GENERAL THEME of the Ninth Annual Meeting of the Chamber of Commerce of the United States, Atlantic City, April 27 to 29, will be: "In the public interest more business methods in government; less government management of business." All of the questions brought before the meeting will be approached as they relate to the general subject. Speakers will include government officials and leading business men in many lines of finance, commerce and industry. Much of the work of the convention will be done in group sessions. Groups representing the major divisions of business will take up, first, problems peculiar to the industries or interests within the group, and second, major problems common to all business, which will include the question of the tariff and that of taxation.

The program for the meeting marks a new departure for the Chamber in that groups will discuss questions of a more general nature than those affecting solely the industries within the group. The purpose of this is to get the fullest and freest discussion on broad general problems that touch various phases of business differently. In a membership as comprehensive as that of the Chamber, there is always a difference of viewpoint on important questions. The group arrangement as planned gives related industries the opportunity to express their views. Afterwards, the Chamber if it is considered necessary, can take a referendum vote of its membership on the questions considered and get after proper consideration the opinion of business as a whole.

On the day before the convention opens there will be a meeting of the National Council of the Chamber, made up of one representative from each of the more than 1,400 organizations included within the Chamber's membership.

In the first day of group meetings, the group representing domestic distribution will discuss current price declines and their effects; constructive means for better marketing by produce exchanges and boards of trade, and methods of merchandising which will enable the distributor better to meet conditions of financial stringency.

Treatment of wages, contract cancellations, better accounting methods and the need of national statistics on production will be taken up by the group representing fabricated production. The finance group will have before it matters connected with the government's fiscal policy, taxation, including the proposed turnover tax, reorganization of government operations and the question of the government's future policy with respect to rediscount rates.

The group on foreign commerce will discuss foreign trade matters, including in its program such subjects as these: The work of national foreign trade conventions, foreign trade work of national trade bodies, foreign trade work of chambers of commerce, foreign trade work of banks, railroads and express companies, and the operations of foreign trade clubs. The aim is to give an opportunity for an interchange of information as to the most approved methods of extending and prosecuting foreign trade effort. In connection with this group a meeting will be held for foreign trade organization secretaries.

The insurance group will discuss among other things: Private initiative as against state monopoly in insurance, insurance as a credit factor, and the relations between government and insurance.

Recent agitation in Congress looking to the enactment of legislation which would provide for government management of basic industries will furnish the subject for discussion in the natural resources production group, where the main subject will be the Government's relation to natural resources, including lumber, coal and oil. Another subject which will be taken up by this group is that of the proper activities of trade associations.

Transportation and communication will be considered under two groups; the first having to do with shipping, and the second, railroad transportation. The subjects to be taken up by the shipping group are: Sale of government-owned ships, the continuance of the Shipping Board and its functions as an operating organization, and differentials in cost of operation under various flags. The railroad transportation group will go into a report by the Chamber's railroad committee, the present financial situation of the railroads in relation to plans for consolidation, and the shippers' part in rate-making.

The civic development group will discuss schools and social interest.

When the groups meet to take up the subjects of taxation and the tariff, each group will consider, with relation to taxation these questions: Should there be an increase in the income tax? Should there be a sales tax? Should there be a resort to loans? With regard to tariff policies these questions will be gone into:

Should not the tariff be framed with due regard to export trade sales or the protection of manufacturing in the United States?

Should the fact that we are now a creditor nation alter our tariff policy with respect to protection?

Should the United States tariff other trading or bargaining possibilities for international commercial treaties to encourage our export trade?

Should the United States tariff be liberal in its provisions in view of our desire for liberality of tariff on the part of other countries?

Taxation and tariff policies will be discussed also at one of the general sessions of the meeting. Other subjects which will be gone into at the general sessions, include foreign financing, the International Chamber of Commerce, education, international relations and the relations of government and business.

A TRADE MARK DECISION

The Billings & Spencer Company, Hartford, Conn., has won an important trade mark suit in Canada, the Exechequer Court having decided against the Canadian Billings & Spencer Company, Ltd., ordering the Canadian registration of the company's trade mark expunged. In explaining the case, H. E. Hart, attorney for the American concern, states that in 1906 the Canadian company bought machinery from Billings & Spencer, Hartford, and a concession was permitted by which the buyers made use of the "Triangle B," the trademark of the company for a time, but the buyers had no permanent legal right to use this trade mark. A year ago it became clear that the interests of the Hartford company were being jeopardized and the suit followed.

REVIVAL IN TECUMSEH

Word comes from Tecumseh that the Heesen Brothers & Company foundry has resumed operations after a shutdown of a few weeks. The Quaker Oats Macaroni Company's plant, which had been closed for some time, reopened recently with a small force.

Digitized by Google

BRICK CONCERNS MERGED

The Briggs Company, Lansing, has increased its capitalization from $150,000 to $400,000 preparatory to consolidation with the Briggs Clay Products Company, Grand Ledge. The Briggs Company purchased the property of the Michigan Clay Products Company last year, but it has been operated as a separate company. The Grand Ledge plant has been renovated and new equipment installed, and will be opened April 1 with about 50 men. The property consists of the plant and about 70 acres of clay and shale. The plant specializes in face brick and is the only one of its kind in Michigan, the clay deposits being the same as those in Ohio. The capacity of 50,000 brick daily will be maintained by the company. With higher freight rates the concern will be able to meet Ohio competition. There is also a substrata of coal on the property which enables the firm to supply its own fuel. The company may make building tile later. The output of the Grand Ledge plant last year was about 2,000,000 brick. The Briggs Company handles about 50 different kinds of brick besides its own product.

COAL PRODUCTION INCREASED

The output of bituminous coal during the week which ended March 5 totaled 7,406,000 tons as compared with 7,240,000 tons for the preceding week, reports the Department of the Interior show. Anthracite production totaled 1,917,000 tons compared with 1,816,000 tons for the week of February 26. The output for the coal year thus far was 497,818,000 tons of bituminous coal, or 50,000,000 tons more than for the corresponding period in 1920, while the total output of anthracite was 85,408,000 tons or 250,000 tons less than last year. The report also shows an improvement in carloads of coal shipped from the mines. There were 135,656 carloads of bituminous coal shipped the first week of March or 3,550 more than the previous week. Anthracite shipments totaled 36,651 or nearly 2,000 carloads more than the last week of February.

DETROIT RE-EMPLOYMENT LEADS

A report of the employment division of the United States Department of Labor says that in the number of men returned to jobs Detroit leads all industrial centers. A review of 65 cities with 1,423 concerns employing 500 or more men shows that on January 31 there were 1,643,253 men at work, but on February 28, the number was 1,626,958, or a decrease of 16,295, or one per cent for the month. In 36 cities there was a decrease of 60,235; in 29 cities, an increase of 43,940.

SAGINAW SHIPBUILDING ELECTION

The Saginaw Shipbuilding Company, Saginaw, has elected the following officers and directors: President, Charles W. Stiver; treasurer, Walter C. Hill; secretary, James M. Birss; chairman of the board of directors, William J. Wickes; directors, Otto Schupp Charles W. Stiver, O. L. Dittmar, George H. Hannum, Charles T. Kerry, Benton Hanchett, Henry T. Robinson, John J. Jeffers and Walter C. Hill.

FORD NEGOTIATIONS DENIED

A statement has been issued by the Michigan Iron & Chemical Company, which owns the Boyne City Chemical Company and the East Jordan Chemical Company, to the effect that no overtures have been made to Henry Ford for the sale of its Michigan plants, contrary to the reports which originated, it is said, from Manceiona.

TWIN DIE PRESS PERFECTED

The Richards Brothers Die Works, Detroit, has perfected a twin screw press for trying out sheet metal dies of all kinds. One is being used in the plant and can be operated by hand or power. A pressure of 400 tons is claimed for it.

CASE COMPANY CUTS PRICES

The J. I. Case Plow Company has announced a cut of 15 per cent in the prices of all its products.

PACKARD TO BUILD BUSES?

There seems to be a possibility that the Packard Motor Car Company, Detroit, will build motor buses. Inasmuch as the company is a big producer of trucks, it would not be surprising that it would also add buses to its regular output. The reason for assuming the above is that, according to the Saginaw News Courier, N. J. Ockersyder, transportation engineer for Packard, was requested to go to Saginaw to confer with the mayor on the resumption and completion of the proposed survey of Saginaw's transportation problems. It appears that the Packard company some time ago requested and was given permission to make a survey to determine whether street cars or motor buses would more adequately fill the needs of the city, reports the Saginaw paper. The company also promised to send a new motor bus, with special body for demonstration, and offered to turn over the bus' receipts to the Welfare League. The work apparently was started, but was held up or dropped without any explanation to the council. Labor bodies petitioned the city council to ask the company to complete the survey, and Mr. Ockersyder's communication, announcing plans to resume, came as the answer to the city clerk's letter informing him of the council's action.

THE SHOW AT ST. JOSEPH

The first successful motor car show ever held in Berrien county, says the Benton Harbor News-Palladium, was that at St. Joseph last week. It was promoted by the Twin City Automobile Dealers' Association—those from St Joseph and Benton Harbor. Among the vehicles shown were the Packard, Hudson, Essex, Paige, Handley-Knight, Maxwell, Chalmers, Oakland, Auburn, Oldsmobile, Apperson, Mitchell, Buick, Cole, Hupmobile, Chevrolet, Reo, Dodge, Studebaker, Ford, Commerce, Republic, Federal and Nash. This includes both passenger cars and trucks. In addition, there was a good display of accessories.

CHANDLER'S BUSINESS

The Boston News Bureau says concerning the business of the Chandler Motor Car Company, Cleveland, O.: "Chandler shipped 789 cars the first two months of this year and for that period earned about $56,000 after all charges. Expectations are that March shipments will be at least 900 cars and earnings for the full quarter should approximate $450,000."

WADDELL JOINS DURANT MOTORS

W. C. Durant, president of the Durant Motors, Inc., has engaged the services of Capt. Al. C. Waddell as advertising manager and representative on the Pacific Coast. Capt. Waddell has been advertising manager of the Chevrolet interests on the coast.

GOODRICH SALES FOR 1920

During 1920 the B. F. Goodrich Company, Akron, recorded sales totaling $150,007,345, or $8,663,926 more than in 1919. Manufacturing expenses amounted to $142,259,719, or $20,671,454 in excess of those of the previous year, so that the net profit from the sales was $7,755,626 as compared with $19,764,154 in 1919; $21,313,857 in 1918, and $14,878,674 in 1917. After adding other income and deducting depreciation charges, foreign exchange loss, the net profit before taxes, was $931,248, compared with $17,304,813 in 1919; $15,637,114 in 1918, and $10,544,677 in 1917. After taking care of preferred and common dividends, the balance sheet shows a deficit of $5,371,792, compared with a surplus of $12,657,813 in 1919, $11,452,114 in 1918, and $6,296,677 in 1917. The sum of $8,000,000 was added to the reserve for contingencies of $2,000,000 provided out of profits in prior years, leaving a total reserve on December 31, 1920, of $10,000,000 to cover possible losses on future commitments and contingencies.

PIERCE-ARROW COMPANY

Net profits of $1,769,914, after deduction of taxes, were earned by the Pierce-Arrow Motor Car Company in 1920 compared with $2,491,070 in 1919. Net earnings after dividend on preferred was equal to $3.88 per share on the 250,000 shares of no par common stock. In 1919 net was $6.75 per share. Surplus at end of 1920 was $4,541,545 against $3,571,631 at the end of 1919.

FORD ORDERS MORE AUTO FRAMES

The Parish, Bingham Company, Cleveland, O., has received an order to release 45,000 automobile frames for the Ford Motor Company for March delivery. The February order was for 15,000 frames only.

GOVE CO. STARTS PRODUCTION

The Gove Motor Car Company announces that it will begin production of a 2½ ton heavy duty truck and a five-passenger light six car in its plants at Brighton, Mich.; Reno, Nev., and Tilbury, Ont., within a short time. The officers recently elected are: President, H. E. Gove; vice-president, D. H. Gove; secretary-treasurer, H. K. Wolfson; directors, Robert M. Drysdale and H. D. Hansen.

TRUCK DRIVERS' BUREAU URGED

The Detroit Automobile Club and the police department favor the organization of a bureau to keep records of all motor truck drivers. It is said by the traffic officials that trucks cause three and a half times as many accidents as passenger cars.

PEERLESS TRUCK INCOME

Net income of the Peerless Truck & Motor Corporation, Cleveland, for the year 1920, after deduction of taxes and interest totaled $1,063,306, compared with $872,454 in 1919, and $773,986 in 1918. This equalled $5.31 a share, compared with $4.36 the year before. Net sales totaled $14,919,065, compared with $12,928,601 in 1919, and $11,890,079 in 1918. Surplus was $5,602,577, compared with $5,259,600 in 1919, and $4,588,972 in 1918.

SIMONS COMPANY PROMOTES PAIGE

E. R. Paige, who has been manager of the wholesale department of the Simons Sales Company, Detroit, distributor of Willys-Overland cars, has been made general sales manager and placed in charge of three branches of the company in Detroit and vicinity.

FORD PICKS FOREIGN SALES AGENT

James J. Harrington, formerly of Cincinnati, has been made supervisor of foreign sales for the Ford Motor Company and will have headquarters in London, Eng. William Knudson, executive in the production department of the Highland Park plant, has resigned.

Rueschaw Addresses Reo Dealers at Detroit Dinner

The motor car producer having a strong, time-tried and cohesive selling organization in the field is he one which will be able to find business in such times as these. The quality of product, the methods of the factory sales manager and frequent gatherings of dealers for social as well as business purposes are what keep a solid, efficient sales organization together.

Judging from the remarks of R. C. Rueschaw, sales manager of the Reo Motor Car Company, Lansing, who spoke at a dealers' dinner in Hotel Statler, Detroit, last week, he has endeavored to build up such an organization and has succeeded well. One of his statements was to the effect that if there was a depression in motor car business, so far as the Reo company was concerned, it was largely hearsay. Of course Mr. Rueschaw knew there was a depression, but he desired to impress the dealers with the fact that their company had been doing business right along as a result of their efforts and the company's conservative policy of trying to build cars according to quality, rather than quantity rules.

This point was illustrated in motion pictures in two parts. The first section was more in the line of a comedy showing the trip of a motion picture camera to a motor plant where the business principle was making cars as cheaply as possible and in as large quantities as possible; where labor was selected at the lowest price without regard to skill, and where the stockholders were not motor car builders, but merely investors interested in profits and not in mechanical matters.

The second half of the picture told the history of the Reo company, bringing out sharply the fact that the plant officials were stockholders and associates of many years' standing, in whom the pride of accomplishment and interest in the industrial success of their home state exceeded other considerations.

In the course of his talk, Mr. Rueschaw said that while at the Kansas City automobile show he saw an interesting experiment made. One of the exhibitors sent a representative around to the various exhibits, and in only two of them was the representative approached by a salesman with a selling talk.

"I believe," said the speaker, "that the best salesmanship presupposes every person to be a car prospect. At any rate it does no harm to talk motor car to every person in your exhibit whether the person looks like a prospect or not."

Another experiment mentioned was tried by a dealer handling both passenger cars and trucks. This dealer obtained the services of high school boys to take the names and addresses of every user of horse-drawn vehicles seen on the streets of the city. These names were turned over to the sales department and canvassed. The boys were paid for their services and invited to the show.

"The adoption of such a method not only provides a prospect list, but it encourages the development of future motor car salesmen," Mr. Rueschaw said.

GRASSL DIRECTS REPUBLIC SERVICE

Contrary to previous announcements, H. Y. Grassl will continue as director of service for the Republic Truck Sales Corporation.

FISK PLANT ON FULL TIME

After cutting wages 10 per cent the Fisk Tire & Rubber company, Chicopee Falls, Mass., increased from three days a week to full time for all employes.

KEEPING HIS PLANT BUSY

Henry Hammel, president of the Northern Furniture Company, Sheboygan, Wis., was in Grand Rapids recently, reports the Grand Rapids Press, in furtherance of an unusual plan by which he has managed to keep his plant, employing 800 men, working full force five days a week. He has overcome the reluctance of country dealers to order by distributing large quantities of catalogs among them and advising them that orders of even a single piece of furniture will be accepted. Dealers then ask their customers to make selections from the catalog and they order what the sale calls for, and no more.

CRATER RAZOR CO. INCORPORATES

The Crater Guarded Razor Company, Constantine, Mich., has been incorporated under the laws of Vermont for $1,000,000. A full line of straight-edge razors will be manufactured. The officials of the company are: President, W. S. Crater; vice-president, Frank C. Dunbar; secretary-treasurer, W. S. Newton, all residents of Columbus, O. The general manager is O. E. Crater, Constantine, while R. C. Schellenharger, Pontiac, is a director. It was stated that while the factory will remain in Constantine, the general offices will be in Columbus.

Substitute Measure On Trucks Prepared

[By Staff Correspondent]

LANSING, March 23.—The first meeting ever held of cartage men from all over Michigan assembled at Lansing today to protest to the House Committee on Roads and Bridges against House Bill 323 introduced by Rep Strauch, of Shiawassee county. The bill would put motor trucks and buses under control of the Public Utilities Commission and tax them 5 per cent on gross revenue.

The protests pointed out that the bill was discriminatory since it exempted from its provisions the vehicles owned by corporations and used in their private service. It was emphasized that the trucking industry was very new, having been developed since the war, and should not be strangled by taxation before being put on its feet. Figures were presented showing the extremely narrow margin of profit from trucking operation at present.

Speakers told of new bus lines that served rural communities where there were no railroads or interurban system, that would be hit, and the movement of perishable commodities was cited to show how the trucks could serve if given opportunity to develop.

The result of the meeting was to prepare a substitute measure for the committee, which was commenced at once. About 75 delegates from all over the state attended. The meeting was called by the Detroit Transportation Association and was presided over by Secretary F. L. Henk, Detroit.

OLD TIMERS MEET APRIL 2 AND 3

The first meeting of the directors of the Old Timers' Club since the election of its officers during the week of the Chicago automobile show will be held in Flint, April 2 and 3, at the Hotel Durant, having been called by President Albert Champion, who is also president of the Champion Ignition Company. At this two-day meeting many matters of importance will be acted upon and the work of the organization will be outlined and put under way. Membership is reserved to men connected with the automotive industries for five years or more and more than 6,000 applications for membership have been filed. The slogan of the new association of old timers is "Good Fellowship—Good Laws—Good Roads."

STEWART WITH BROOKS AGENCY

W. J. Stewart has been made sales manager of Thomas Brooks, Inc., sales agents for the Davis Six car with salesrooms at 12942 Woodward avenue, Detroit.

Transportation

Detroit—The Michigan Central Railroad has issued notice to all its employes, except trainmen and telegraphers, that a general reduction in wages is to take effect April 16. The cut is not specified and will not be until after conferences between representatives of the workers and officials of the railroad. In the course of the announcement it is said that "since the effective date of the rates now paid, there has been a marked change in conditions and these changed conditions justify and require reduction in existing rates."

Grand Rapids—The Pennsylvania Railroad announces that Paul Jones has been named superintendent of the Grand Rapids division. He has been holding the position of superintendent of the Toledo division. His headquarters will be in Fort Wayne, Ind. J. K. Sherman has been transferred from Toledo to Grand Rapids as division engineer, with T. L. Doyle as assistant division engineer.

Jonesville—The Southern Michigan Traffic Association held a meeting here recently, at which representatives from Adrian, Coldwater, Jonesville, Sturgis and Quincy were present. President Fred E. Chambers, of Coldwater, presided. The questions of claims and of better passenger accommodations were considered at length.

Grand Rapids—A sign of business revival is noted by the Pere Marquette Railway in the resumption of shipments of gravel to Detroit and Saginaw. The gravel is to be used for construction work. The Green Oaks pits at Hersey and Wing, which supply Saginaw, are asking for cars.

Kalamazoo—Freight coming in and going out of Kalamazoo increased in February quite appreciably over January, according to the local railroad freight agents. Indications thus far show that March will be a busier month as to freight dispatch. This may be taken as a further indication that business is coming back.

Lansing—The Michigan Public Utilities Commission has been notified by a number of the small railroads in the upper part of Michigan that tariff schedules increasing their state rates by 20 per cent will be filed. The Michigan 1919 rate law provided a passenger rate of two and a half cents a mile, giving smaller roads the right to increase their rates up 4 cents, based upon their gross annual receipts per mile. Now that the federal rate of 3.6 cents a mile governs, the roads propose to base their increase upon the higher fare, which would give them up to 4.8 cents a mile.

Detroit—A new ruling of the United States Shipping Board will permit the allocation of ships to the United States Maritime & Development Company of this city for the New Orleans-Brazil trade. A former decision ruled against the Detroit interests.

Detroit—The unionized common laborers of the Pere Marquette Railroad have refused to accept a wage cut and have asked President F. H. Alfred to place the matter before the railroad labor board in Washington. The cut proposed brings wages down to an average of $3.20 a day for an eight-hour day.

Detroit—Addressing the inland waterways committee of the Board of Commerce at a recent meeting, Col. E. M. Markham, United States Corps of Engineers, in charge of river and harbor work in this territory, said that if the exporters and manufacturers of this district would unite on terminal and harbor development, Detroit could be made a great port.

Mount Pleasant—More than 100 members of the Chamber of Commerce of Mount Pleasant visited Midland last week, also meeting at the same time members of the Board of Commerce of Bay City, for the purpose of talking over matters connected with better transportation facilities between the three cities.

ADDS TO ITS LINE

The Conchoic & Joy Manufacturing Company, Lansing, has remodeled its shop and installed new machinery and will manufacture sash, window and door frames, interior finish and do cabinet work.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Kalamazoo—Charles B. Hays has organized the Hays Home Building Company to construct homes and attend to all the details from plans to building. A. M. Worthington heads the architectural division; E. J. Stevens, the civil and structural engineering department; H. F. Young, the contracting department, and W. C. Hunting, the business and accounting division.

Grand Rapids—John H. Loomis, who has been manager of the terminal elevator plant of the Gleaners' Clearing House Association in this city, has resigned to go into the business of manufacturing fruit baskets and containers. He will build a plant in Ludington.

Detroit—An offer of land has been made to the Cerutl Aircraft Corporation, which is considering the erection of an aircraft plant near the proposed Russel Municipal Aviation field.

Chicago—The nineteenth annual meeting of the National Lumber Manufacturers' Association and the Third Annual Lumber Congress will be held here from March 30 to April 3. The new bureau of wood utilization and waste prevention will make a formal report.

Detroit—A new factory building is being erected in this city for the Spietz Cigar Company. It will be three stories high and solid brick construction.

Lansing—Contracts for 70 miles of paved road will be awarded April 1 by the highway department. These roads are located below the Straits. Work on roads in the Upper Peninsula will be started later. These plans are being made in anticipation that the Michigan legislature will pass a bill raising the interest rate from 5 to 5½ per cent on highway bonds amounting to $2,000,000 for highways for which Federal aid will be allowed.

Portland—Work on the foundation of the Western Oil Company's $25,000 building will be started at once. The start had been delayed until the automobile business gave sign of revival.

Detroit—A number of sub-contracts in connection with construction work were awarded by contractors during the week ended March 16. One concerned the Rouge State Bank, another a store and factory building being erected for the Federal Screw Works, another for an apartment building and one for work on six stores, six flats and six garages.

Port Huron—Port Huron is said to be one of the busiest cities in the state in the matter of building operations, and, in proportion to its size, it is perhaps the leading town just now in this line of work in Michigan. That is the opinion of P. E. Tanrath, who travels for a large roofing concern in Chicago and who has already visited several cities in the state.

Detroit—The city council has voted to cancel the contract for the construction of the sewer between Woodward and Yacama avenues because the contractor is too far behind in the work. The city will complete the work.

Saginaw—The city council has asked bids on $275,000 worth of paving work to be started in April to give employment to idle men.

Washington—There is available for Michigan road and bridge building $20,000,000 of the total amount of $622,000,000 available for the whole country for 1921 construction.

TO REBUILD CHEMICAL PLANT

Plans for the rebuilding of that part of the Delta Chemical Company's plant in Wells, was destroyed by fire, a few days ago, were started within 24 hours after the fire. The loss is estimated at $200,000 The Escanaba press quotes G. C. Craver, general manager for the company, as saying that there would be no delay in starting construction. The cause of the fire is unknown.

ALLEN LEAVES AMERICAN STATE

Fred W. Allen, who has been manager of the foreign department of the American State Bank, Detroit, for the last year and a half, has resigned. Mr. Allen came to Detroit from the First National Bank of Chicago, with which he was connected 17 years. It is understood that details of a new connection will be made public shortly.

TEXTILE PRICE SITUATION

Until labor and manufacturing costs are reduced the prices of textiles will not be reduced further, according to Frederick Stockwell, of Edson, Moore & Company, who addressed the semi-annual meeting of the Michigan Retail Drygoods Association, Detroit, last week. Mr. Stockwell said costs of raw materials had been cut, but manufacturing costs were still too high.

HENDRICKS LEAVES KING CO.

R. G. Hendricks, factory manager for the King Motor Car Company, has resigned.

RALSTON-NOLAN LAND TAX BILL

The National Committee of Manufacturers and Merchants on Federal Taxation, from its Chicago headquarters, sends out the report that 26 000 business concerns and 144 commercial organizations are backing the Ralston-Nolan bill (H. R. 12,397), providing for a tax of one per cent on the privilege of holding land and national resources valued at more than $10,000, which, it is claimed, would produce a billion dollars in revenue to take the place of revenue derived from excess profits and other business taxes.

Notice!

The old Briscoe factory and office building, between Woodward and Cass on Baltimore, being wrecked.

BUILDING MATERIAL GOING CHEAP

Save thousands of dollars on your new building; 1,000,000 brick, 2 and 3-inch white pine joists, steel, pipe, radiators, doors, windows, vault doors, flooring, factory doors, windows, sinks, pipe coils, gas and electrical fixtures, timbers, etc., at lowest prices.

Detroit Vortex Club Has a Busy Season

One of the livest commercial exchange organizations of Detroit is the Vortex Club, which, like other organizations of its kind, is comprised of one man from each line of business, each trade and each profession.

The Vortex Club of Detroit has 245 members. They hold a weekly meeting on Wednesday noon at the Fellowcraft Athletic Club, at which meeting the members are privileged to hear addresses by various prominent men of Detroit and other cities. Every week day, except Wednesday, a private dining room is reserved at the Detroit Board of Commerce for the use of the Vortex Club members. These luncheons are always well attended.

The purpose of the Vortex Club, as in the case of other similar organizations, is an interchange of business among members and also an exchange of business information.

A number of club activities have been planned for the remainder of the present year. These include a dinner dance at the Loschmoor Club on April 7, and 12 other events up to June 9. On this date will held the annual excursion of the Club to Tashmoo Park. For this purpose the Steamer Greyhound will be chartered. Although participation in this pleasure trip is limited to members of the Vortex Club, their families and friends, it is expected that more than 2,500 will attend.

The officers of the Vortex Club are James Purkis Sharpe, president; George C. Becker, first vice-president; Henry C. Russell, second vice-president; Harry F. Wunderlich, secretary; Paul H. Benzien, treasurer, and Jules H. Crohn, sergeant-at-arms. The board of directors includes Harry W. Rapp, George Wood Hays, George W. J. Linton, Dr. Claude W. Moore, and George T. Whitney.

President Sharpe of the Vortex Club is the Michigan distributor for the Safe-Cabinet Company.

The Vortex Club of Detroit has an official monthly publication called the "Vortexian." This is a four-column, 24-page magazine, of which Melvin Lewis Burdick is editor-in-chief. The office of publication is at 49 West Forest avenue.

WHAT PONTIAC HAS DONE

C. W. Otto, of the Board of Commerce of Pontiac, was the guest of honor recently of the St. Johns Commercial Club, St. Johns, and impressed his hearers by his views on organization and co-operation in municipal betterment efforts. Mr. Otto told how the city of Pontiac, through the Board of Commerce, induced the Grand Trunk Railway to spend $1,125,000 in improving facilities in the city and how by organizing a mortgage investment company the city built 1,500 houses in one year and then was rewarded when the General Motors Corporation spent $1,000,000 in building additions to one of its plants.

GREAT LAKES DREDGE & DOCK

The position of the Great Lakes Dredge & Dock Company, according to Chicago advices, is very favorable. The company is said to have five and a half months' work ahead on old contracts. Capital stock is $6,000,000, without bonds, preferred stock, notes or bank loans. The company has $3,200,000 cash, and since the annual statement was issued showing $1,400,000 of city warrants, $8,000,000 of city funds have been approved, so that these warrants will be paid in cash immediately, making total cash resources of $4,600,000.

TURNING OUT ITS NEW PRODUCT

Work has been started by the United Engine Company, Lansing, on large orders for its new electric clothes washing machine. According to Charles L. Sprinkle, president and manager, the orders come chiefly from eastern points.

When purchasing cutters, bear in mind that —

DETROIT, SATURDAY, MARCH 26, 1921

Ground for Hope

As Dr. Munyon used to say in his oft repeated advertisement, "there is hope." Perhaps no state has indulged in so many vagaries of legislation as Wisconsin. Out of the hopper has come some very good legislation, from which other states have patterned their own, but a whole lot more of it has been harmful; has been of the type that may generally be classed as LaFollettism. A very large amount of it has been labor legislation, conceived by men who were exploiting labor, growing out of no honest economic demand for the improvement of the conditions either of work or of workers, and enacted in the spirit of experiment, regardless of results while the experiment was being carried on. Much of this legislation was socialistic in its economic aspect and was directed against the industrial cities of the state. For be it known that where we to the east of the Badger State have looked upon its leading industries as being beer making and dairying, Wisconsin follows very closely after Michigan in the scale of industrial performance.

Kenosha, Racine, Janesville, Beloit, Fon du Lac, Lacrosse, Madison, Eau Claire and Superior are proud little industrial centers, which while easily led in productivity by Milwaukee, contribute immensely to the wealth of additional machinery, furniture and textiles with which the country is annually endowed.

The harmful legislation has been usually put over by the so-called labor interests, log rolling with the farmers. The farmers had their own axes to grind and were quite willing to have labor turn the stone during the process, they in turn accomplishing the operation of the grindstone when the laborite held the blade of his axe to it. In the various legislative melees the extreme of conservatism as represented by the tiller of the soil was hooked up with the extreme of radicalism, as represented by Victor Berger's followers from Milwaukee, while the bourgeois element were as distinctly set apart as they were, on a larger scale, in Soviet Russia.

This year the unexpected has happened, and because conditions under which Wisconsin legislation has been enacted in the past are not materially different from those which have marked lawmaking in Michigan it is worth while reciting the Wisconsin experiences and drawing the lesson and extracting the consolation therefrom. The current session of the Wisconsin legislature has had before it, much to the dismay of industrial employers of labor, a measure known as the Conway Act, designed to force every mill, factory and industrial plant, except those devoted to the making of dairy products, to limit their employment of help to eight hours a day. The motives of the legislation, as described by its proponents, were the usual ones of interest in the health and comfort of working people. A rather franker representative came out flatfooted and declared: "This is a boost for labor. There are two hundred thousand idle men in this state. If we force two shifts it means more jobs for more men."

It can be readily seen that so great an incentive to the members of the Wisconsin legislature to attract the votes of city constituents and so excellent an opportunity for the Wisconsin farmers to join with the laborites in the congenial job of putting it over on the cities caused much annoyance to the Wisconsin employers of industrial labor. The relief came from a most unexpected source on Tuesday of this week, the source being none other than the farmer representatives themselves. One can readily imagine the surprise of the state when a farmer representative declared: "The statement has been made that Wisconsin is a progressive state and this is a progressive measure. It is a progressive state. We have progressed so rapidly that we are trying to find a landing place. This bill is dangerous. It tends to create idleness. The more idleness we have, the more crime." Still another farmer representative reasoned that while farmer industries were exempted, they would have to pay in two ways; the one the temptation of their labor to easy conditions in the cities, the other the increased cost of factory products. And yet another farmer asked the question, if it were injurious to the health of workers to labor more than eight hours a day, why not legally prevent the farmers from injuring their health? When and whereupon the farmers slaughtered the bill in combination with the non-laborite representatives.

This experience in the Wisconsin legislature gives a ray of hope to the captains of industry, who have been harrassed by legislation devised by walking delegates and representatives or organized labor more concerned with keeping their jobs than with the enlargment of the supply of work and the increase of the fruits of labor. The men who declared against the labor legislation were not freaks. They had no new, sudden notion. They were reflecting the sentiment of the rural communities which they represent in the legislature. The fact that a break has been made in one state suggests the possibility of creating conservative sentiment in Michigan. Is there a way for industry in Michigan, the industry which makes the most immediate market for the products of the farm, which pays the largest share of the taxes, which develops and devises the creature comforts for the men and women who live on the farms, to convey its message of thrift and opposition to idleness to the farmer and have him join it in the prevention of harmful conditions? Or is it one of the fruits of readjustment that the farmer has learned that he can no longer afford to make urban labor conditions so attractive, so profitable and so non-productive that he can lay to that condition the unattractiveness of his own processes and the absence of an adequate distribution of farm labor. If the former condition be a possible one to bring about, industry owes it to itself to carry its message to the farmer. If the process of education be already accomplished, then there is ground for hope that industry can go on without the periodical creation of new legal restrictions.

In either case there is ground for hope that a betterment of conditions is at hand.

William B. Wilson Retires

PRESIDENT HARDING is to be congratulated on his prompt action in obtaining the resignation of William B. Wilson, former Secretary of Labor, as a member of the International Joint Commission investigating the proposed Great Lakes-St. Lawrence Deep Waterway, with the presumable intention of reinstating former Senator Obadiah Gardner. Everyone who likes fair play hopes that Mr. Gardner will be reappointed without delay.

Why President Wilson in the closing days of his administration displaced Mr. Gardner is not easily explained. The best that can be said for the episode is that it probably was the result of a whim of Mr. Wilson, inasmuch as there could have been no advantage at that time in making a change. No one ever had ever questioned Mr. Gardner's ability, and even if it had been

Digitized by Google

questioned, there could have been no wisdom in removing him at a time when the evidence in the waterways case was practically all in. His successor, no matter how able a man, could not be expected to vote intelligently, for the reason that the facts could not be as familiar to him as to Mr. Gardner. If President Wilson had wanted to take care of his Secretary of Labor, he could have found another place for him.

With Mr. Gardner back on the Commission, the latter can pass intelligently on this issue, which is of commanding importance to the country at large.

Tax Slackers

WRITING in the Annalist, C. T. Chenery brings the deadly parallel column into play to back up an observation which ought to supply food for thought for the people who are hunting for sources of national revenue. Mr. Chenery wonders whether we haven't in this country some few millions of men who despite the elaborate government machinery made and provided, are successfully dodging the payment of income taxes. If there are, and a way could be found to reach them, it would be possible to eliminate, for one thing, the excess profits taxes, which for so long have been depressing business.

Mr. Chenery makes use of figures from two sources—the Bureau of Internal Revenue, as showing the number of persons who filed income tax returns for 1918, and of the American Automobile Association, as showing the number of motor cars in use in 1919, taking the latter year on the theory that the cars were purchased from savings accumulated in 1918. The government reports show that about 4,500,000 individuals paid income taxes for the year in question, while the A. A. A. totals reveal that there were something like 7,000,000 owners of cars. There is thus a discrepancy of 2,500,000. That being the case, one of two things is possible: Either there are car owners who failed to file returns or there are persons who have discovered a system which enables them to live and own a car on an income of less than $1,000 a year, if single, or $2,000, if married. Such a system must be a wonderful thing.

As might be suspected, the figures show that the proportion of income tax payers to automobile owners is larger in the centers of population and the manufacturing districts than in the agricultural communities. Some striking examples may be seen in the following table:

CENTERS OF POPULATION AND MANUFACTURING	Automobiles	Taxpayers
Pennsylvania	490,337	518,729
New York	555,789	559,753
New Jersey	189,167	185,706
Massachusetts	288,059	209,786
Illinois	478,438	366,918
AGRICULTURAL STATES		
Kansas	288,601	64,794
Iowa	363,000	118,933
Oklahoma	151,300	46,818
Georgia	126,563	39,072
North Carolina	109,000	21,730
Minnesota	259,743	84,515

This is not hard to understand when one remembers that in the manufacturing centers the larger portion of business is conducted by corporations and partnerships whose operations and salaries and commissions paid are easily accessible to the tax collectors. In the rural districts, on the other hand, where books are seldom kept, or where those subject to the tax sometimes live remote from the internal revenue offices, it is easier to avoid payment. Our farmer friends, who are always ready to saddle as much more of the tax burden on the urban centers as they can, will do well to ponder some of the indications shown in the Annalist's article.

Mr. Chenery's conclusion is that there should be 9,000,000 payers of income taxes—about double the present number. If the federal government adopted effective measures to bring in the slackers, the burden not only would be more equitably distributed, but some of the present uneconomic tax levies could be done away with.

Short Measure Stuff

HOME BREWED EDUCATION

WE ARE TAKING a correspondence course. It is a good course and most interesting, and in a subject taught only in universities.

This is our first experience with these latter day educations a la carte and we find that they lack kick.

Education of the present is quite painless when one finds time and money to attend school in actual residence. But with a correspondence course it is different. All one can do is study and write blue books and ask questions and study some more and pay the tuition. Damme.

There are no co-eds, no junior hops, no eight o'clock classes to bolt, no yells, no athletics, no fraternities, no deans and no boarding houses. How is a chap ever going to get educated without all these things?

So we don't expect very much after we get all through. We probably will have one of these one-track minds and won't know a durned thing except what we learned. We won't ever have discovered what to do with a "soup and fish" outfit rented for commencement and there won't be any alma mater to "tap" us forever after. It's a gloomy prospect.

* * *

This is the season when the handbill squad comes to your door with kidney pill almanacs, announcements of sensational money-saving sales and short cuts across your fresh sod from the house next door.

* * *

The auto show was a success,
The best one yet by far,
And if I could have made a touch,
I'd sure have bought a car.

* * *

Clara Hamon has organized a movie company and will make pictures, but she warns us that they will be perfectly proper and Christian. Looks like she needs a better press agent.

* * *

NOTICE TO OUR COUNTRY EXCHANGES

Notify the boys back home that they'd better polish up the opera glasses that haven't been used since the last World's Fair. A New York contemporary just announces the following plays released for stock company production in the small centers of the country:

Up in Mabel's Room.
The Ruined Lady.
Daddies.
She Walked in Her Sleep.
The Girl in the Limousine.
Nighty Night.
Breakfast in Bed.

—A. F.

Brains, Such as They Are

AVERAGE men and women, says Prof. Henry F. Adams, of the University of Michigan, are only about ten per cent efficient above the neck. That may explain a lot of things that have been puzzling us, and likewise why we have been puzzled. But there is some consolation in it, too.

For one thing, it may explain some of the legislation being proposed at Lansing, where a lot of average men—very average—are in session. For another thing, it may explain why a lot of labor unionists are making it quite clear that if there is to be any wage reduction in this process of business readjustment, it will be "over their dead bodies." It also may explain some of the public utility theories of some aldermen and some newspapers, although in the case of the latter it usually is not so much a proposition of lack of gray matter as absence of scruples. It also may explain some of the ideas about government and economics being handed us by pulpit, platform and press. Indeed, Prof. Adams seems to have come upon the fountain head of most of our ills and the nostrums offered for them.

On the other hand, we may take comfort from the fact that things are no worse than they are. The world has got along fairly well to date, making a little progress here and a little there, on ten per cent brains. It probably couldn't have kept up with itself if what cogitating machinery there is had been functioning even at 50 per cent—to say nothing of 100 per cent. And again, if the general level were any higher, there would be more competition.

Those of us moderns who have wheels where something else is supposed to be ought not be discouraged. Even old Socrates was a little dippy.

FINANCIAL

The Business Outlook

By PHIL S. HANNA

ONE of the largest building financing concerns in America announces this week that it is ready to make loans for construction of dwellings and apartments. And it goes further and says publicly: "We see no reason that warrants the belief that costs are going to decrease materiinly from present levels. It is therefore our opinion that it is good judgment to BUILD NOW."

This pronouncement comes after the corporation had made a nation-wide survey which reveals n shortage of at least 1,000,000 homes and also shows reduced stocks in the hands of all manufacturers and dealers in building supplies that presages exhaustion and higher prices if anything like real activity gets under way. It is to be hoped sincerely that the prognosticator quoted is correct. Many things point this way. The announcement adds another truism—that "rents will not come down until buildings go up. This concern has financed many building enterprises and its observations, it seems, should serve as a dependable guide to the future.

Detroit will especially welcome anyone who is fain to offer us a loan. We are in many respects just as dependent on outside capital as any newly developing country. Our motor industries are still in short pants, as it were, and the more concerns like the one quoted above who come along, the better.

We haven't discussed exports and imports for several weeks, but attention is again drawn to foreign trade matters by a statement of Secretary Hoover that by March his department will put out dependable figures. This paper has dwelt for some months in the belief that there have been grave errors in the government figures, for the reason that actual shipments fell off some 60 days before the Washington figures began showing the decrease in exports. Now we have it, and therefore quote the following:

"Increased imports and decreased exports in February, as compared with January of this year, are shown by official foreign trade figures released by the Department of Commerce. Imports and exports for the eight months ended February, 1921, decreased, as compared with the similar period of 1920."

Wednesday one of the Detroit bond houses had three long distance phone calls from country banks in different sections of the state asking for paper. The total sales effected were more than $100,000, and the incident is another of those little things which show the way money matters are going in the country.

* * *

Tending to illustrate how the Detroit housewife is changing her buying habits and adjusting herself to changed conditions of purse, is the story learned today that the linling counter at one of the largest Woodward avenue stores is now doing about $200 a day, as against $100 a day a year ago. The Missus says this means that more women are making their own clothes and relining old dresses rather than buying new ones.

MERCHANDISE

	1921		1920	
	February	Eight months ended February	February	Eight months ended February

BAXENDALE JOINS DETROIT SAVINGS

H. N. Baxendale, since July, 1920, n state bank examiner, and prior thereto connected with the Detroit branch of the Federal Reserve Bank for two years, becomes auditor of the Detroit Savings Bank, April 1. His work will involve a complete reorganization of the auditing department of the bank made necessary by increased business and additional branches which have been opened recently. Mr. Baxendale obtained his banking experience in Peoria, Ill., having spent nine yenrs in the Central National Bank of that city.

Wilson Fleming, assistant cashier, takes on additional duties by becoming manager of the new business department of the bank, this department being a recent creation. Kenneth Pinton has been made an assistant cashier. He has been with the Detroit Savings Bank since 1909, having started as a messenger. For six yenrs he was in charge of branch banks, part of the time at the Clay and Oakland branch and the remainder nt the Grattiot and St. Antoine branch. He has been with banks continuously since 1909, except two years spent in the Navy. This promotion comes in recognition of his faithful efforts.

New branches of the Detroit Savings Bank will soon be opened at Hamilton and Collingwood and Junction and Warren avenues.

FIRST NATIONAL BUILDING PROGRESS

Burton Newcomb, who recently became manager of the new building in progress of construction by the First and Old Detroit National Bank, reports the steel superstructure tonnage more than 76 per cent erected. The facing work for the outside of the building, which will be of Indiana limestone, has been started and some of the concrete work on the bank vaults is under way. Fireproofing of the steel work is in progress. The steel smoke stack is keeping pace with the steelwork and construction generally is so far along that some of the electricians and plumbers and heating installers have been set to work.

This building will be 312 feet high above sidewalk, the highest in Michigan. Lot area is 21,500 square feet. Weight when completed will be 175,000,000 pounds, distributed 9,000 pounds including foundation over each foot of ground. The building will be supported on 74 concrete caissons reaching 85 feet below street level.

CONSUMERS POWER

Net income of the Consumers Power Company for the year ended December 31, 1920, as reported to the city clerk of Grand Rapids, was $1,570,600. The statement follows: Cost of properties $65,413,577.32; liabilities, bonds $34,468,000; other debts, $2,196,130.34; common stock, $14,425,900; preferred stock $13,263,000. Gross income was $9,918,736.83, plus income from gas properties of $176,980.70; less operating expenses of $6,609,856.29 and interest and discount of $1,909,251.58. This leaves net income of $1,570,600.

PERE MARQUETTE

Pere Marquette Railwny reports gross earnings of $2,404,654 for January, as against $3,116,812 in January, 1920. Net operating deficit for the month was $290,145, against $16,989 a year ago.

D. T. & I. RAILROAD

Gross earnings of the Detroit, Toledo & Ironton Railroad for January are reported as $248,425, as compared with $351,380 in January, 1920. Net operating deficit after taxes was $183,519, compared with a deficit of $63,603 the year previous.

BECKWITH'S NEW CONNECTION

Vere Beckwith, cashier of the Enu Claire State Bank, has resigned to become cashier and treasurer of the Michigan State Investment Company, Benton Harbor. The latter has resources of nearly $400,000.

NEW BRANCH PROPOSED

The Peoples Savings Bank, Grand Rapids, of which E. D. Conger is president, has submitted n proposition to the directors of the Farmers & Merchants Bank, Madison Square, to take over the building lease of the latter and to open a branch of its own in which the liquidation of the Farmers & Merchants will be carried on. While this is by process it is proposed to accept certified deposits as the basis for n loan to depositors in the F. & M. up to a certain percentage of such deposits.

BOOKLET ON EXCHANGE

Fenton, Davis & Boyle have furnished this office with a circular entitled "Foreign Exchange and Foreign Internal Bonds," which discusses clearly the reasons for the present depreciation of foreign exchange in this market and drnws some interesting conclusions in respect to these matters. One of the conclusions is given herewith: "As has been discussed heretofore it is our opinion we shall continue to have industrial liquidation nt least until we grow new crops and our market for merchandise, particularly imports, will not be good until we have created more wealth with which to purchase that merchandise."

SHERLITZ JOINS MEEKER CO.

Otto H. Sherlitz, who for five years has been assistant manager of E. W. Wagner & Company, has become associated with Meeker & Company, members of the New York Stock Exchange, Pittsburgh Stock Exchange and Chicago Board of Trade. The Detroit offices of Meeker & Company are at 256-262 Penobscot building.

PONTIAC CLEARINGS

Bank clearings in Pontiac last week were $23,791.86 less than the previous week, when total clearings were $359,238.74.

Quotes by Howe, Snow, Corrigan & Bertles, March 22.

New Export Problems

Mere order-taking in foreign trade has had its day. Though American shipments of foods, merchandise and materials over-seas continue large, exporters in every line recognize that the turn in the tide has come.

In future, goods that go abroad must first be sold. Customers must be sought, studied, served. Markets must be developed and connections formed on a basis of information and analysis even more exact than those required in securing business in the past.

In making contacts with unfamiliar markets—in keeping touch with changing conditions—in carrying out the financial or shipping operations required in over-seas transactions—the Irving's Foreign Service and Foreign Trade Divisions may be able to supply you with just the information, counsel or banking and commercial aid you need. For exporters—as well as importers—Irving spans all seas.

Michigan Bond Items

Taxpayers of the school districts of Dover, Fairfield, Madison and Seneca, Lenawee county, have voted, 62 to 24, in favor of a bond issue of $70,000 for the purpose of constructing a centralized rural high school, to be located probably in Sand Creek.

It is probable that an election will be held in Big Rapids on a proposal to bond the city for the erection of an armory.

The voters of Belding have decided by a majority of 4 to 1 to bond the town for $30,000 for concrete streets.

It was announced a few days ago at a meeting of the city commission of Grand Rapids that the question of disposing of the $355,000 of tuberculosis hospital bonds was likely to be solved through an offer made by President Dudley E. Waters, of the Grand Rapids National City Bank, to sell the paper to local investors without expense to the city.

The electors of Ionia will be asked at an election to be held probably in April to bond the city for $10,000, the additional money needed for street paving. The job will cost approximately $75,000.

REO MAKES STOCK RULING

Owing to difficulties which have arisen in cases where one of two joint owners of a stock certificate has died the Reo Motor Car Company has ruled, according to D. N. Parsons, assistant treasurer, that the survivor must exhibit evidence of transfer of the deceased's interest, executed prior to the latter's death, before a joint ownership certificate will he transferred to the survivor.

NEW LOAN COMPANY

The Citizens' Mortgage & Loan Company, Lansing, incorporated for $50,000, has leased offices and will open for business April 1. Its purpose is to care for small loans and financial needs of the public on short terms.

The officers of the company are: President and general manager, Charles A. Ferguson; vice-president, Harry J. Bond, Mason; secretary-treasurer, Miss L. M. Cook. The directors comprise the first two officers and Seymour H. Person, J. G. Reutter and Carl J. Moelter.

DECISION AFFECTS CABLE TRANSFERS

Advices from New York are that the Court of Appeals at Albany had decided that where one gives money to a bank for transfer, the money becomes the property of the bank and a debtor and creditor relation is thereby established. The court held that a trust relationship is not established and that a bank does not hold the money as agent or trustee until the foreign credit is set up. The case in question is one known as Legniti vs. Mechanics & Metals National Bank and has been in litigation since 1914. Doubtless the decision in this case will affect many other transactions now in litigation

C. P. R. EARNINGS

Earnings of the Canadian Pacific Railroad during the first week of March totaled $3,255,000, or $11,000 more than for the corresponding period last year. Total earnings since January 1 were $30,307,000, as compared with $30,571,000 last year.

U. S. STEEL REPORT FORECAST

The Wall Street Journal says that when the annual report of the United States Steel Corporation is made public in about two weeks it will show a working capital close to $600,000,000, a gain of around $367,000,000 in six years, equal to more than $72 a share on the common stock. The report also will show that the corporation has spent close to $500,000,000 for new construction and acquisition in that same period, which added to increased working capital of $367,000,000, gives a total of $867,000,000, equal to more than $170 a share on the common.

WORTHINGTON PUMP EARNINGS

Net income of the Worthington Pump & Machinery Corporation for the year ended December 31, 1920, after reserves for federal taxes was $2,030,923, as compared with $3,257,064 in 1919; $3,137,775 in 1919 and $4,432,365 in 1917. After deduction of dividends, the surplus amounted to $272,896, as against $2,246,266 in 1919. Including previous surplus, the total surplus of the company at the beginning of this year was $4,625,734, as compared with $5,852,738 the year before. Sales totaled $27,924,745, while in 1919 the figure was $32,074,592; in 1918, $43,443,485 and in 1917, $28,407,699.

PNEUMATIC TOOL STATEMENT

The annual statement fo the Chicago Pneumatic Tool Company for the year which ended December 31, 1920, shows surplus of $1,273,061 after deduction of taxes and all charges, which is equivalent to $9.87 a share on the capital stock of $12,897,900, compared with $7.65 a share earned in 1919 on a capital stock of $6,448,800. In the statement to the stockholders, H. A. Jackson, president of the company, says: "Net sales for the fiscal year while suffering from the depression felt about the middle of the year, still slightly exceeded those for the year preceding. While the gross earnings show a decrease from the previous year, the discrepancy is accounted for by the continued increase in the cost of manufacture, and the larger proportionate sales of the less profitable varieties of the company's products."

MR. ZINKANN'S CAREER

Sidney H. Zinkann was born in Wellesley, Ont., November 15, 1880. Went to school at Kitchener, Ont., and started in 1906 to work for the Canadian Express Company, at London, as a clerk. In 1909 he was made cashier of the London office and in the same year was moved to Windsor in a similar capacity, at which office he was afterward made agent of the company. He left Windsor in July, 1913, and came to the Dime Savings Bank, Detroit, with which he remained until August, 1919, having risen from clerk to assistant auditor. From the Dime Savings he went to the Commonwealth-Federal Savings Bank as general utility man, which connection he held until December 1, 1920, when he joined Walter G. Toepel in organizing the Continental Bank, of which he is now assistant cashier.

SIDNEY H. ZINKANN

Mr. Zinkann has been active in the Detroit chapter of the A. I. B. and is at present a member of the board of governors of that body. He is also secretary of the Junior Bankers' Club of Detroit.

LIFE INSURANCE LOANS HIGH

An interesting feature of the annual statement of the New York Life Insurance Company as of January 1, 1921 is the fact that total payments during the year to living policy holders were more than twice the payments to beneficiaries. The former was $79,395,838 and the latter $35,453,758. Officials of the Ohio Life Insurance Company state that no doubt a compilation of figures for all the life insurance companies will show similar tendencies during 1921. For a time they say it seemed as if every policy holder was trying to borrow on his contract. Loans on Policies as shown by the New York Life statement are $147,499,247 out of total assets of $966,644,397.

FIRST & OLD TAKES COUNTY BONDS

The First & Old Detroit National Bank purchased $2,000,000 worth of Wayne County bonds March 17, which were offered by Auditor William Gutman. The issue bears 5½ per cent. Proceeds will be used for the new bridges crossing the River Rouge at Jefferson avenue west and Fort street west.

	15,872,940	
	8,292,643	
Plus Net Earnings	5,174,404	*6,462,806
Surplus at end of period	13,467,048	24,165,583

* Less adjustments.

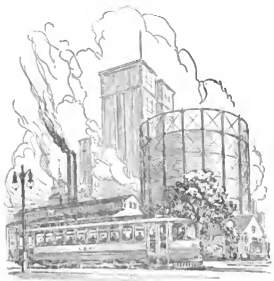
Net earnings after expenses and taxes were $9,832,054, or more than $15 per share on the $60,000,000 common stock after allowing for preferred dividends. In 1919 net was $28.54 on $30,000,000 common stock.

Excerpts from President Erskine's report follow:

"Demand is quite heavy from all sections except in a few spots. In a number of places it is double and treble what it was last Spring. March sales probably will exceed 5,000 cars. Manufacturing schedules call for 5,235 cars in March, 5,440 in April, 7,015 in May and 7,320 in June. If general conditions become no worse business should exceed that of last year."

HANCHETT OFFERS ARKANSAS BONDS

Hanchett Bond Company, Chicago, is offering $350,000 Benton County, Arkansas, road district bonds, bearing 6 per cent interest due serially, on a basis to net from 6½ to 7 per cent according to maturity selected. Benton County is said to be the banner apple producer in the United States. Assessed valuation is more than $3,000,000 while the total debt is the amount of this issue, $350,000.



DETROIT TRUST CO. BOOKLET

We have been favored with a copy of a recent booklet published by the Detroit Trust Company, which contains a thorough-going explanation of how the corporation department of the company serves the public. The department is divided into three divisions: Managerial, insolvency and service, and the layman may obtain a splendid conception of the workings of a trust company by perusal of this booklet.

No. 3 of a series of Examples

When a stockholder claims to have lost or destroyed his certificate is the corporation obliged to issue him a new one?

Yes, upon the stockholder making proof as to the loss or destruction and furnishing satisfactory bond of indemnity, for the issuance of a new certificate does not relieve the corporation from liability in damages to a person to whom the original certificate has been or shall be transferred for value, without notice of the proceedings or of the issuance of a new certificate.

Our familiarity with these matters enables us to handle them promptly and satisfactorily to both stockholder and corporation.

This service is of great value to corporations and involves only moderate cost.

FOREIGN TRADE BANK PROGRESS

The organization committee will seek an amendment to the Edge act which will permit the directors of the new Foreign Trade Financing Corporation to call for installments on capital stock payments at such times as future business demands greater capital. It is expected that such an arrangement will encourage the taking of stock by many corporations that would not be in position to subscribe if the arbitrary provisions of the present law had to be followed.

BARBER GOES TO MONTGOMERY

E. W. Barber, formerly assistant cashier of the First State Bank of Camden, Mich., has been elected cashier of the Montgomery State Bank, Montgomery, succeeding E. C. Corbett, who has returned to Reading, Mich. Mr. Corbett is vice-president of the State Bank of Reading.

GRAND RAPIDS CLEARINGS

Clearings of the Grand Rapids banks for February were $20,102,270, as against $26,316,590 for February, 1919, a shrinkage of 23.5 per cent.

A LIST of the bonds we have selected to sell can, after all, only *suggest* a choice to you. The *individuality* of any one of them, its appropriateness to your own investment plan, will not be disclosed except by a detailed examination of its essential features.

Besides the price, yield and maturity, you want to know the history and character of the issuing company, the qualities of the article or service it sells and the permanence of the demand for the company's product, whether it be a commodity or a service. Other inquiries may occur to you.

Right at this point our organization becomes necessary to you. Before we purchased the bonds we have to sell we completed the very examination you are now contemplating. Giving the benefit of this knowledge, as well of our entire experience in bond buying, is a service we offer you freely and gladly. On our list of good bonds is one *best bond* for you. We can tell you, after we know your investment needs, which one it is. Your inquiry on any phase of bond buying, is our opportunity for service.

OCCUPIES ITS NEW BUILDING

The Farmers & Mechanics Bank of Grand Rapids this week moved into its new building, which is located on the site at the corner of Main and Huron streets which the bank has occupied for many years. The old structure for some years has been too small to accommodate the growing business of this institution and the problem was solved about a year ago when the bank purchased an adjoining building formerly occupied for a long period by Dawson Bros. drug store. The formal opening and dedication of the new quarters was held Wednesday evening, when the doors were thrown open to visitors from 7:30 to 9 o'clock.

The Farmers & Mechanics bank has had a rapid growth since its organization in 1882. The original building soon proved inadequate, so it was found necessary to remodel it in 1901, but this improvement was not long sufficient. From totals of $700,000 in 1901 the bank has grown until resources are now more than $2,600,000. H. A. Williams is president; J. E. Beal, vice-president; G. W. Millen, vice-president; F. T. Stowe, cashier, and E. L. Jenkins, assistant cashier.

PRIVATE BANK CLOSED

The Farmers & Merchants bank of Madison Square, Grand Rapids, which closed its doors 10 days ago as the result of the withdrawal of deposits, and which last Saturday sold its building and fixtures to the Peoples Savings Bank of Grand Rapids, has made an assignment to the Michigan Trust Company for the benefit of depositors. The bank was a private institution. No estimate of the inefficiency of the assets has been made, but it hoped that recourse against the owners of the bank will enable the receiver to pay depositors in full.

OTSEGO FURNITURE CO. RECEIVERSHIP

The original issues of preferred stock being retirable, the directors of the Otsego Furniture Company have voted to dissolve the company. H. L. Johnson, Kalamazoo, and H. D. Lanz, Otsego, being appointed receivers by Judge O. S. Cross, of the Allegan circuit court, in which the petition for dissolution was filed. Reorganization of the company is to follow the conclusion of receivership proceedings.

STANDARD PARTS FINANCING

A report was current in Cleveland a few days ago that the Standard Parts Company's reorganization plans were taking a new turn. It was said that the new plan is to refinance the Standard Welding Company, the Perfection Spring Company, the Bock Bearing Company, Toledo, and the new Eaton Axle Company along separate and original lines and in a way independent from each other. Nothing officially has been given out.

NEW BUILDING OCCUPIED

The Farmers and Mechanics Bank of Ann Arbor has moved into its new building located on the same site.

STOCK SALE INJUNCTION ASKED

Efforts of the City Trust & Savings Bank to sell four and one-half shares of stock owned by Jennie Lamos, Grand Rapids, to force the collection of a 100 per cent assessment against the stock to cover the defalcations of Fred W. French, former cashier, has resulted in circuit court injunction proceedings.

That officers and directors already have made good the losses is the claim. In view of this condition the need of the assessment is denied by the petitioner. The bill shows that upon the petitioner's refusal to pay the assessment when made, under the banking laws the bank made preparations to sell the Lamos stock in order to obtain the necessary funds.

The bill also alleges misconduct in office on the part of the officers and directors of the bank in not discovering and stopping the defalcations. In this respect and in view of the fact that a Lamos victory probably would enable other stockholders to regain the assessments which they have paid in, the case will act as a test action on the relative financial responsibility of bank officers and bank stockholders in cases of this nature. The date for the hearing on the permanent petition has not been set.

ANOTHER MEANS & WADE BANK

The latest addition to the Means & Wade string of banks is the new Strathmoor State Bank, at Grandy River and Westlawn avenues. This community has had a rapid growth and the faith of the bankers in its future is evidenced by the handsome building erected. The exterior walls are constructed of a warm buff face brick and select Indiana limestone. The floor and wainscoting of the lobby is of Hauteville marble tile construction, set off by a verde marble base, while the dome-shaped ceiling with its ornamental plaster panels is very attractively decorated. The tellers' cages are constructed of bronze mesh and channel iron, the fronts being of wrought bronze and plate glass. The rooms are equipped with every modern convenience for carrying on the banking business, including safety deposit vault and boxes for rental to customers. There is a room which will be available for use of neighborhood organizations which may desire a place to congregate.

The organizers of the bank are Howard C. Wade and James H. Means, of Means & Wade, investment bankers; George H. Kirchner, president of the First State Bank of Detroit, and John S. Haggerty, banker and brick manufacturer. Capital stock is $25,000 and surplus, $5,000. The bank plans to open within two months.

Other banks in the so-called Means & Wade string are the Rouge State Bank, the Halfway State Bank, Halfway, and the Ecorse State Bank.

Another new building recently finished is the permanent home for the Rouge State Bank, West Jefferson and Linden avenues. The building is of much the same high-grade finish and accessories as the Strathmoor bank and also has safety deposit box conveniences. Edward T. McLachlan is cashier. Capital and surplus February 21 was $60,000 and total deposits, $344,797.92.

New Publications

INCOME TAX PROCEDURE

Distribution is being made by the Roland Press Company, New York, of the 1921 edition of Income Tax Procedure, by Col. Robert H. Montgomery. This work is in three volumes. The first deals with federal income tax procedure and is in four parts. Part 1 covers application and administration; two, all phases of income; three, deductions, and four, special classes of taxpayers. Summaries of decisions and a complete cross index for reference use are features.

Volume 2 is entitled "Federal Excess Profits Tax Procedure," and covers preparation of returns for corporations subject to the excess profits tax law. There are twenty chapters. The third volume is confined to the New York state income tax.

One feature of value is the illustrating of all tax forms of every nature, covering not only report blanks but forms to be used when applying for relief or deductions of any kind.

Col. Montgomery is one of the leading accountants and cost experts of the United States. He is a professor of accounting at Columbia University, an official of the National Association of Cost Accountants and a member of the firm of Lybrand, Ross Bros. & Montgomery.

*Includes Accrued Wages.

Changes in Surplus

Balance at Dec. 31, 1919	$1,406,611.92
Net profits after deductions	445,563.65
Balance Dec. 31, 1920	$1,852,175.57

Excerpts from President Frank W. Blair's report to stockholders are as follows: "The statement shows net profits of $445,563.65 after deduction of $600,000 as reserves for Federal taxes, items due employes, amortization of plants, adjustment of inventories, etc." Net profit and loss for first three quarters was a gain of $1,200,229.69, while the last quarter showed a loss of $187,264.94, leaving profits of $1,045,563.65, from which $600,000 for reserves was deducted to arrive at a net gain of $445,563.65.

The record of production and shipment of all products in tons follows:

	Production	Shipments
Quarter ended Mar. 31, 1920	7,437,980	5,372,651
Quarter ended June 30, 1920	7,051,939	4,526,977
Quarter ended Sept. 30, 1920	8,681,607	2,218,801
Quarter ended Dec. 31, 1920	6,963,045	1,758,310
Month of Jan., 1921	503,855	1,346,847
Month of Feb., 1921	570,128	1,107,757

"At present only one Manistique and Ashland chemical plants and blast furnaces are in operation. It is estimated from these not to exceed 4,500 tons of pig iron, 60,000 gallons of alcohol and half a million pounds of acetate will be produced monthly. In the event of the depression continuing we may soon find it necessary to close the Manistique operations completely. Payrolls have been reduced 65 per cent."

DISTRIBUTED STOCK NOT TAXABLE

Judge Booth, of the United States Court of Claims, Washington, has ruled that the distribution of stock does not constitute income taxable for revenue under the income tax law. C. W. Phellis, stockholder in the E. I. du Pont de Nemours Company, sued the Government to recover $5,657 collected as income tax on stock distributed at the reorganization of the company. This was a test case involving abatement of taxes amounting to $18,000,000 on corporate stock assessed for income taxes. Judge Booth said: "It is incredible that Congress intended to tax as income a business transaction which admittedly produced no gain, no profit and hence no income."

SAVINGS DEPOSITS GROWING

Cashier Robert Y. Sheir, of the Capital National Bank, Lansing, reports that a notable gain has been made in savings deposits, the amount for the last six months exceeding that for the same period last year by $100,000.

The Beginning of A Great Business

In 1912, when the Compensation Act went into effect in Michigan, there were no records available which would give more than a roughly approximate idea of the cost of this insurance.

Naturally the stock companies, operating for their own profit, set the rates high enough to prevent any possibility of loss to themselves, figuring that if the rates proved too high they could be reduced later.

But as no provision was made for the return to the policyholder of any part of his premium should the rates prove too high, this placed upon the policyholders the entire financial burden of the experiment, with the practical certainty that the excess would show a handsome profit for the insurance companies.

Believing this to be unfair and inequitable, a small group of representative Michigan employers—eleven in all—decided to form an insurance organization of their own in which their interests would be safeguarded in every possible way, and yet would assure them that the excess, if any, would remain their own property and be subject to distribution among themselves.

In this small way began the Michigan Workman's Compensation Mutual Insurance Company.

Today, less than nine years later, the compensation insurance business in Michigan of that same company—now the Michigan Mutual Liability Company—is more than twice that of its nearest competitor — more than the combined total of its two nearest competitors.

The reasons for this wonderful growth will be shown in future advertisements in this publication. Watch for them. Read them and learn why YOU should insure in the

Mixing Politics and Commerce

(Continued from Page 6)

ing foreign markets as dumping grounds for surplus where the margin of profit in domestic trade is sufficient to cover losses in foreign trade.

Government support in foreign trade has been lacking. Take tolls on the Panama Canal as an instance. The charge of $1.25 a ton, or $25,000 for a 20,000-ton ship. Although this canal was built by the United States, its own ships must pay as much to use it as foreign ships. The elimination, or at least a modification of these toll charges for American ships would go a long way towards stimulating American commerce. Another mistake to my way of thinking is the refusal of the Government to allow the establishment of distributing stations in the Canal Zone.

Germany Forging Ahead

Land within five or six miles on either side of the canal has been declared a military reservation and no business houses or warehouses are permitted on this territory. When it is realized that the Canal Zone is a meeting point for ships from every South American port, east and west, the advantage of having distributing stations for American products along the canal can be realized. There is no highway across the isthmus for motor trucks and competition with the Panama railroad, which is government owned, is not allowed. Thus American manufacturers and shippers are given little encouragement to develop South American trade.

Germany is a competitor in foreign trade in South and Central America well worth watching. German influence is growing daily. More than any other exporting country, Germany knows how to meet the peculiar trade conditions dictated by the character of buyers. She will manufacture, pack and ship on any old specifications. Her method of market analysis leaves no stone unturned. She is generous in the support of her foreign trade agents and careful not to create antagonism by mixing diplomatic politics with trade activities. Banks and importing houses are gradually succumbing to German influence.

Income tax burdens forced upon American interests located in foreign countries are handicapping our development. England, France, Germany and other countries having trade or industrial interests in Central and South America are giving their representatives every chance to work unhampered by tax burdens with the result that their foreign interests can undersell the United States. Some remedial measures are called for and it is to be hoped that the present administration will provide them.

The conclusions I would draw from my experiences are these: There is need for a careful governmental investigation of foreign trade conditions, and a similar investigation by manufacturers who expect to engage in foreign trade. There is a need for reorganization of foreign trade agencies and consular service that will eliminate the incompetent, and replace them with well-paid, well-trained trade representatives. I do not believe manufacturers can successfully compete with other countries without having their own agents in countries they are dealing with. This representation can be accomplished by sending personal agents, or pooling interests and establishing central agencies. It is apparent that credit conditions will be improved, and the formation of the new Foreign Trade Corporation will be an important factor in promoting commerce, but such a corporation can accomplish only a limited amount of good unless the manufacturers make themselves thoroughly familiar with foreign trade, not only to guide them in manufacturing and selling, but also to enable them to check

Digitized by Google

up on the inefficiency of Government agents.

On my way home I met a business man from Buenos Aires who told me about a trade commissioner from the United States to his country. This commissioner, my informant said, lost no time in affiliating with the social life of the city in which he was located, but most of his trade investigations were made from the hotel veranda or the ballroom. As a result of his method his first report to the Bureau of Foreign and Domestic Commerce was interesting. He reported that there was little chance for American trade in Buenos Aires because the people were lazy and indifferent; that they would not work and consequently had no money to buy goods with. He advanced the theory that climatic conditions were largely to blame, as it was too hot in summer and too cold in winter.

This agent had made no effort to study the market, and there was a suspicion that through his social connections, he had been thrown into the company of some representative from some other country who saw an excellent chance to make him appear ridiculous. American manufacturers and exporters can expect little for such official representation, and only negative results from such reports.

A Motor Show To Be Proud Of

(Continued from Page 7)

line. Many manufacturers have adopted the continental, or Rolls-Royce type, of radiators. The Velie, McFarlan, Dixie Flyer, Mailbohm, Roamer, Locomobile, Saxon, Mercier, Moon and Packard exhibits seem to favor the nickeled radiator.

Monday was manufacturers' day, which was featured by the presence of factory representatives not only from Detroit but from a wide area.

Tuesday was Ship-by-Truck day. At noon a parade of motor trucks embracing every known variety of hauling unit from the three-quarter-ton delivery to the six and one-half ton heavy duty truck, formed at Canfield avenue and Woodward. From that corner it proceeded south to Jefferson and east on Jefferson to the show building. A brass band headed the procession.

Upon the arrival of the truck cavalcade at the show building, the truck division of the big floor was turned into a motion picture show for part of the afternoon.

Several thousand feet of film portraying varied uses of motor trucks, on farms, in construction work and building service, in delivery for stores and factories and in inter-city express hauling was projected on a screen. The pictures demonstrated how the motor trucks under efficient organization and handling are helping the railways out and speeding up the business of America.

A day will come when the cosmopolitan and metropolitan city of Detroit will have a regular exhibition building and when it will no longer be necessary to "hire another hall" to accommodate all the exhibitors. It is surely not out of place to comment upon this. While the dealers or distributors are generally glad to "get in" at all, they do not hesitate to tell you "on the quiet" that it is a "hell of a thing" to be unable and be with "the rest." The show management is not to blame; the whole city is. For years there has been talk about putting up in Detroit a building for exhibition and convention purposes, a sort of Chicago Coliseum or New York Madison Square Garden. But the talking is about all that has been done thus far.

TABLE PLANT AGAIN AT WORK

Work has been resumed at the plant of the Lentz Table Company, Nashville, with about 50 per cent of the normal force and under a new wage scale.

Disinterested Investment Service

Those actively engaged in the conduct of large affairs must necessarily devote a great deal of study to basic industrial and financial conditions. They often find it difficult to keep thoroughly informed regarding day to day features of many different classes of investments.

The National Bank of Commerce in New York through its Bond Department, offers to its friends the benefit of extensive experience and close studies of investment values. It is equipped to handle this class of business for them efficiently in all domestic and foreign financial centers.

Our advice and assistance in the purchase of securities are impartial and disinterested.

Life and Industry in India

(Continued from Page 9)

I hired common labor at four cents a day when I first went to India. Just before I left the wage had risen to nine cents a day. Semi-skilled mechanical helpers were getting 75 cents a day, and skilled workmen from 75 to 300 rupees, or in American money, from $25 to $200 a month, according to the character of the work and the degree of skill. Of course when you can buy a nice, tender chicken for ten cents, not by the pound, but for the whole chicken, and potatoes sell for four cents for two pounds, the wages do not seem so ridiculously small.

"Women do the same work as the men and get the same wages. They are usually the burden bearers. For instance, in the construction of a brick chimney we used women to pass the brick. A bamboo scaffold was erected by the men who laid the brick. Crude bamboo steps were erected from the ground to the first staging, and these steps were continued upward as the successive stagings were built.

"A line of women was formed from the brick pile to the first staging and up the ladder-like steps. The bricks were passed along from one to another of the women until they reached the masons. This line of humanity was constantly increased as the chimney developed, until near the end of the job the sight of that long line of women perched on bamboo rods at dizzy heights passing brick to one another was truly a picture of another age. It is the Hindoo idea of industrial efficiency.

"One custom of the Hindoo which is bound to be amusing to the American mechanic is the annual puja or "Industrial Thanksgiving," which is celebrated annually with feasting, dancing and religious rites. The purpose of the observance is to give thanks to the god of success. These natives literally worship their machines and tools. The interiors of machine shops, foundries and metal working huts are decorated with foliage and flowers. Every tool, no matter how small or insignificant, is properly decorated with garlands and worshiped."

Mr. Maxlow's staff of engineers and mechanics were all natives trained in the fine technical schools of India, one of which was located near Jamshedpur. "The Hindoo is remarkably intelligent and makes a good mechanic, but they lack initiative and creative genius. They can imitate and they have remarkable memories, but without constant guidance they are helpless," Mr. Maxlow says.

While the primitive steel making of the punjab and his sons may afford amusement by its contrast to modern methods, the craftsmanship of the Hindoo when he works with his hands and according to his lights, commands respect. Mr. Maxlow has brought back with him many specimens of this handiwork in ivory, hammered brass, inlaid work, lace, woven designs and pottery. Also the skins of leopards, tigers, small animals and reptiles which are the results of his hunting expeditions into the jungle call to mind the fact that industrial development of India must be accomplished by men who not only have the genius and daring, but who are prepared to fight the terrors of the jungle.

Copper and Brass Milling

(Continued from Page 11)

are still in existence, and in such cases when the slabs are not filed immediately and correctly, the burs on the metal are likely to cause considerable trouble in the rolling operation, as they have a tendency to crack along the edges. In order to eliminate this defect, it becomes essential to anneal this metal upon its arrival in the rolling mill.

The metal is cast by the casting shop into the various alloys and widths according to the size and mixture desired. It is received by the sheet mill in the form of a slab. Each different size bar is of a uniform average weight which varies only a few pounds one way or the other.

Upon receiving the castings, the first operation performed by the sheet mill is the breaking down process. This is a rolling operation accomplished on a heavy pair of rolls usually 20 by 36 inches. All bars, regardless of the size, are broken down to a standard thickness of five-eighths of an inch, with the exception of leaded stock, which is rolled down to a standard size of three-fourths of an inch.

After the breaking-down operation the metal is placed in the furnace and annealed, thus softening the brass so that the maximum reduction in thickness may be obtained in the next rolling operation. The roller should always study his metal and know exactly when to anneal it so that there is no danger of its cracking or breaking in the rolls.

When the metal has reached a red heat of the right temperature it is allowed to soak for ten or twenty minutes, so that the whole mass will receive a thorough annealing. When coils are being annealed, it is good policy always to loosen them up before putting them in the furnace, so that the heat will reach them more uniformly. The modern annealing furnace has two doors, one on each end, and the annealing pans are so arranged that the metal to be annealed enters the muffle at the same time that the other pans are being extracted. When the metal comes from the furnace it is artificially cooled by means of a slow, uniform spray of water.

When leaded stock is being produced it is allowed to cool off itself, as it is very apt to crack if artificially cooled; these cracks are generally known as water cracks. If the brass is to be finished soft it is allowed to cool off automatically and water is kept away from it entirely.

After the Cooling

After the slabs are cooled they are sent to the overhauling machines where a thin layer of metal is scalped from the surface, usually from four per cent to five per cent, thus removing all grit and scale, so that a fine surface may be attained free from all scratches and blemishes.

The bars are then transferred to the running down rolls, where they are rolled down to a size within two or three gauge numbers of the finished size desired. During the rolling operations the bar elongates without materially altering the width. As previously stated, in such cases where extraordinary widths are required, the bars are either cornered or cross rolled, so that the reverse condition occurs—the width increasing rather than the length. The metal is annealed and pickled once approximately every three of four passes and cut to length at a point depending entirely upon the length of the sheet or coil required.

From the running down rolls the metal is sent to the finishing rolls, where it is rolled to a finished gauge, after which it is then ready to be slitted or sheared to the specified length and width. If it is desired to have the metal finished soft, an extra anneal is necessary prior to the sheets entering the pickle solution. After being cut to the desired dimensions, the sheets or coils are then carefully inspected and packed ready for shipment.

The editors wish to acknowledge the assistance given them in the preparation of this article by A. L. Scott, industrial engineer on the staff of Lybrand, Ross Bros. & Montgomery, public accountants, Detroit. Much of the technical information in the article was written by Mr. Scott.

STREET RAILWAY SERVICE-AT-COST AND OPTION TO PURCHASE OR LEASE BALLOT

STREET RAILWAY
SERVICE-AT-COST BALLOT

No.

ELECTION OF APRIL 4th, 1921

INSTRUCTIONS: If you favor an ordinance, the title and substance of which are as follows, mark a cross (X) after the words "For the Ordinance." If you do not favor such ordinance, mark a cross (X) after the words "Against the Ordinance." Before leaving booth fold ballot so initials of inspector will appear on the outside.

(TITLE OF THE ORDINANCE)

An Ordinance to authorize and provide for the operation of one complete unified Street Railway System in the City of Detroit furnishing adequate and sufficient facilities and service to all parts of the city and all people in the city and giving Service at Cost and reserving to the City of Detroit the right to purchase or lease the same at the option of the city.

(SUBSTANCE OF THE ORDINANCE)

(1) The city lines are to be operated by a separate company—Detroit Service-at-Cost Railway.

(2) All existing franchises and rights in the city are to be surrendered except a short piece at Fort Street and the Rouge River, a piece out Gratiot Avenue and the Stephenson Line from Highland Park northerly.

(3) As the city limits are extended from time to time within a larger territory defined in the Ordinance the street railway lines in the annexed territory come under the Ordinance and all franchises and rights-of-way therein except those above mentioned are surrendered.

(4) The rates of fare are to continue as they may be on the day on which the Ordinance is voted upon until an inventory and appraisal and audit can be completed. The rates are then to be fixed so as to pay all expenses, costs and charges which the Interstate Commerce Commission in its system of accounts for street railways recognize as proper, and also such expenses, costs and charges as the city under the Ordinance may require the Company to incur and pay. In addition, the Company is to receive six per cent (6%) per annum on the value of its property which shall be used or useful in the public service. The maximum value of the property which was proposed to be transferred by the agreement with the City, of March 17, 1919, is limited to Thirty-One Million, Five Hundred Thousand Dollars ($31,500,000.00). The rates will go up or down from time to time as conditions may require—each change in the price of tickets being exactly one-half cent. If the rates at any time produce more than these requirements, the excess is put into a stabilizing fund and at the end of three (3) months the rates are automatically lowered.

(5) The value of the property and every other question which can possibly arise under the Ordinance is to be determined by a Board of Arbitrators. The Board in the first instance is to consist of five (5) members, two (2) appointed by the City, two (2) by the Company, and one (1) by these four, or if they cannot agree, by three (3) of the Circuit Judges. After the valuing of the property is completed (and it is required to be completed as soon as practicable) the Board will be reduced to three (3) members. A new Board is to be appointed every two (2) years.

(6) Extensions are to be built and additional cars provided to any extent that may be directed by the Common Council, subject to conditions as to purchase if built within the last ten (10) years. If the Company fails to proceed with due diligence and faithful endeavor it loses the six per cent (6%) until it makes the failure good.

(7) Any municipal lines—subways, elevated or surface—may be required by the city to be equipped and operated by the Company, or the Company may be required to purchase any surface lines, or if the City operates the municipal lines the Company may be required to exchange transfers or cars—that is, cars may be routed over both municipal and Company lines. All crossings of Company tracks by municipal tracks are to be constructed by the Company and the cost paid as determined by the arbitrators.

(8) The routing of cars, frequency of service, heating and ventilation of cars and all similar matters are to be prescribed by the Common Council. The Company waives any technical legal rights it may have to question such matters. The City is to have a voice in all future agreements with Motormen and Conductors, as to wages and working conditions.

(9) The City has the right to buy the property at the value shown by the inventory and appraisal at the end of any year. The City also has the right at the end of five (5) years, or of any year thereafter, to lease the property at a rental of six per cent (6%) on the value shown by the inventory and appraisal at the end of such year; the City maintaining the property during the lease which must run for the balance of the Ordinance term—that term being not more than thirty years—but may run for any lawful longer term at the option of the City, but not exceeding ninety-nine (99) years, and the City has the right to assign the lease or sub-let the leased property.

(10) A sinking fund is created out of the revenues—two per cent (2%) on the value of the property each year. This is to be paid into the City Sinking Fund Commissioners each month and is to be invested by the Commissioners in either City or Company bonds. If the City purchases the street railway system payment may be made by converting the sinking fund into cash and turning the cash over to the Company and paying the difference. At the end of the term of the Ordinance the Company is bound to leave its tracks and other property in the streets unless the Common Council requires its removal, and to convey all property to the City which the sinking fund is sufficient to pay for at the value shown in the inventory.

(11) A budget is required to be submitted by the Company to the Board of Street Railway Commissioners early in February of each year. This budget is required to cover all proposed expenditures for operating the system during that year, also all expenditures for new track, equipment, etc. The Street Railway Commission may disapprove any such proposed expenditures. The Company is limited to such expenditures as are set forth in the budget and are not disapproved by the Street Railway Commissioners except the Company may appeal to the Board of Arbitrators.

(12) The City Controller and City Treasurer are to be members of the Board of Directors of the Company.

(13) Mortgages now on the street railway cannot be renewed or extended or new mortgages put on without separating the City lines from the lines outside the City, nor can all new mortgages on the City lines together exceed eighty (80%) per cent of the value fixed by the Board of Arbitrators, and all mortgages must be payable at any time the City purchases the system.

Aladdin

Aladdin Industrial Houses Pay Manufacturers Big Dividends

THE Aladdin System of Construction saves 18 per cent of the lumber wasted in ordinary building. Standardization and quantity production further reduce the building cost approximately 30 per cent to you. Also you benefit by Aladdin's stupendous purchasing power. Aladdin houses are easily and quickly erected by unskilled labor. Simple, complete instructions are furnished with each house.

THE ALADDIN SYSTEM AND PLAN

Aladdin houses are Readi-cut. Every piece of joists, studs, rafters, sheathing, siding, flooring, interior finish is cut to proper size, marked and numbered ready to nail in place. Sufficient material to complete more than 3000 houses is carried constantly in stock ready for instant shipment. Depending upon size of house, we load from one to three complete houses in each car.

QUICKER DELIVERIES FROM OUR FIVE MILLS

Aladdin houses are manufactured and shipped direct from the Aladdin Company's own mills in Michigan, North Carolina, Oregon, Mississippi and Canada. Aladdin's Industrial Homebuilding Service means shorter routes, quicker delivery and lower freight rates for builders in every part of the United States.

When you are ready to consider your housing problem bear these facts in mind.

Aladdin—

—expedites your building project—
—houses your men well and quickly—
—saves 18% of the cost of lumber—
—save 30% of the labor cost—
—reduces the skilled labor required—
—guarantees complete shipment of material—
—guarantees the quality—
—carries material for 3000 houses in stock—
—ships from the nearest timber region—

—quotes definite prices on any order from one house up to a city of 3,000, including churches, schools, offices, water and sewage systems, electric plants, street and house lights, heating plants, street parks, trees, lawns, etc., complete.

Detroit to Build This Year, But–

The Chances Are All Against the Great Boom Some People Have Been Busy Predicting; Why?

By F. W. HERSEY

IF WISHES were fishes we'd have a feast. If all the ultra-optimistic and considerably distorted reports that run something like this—"Detroit to Have Greatest Building Boom in History"—were basically true, with this beautiful weather we are having it would be impossible to walk the streets without tripping over a pile of lumber or getting "beaned" with a falling hammer.

The building boom that so many newspapers are talking about is a state of mind—a wish expressed as a fact with characteristic Yankee exaggeration. It is the kind of a state of mind that is meat for speculation. What Detroit wants now is investors and building investments. The need of the hour is men with faith in the future of the city; men who are keen enough to know that in the future Detroit will be a greater city, a sounder city by reason of the test of economic fire through which she has passed, and knowing that, will put some money into homes for themselves or homes for others, asking only a reasonable return and having a desire to derive a small, though clean profit from what might be an altruistic act.

From such sources must Detroit look for the money that will revive building activities during this spring and summer. On the number of such men available and the amount of money forthcoming from them will depend any "boom" the city will have.

Propaganda Distasteful

Propaganda intended merely to create a phantom out of which to build fictitious values on building materials, wages and speculative investments can but meet the fate of the house built upon sand, and should be disregarded. The actual facts of the case are the rock upon which to build the foundation for the building activities of this season, and there are enough such facts existent today to justify the assurance that considerable building will be done; that there is no better time to build than now, and that money invested in building at this time will, when all business has regained its equilibrium, yield a good, steady return.

A Detroit contractor said the other day: "I do not like this building boom talk. I believe in optimism, and I know there will be a marked improvement in the building situation, but there is this about exaggerated optimism: It sounds too much like propaganda with an ulterior motive. When I hear it, I visualize a rush of building prospects, a demand for materials and labor, an almost immediate increase in the prices of both, and —a dull thud as the beautiful picture drops to the ground. The call is not for a boom, but a recovery, a gradual restoration of confidence on the part of home-owning prospects, industrial leaders with building program, and real estate investors."

This publication prides itself on its conservatism. Since last fall nothing has been said about the building industry, aside from such news matter as justified use. It has waited until this time to say a word about the industry. More than a year ago the subsequent business depression was prophesied, much to the disapproval of business men and bankers who did not believe it, or, if they did, preferred nothing be said about it. Unpreparedness made the decline all the more severe for some persons and some concerns. Those who saw the impending conditions were prepared.

Believing that there are reliable evidences of renewed building activities, the Michigan Manufacturer and Financial Record now undertakes to analyze these evidences and reach a conclusion. A recent newspaper report to the effect that there will be $75,000,000 of building construction done this season is not accepted as of any value. There may be that much construction in various stages of initial preparations, in architects' offices and in the minds of business men who are looking well into the future, but there is no evidence to support any assertion that such an amount of building will be started this season.

That there will be considerable home building, alterations, apartment house construction and industrial development is supported by some facts. There have been reductions of from 35 to 45 per cent over peak prices in some kinds of building materials. Wage reductions have been effected in certain divisions of building labor, and very probably further reductions will be made. Whether the decrease in material prices will hold any length of time depends upon the extent to which prospective builders and buyers rush into the market.

Reports from manufacturers of building materials indicate that no large surpluses have been accumulated. Simultaneously with the stoppage of construction activities, lumber mills and plants, brick works, cement works and other concerns furnishing materials closed down or curtailed production. Some of these could not afford to carry heavy inventories or sustain overhead against a dead market. Others who could have done so did not because it was not good business. Therefore, any sudden stimulation of the market beyond what the occasion calls for will result in immediate price increases, because it will take time to hire men, reorganize forces, overcome labor troubles due to wage-cutting, and get into steady, quantity production. In the meantime such surpluses as there are will be drawn upon, and very probably soon exhausted.

There are few manufacturers of building materials, or of any other products, who have not learned a lesson from over-production. Plant operations will not be entered into with superheated confidence. Instead it will be hand-to-mouth for a while at least. The automotive industry is a good example of this, for all motor plants are today buying for one, two or three months' production. Deliberate effort so to control markets as to maintain prices, on the one hand, and financial necessity, or caution born of industrial wisdom, on the other, will characterize the building development of the present year.

Another problem to be considered is the fruits of speculation. During the last two years real estate, buildings particularly, has been changing hands at a reckless rate. Some of it has been shoe-string speculation. Apartment houses, one, two and four-family dwellings have been sold for the purpose of gambling on equities. Speculative buyers went in at the top of the market and, in many cases, are sufferers thereby. Any person who travels the streets of this city now will notice the large number of homes for sale. There are streets on which almost every other house is on the market.

Sources of Money

The answer to more than a few of these offers is financial trouble. Incomes have suffered considerable defiation and property burdens are becoming heavy, with the result that sale, even at some loss, is desired. Such a condition cannot fail to have an influence on building. While the extreme home shortage in the city has been in no way relieved, the opportunity to buy without the trouble of building has some attractions. The exodus from the city by thousands of unemployed has left property on the market. The return to industrial and business activities of eighteen months ago would obviate all these conditions, but who in possession of their healthy faculties expects such a return? In Detroit there is considerable money for building investment, and there are many persons, comparatively unaffected by the business depression, who have money and definite ideas of building, but the number is not great enough to contribute to "the greatest boom in the history of the city."

There are three general sources of money for building—the banks, building and loan associations and private fortunes. In the financial situation we have a serious obstacle to a "building boom" as conceived by good wishers but slow thinkers. First we have the banks. The charge that they have deserted building, that a better attitude on their part toward the building needs of the city would soon revive construction is, we think, unfair. In the first place, Michigan is one of the few states where the laws recognize mortgages as good collateral for banks, whether the banks do or not. Because of this law, savings de-

Digitized by Google

posits have been tapped as much as safe practice permits for building loans. The best support comes from the savings banks; the commercial and national banks are more limited by law.

To the degree that employment produces savings deposits real estate loans are possible. The Michigan law provides that savings banks must lend at least 50 per cent of their deposits on real estate. Commercial banks largely support business and industry, while national banks can loan on property for one year, if it is within 100 miles of the bank, the aggregate of such loans being limited to 25 per cent of the bank's capital and surplus, or to one-third of its time deposits. These are definite limitations.

The savings banks, on the other hand, must lend up to 51 per cent of deposits, but can exceed that point and do, although it is not considered the best banking practice in all quarters. A review of bank statements shows that the savings banks have done more than their share, more than is required of them by law, and more than would be regarded as good practice in other cities, Chicago for example. One bank in Detroit has deposits of $7,000,000, and of that amount, $5,229,000 is invested in mortgages. Another bank has $3,000,000 out of deposits of $5,416,000 so invested. A commercial bank has loaned $3,466,000 out of deposits of $7,800,000. Still another bank shows mortgage loans to the amount of $24,000,000 from deposits of $54,000,000.

Assuming that the banks have done their full share and more, what can be expected of them as the spring and summer progresses? At present there is a gradual lowering of deposits. Depositors out of work, or on reduced incomes, either are not depositing as much as usual, or not at all. Thus bank income is limited. Those unemployed, or having incomes insufficient for current needs, are drawing on savings, thus increasing bank outgo. The only remedy is stricter economy on the part of depositors, re-employment for those out of work, and revival of business in general sufficient to produce larger income. If we are to accept the theory that profits must be shortened, wages and salaries reduced, then, unless new economies act to offset it, there is bound to be a shortage in deposits, which makes less money available for building.

Mortgages as Collateral

The objection to mortgages as bank collateral is their nature. They are not quick assets. The man who deposits money in a savings bank does so with the understanding that his funds will be available at any time he needs them. If, when in need of money, a depositor presented to the bank with the intention of drawing upon his savings, but instead of cash, he received a mortgage with the explanation that his deposits had been so invested and no cash was available, he might as well not have a deposit so far as his immediate need for cash is concerned. Cash he must have.

The mortgage usually represents a long term loan which the bank must be able to carry and at the same time have available cash on hand. The limitation of one year on city building loans and five years on farm loans placed upon national banks is for no other reason than to keep the banks' funds in an liquid a condition as possible. No such limitation is put upon savings banks, but their need for liquid assets prevents them from freezing too much of their deposits in building mortgages. It is known in financial circles that some of the banks will not be prepared to lend building money for another year.

The second source of money for construction is the building and loan associations, of which there are five or six in Detroit. These associations depend to a large measure upon the savings of depositors having incomes within the $5,000 range, very few above that figure. All the majority of these associations have to lend now is the money reaped on past loans. That is why so little building has been started with the general business depression. An executive of the largest association in the state says that it would be at least a matter of not two months, before loans could be made to any extent for new building. It is apparent that there are not enough of these associations in Detroit. During 1930 these organizations all over the United States financed building to the extent of $500,000,000. There are about 6,000 of them, having a membership of approximately 5,000,000 men and women, and assets totaling about $2,000,000,000.

While Detroit may be in dire need of housing and not have sufficient building loan association capital, another city may have plenty of money thus invested, but the building needs may not require it all. To make such surplus available where most needed it has been suggested that a system of government-controlled Federal Building Loan banks be established, with eleven building loan districts. In fact such a measure has been drafted for legislative action. Bonds issued through this system would be tax exempt, which provision would soon turn money now invested in certificates

(*Continued on Page 28*)

The Legislature As a Pawn

What Is the Purpose of Two Dangerous Bills Affecting Our Now Overburdened Railroads?

IS THE Michigan Legislature being used as a pawn in a larger, national, political game which has for its stake the nationalization of the railroads?" is the question which S. W. Brown, chairman of the Michigan Railroad Association, puts to the people of this state. "Two bills, in particular, are being brought to the fore, with no apparent purpose other than to make further inroads upon the railroad treasuries, already nearly depleted, while similar or related legislation is being introduced in other states," says Mr. Brown. "That the movement is a concerted one is, in my humble opinion, highly probable, and designed primarily to embarrass the transportation lines at a time which is perhaps the most critical in the history of transportation.

"Notwithstanding the fact that everyone of Michigan's railroads—or those operating in this state—has been losing money for several months, two bills, in particular, threaten to cripple these lines further. Senate Bill No. 5, which is known as the 'Full Crew bill,' and which was to come up for consideration this week, promises to add another burden upon the operating costs of the Michigan railroads aggregating an annual charge of $1,061,041, while the Vestibule Cab bill would involve a further expenditure upon all lines of approximately $5,340,156, according to an estimate based upon the provisions of the first draft of the bill, which has since been modified. But the requirements of the new draft leave some doubt, so no fair estimate can be made until the Michigan Public Utilities Commission gives a pronouncement upon what it will expect, should this measure become law.

"The full crew bill for the principal Michigan railroads will involve an additional annual transportation charge as follows:

Michigan Central	$205,158.00
Pere Marquette	162,158.00
Grand Trunk	162,186.00
Ann Arbor	60,000.00
Chicago & Northwestern	54,471.00
New York Central	53,554.00
Pennsylvania	48,000.00
Wabash	42,600.00
Duluth, South Shore & Atlantic	41,954.00
Detroit & Mackinac	36,000.00
Detroit, Toledo & Ironton	22,125.00
Munising, Marquette & Southeastern	19,643.00
Copper Range	8,400.00
Lake Superior & Ishpeming	5,253.00

"Now what does the full crew bill imply? Simply, the employment of an extra brakeman on all freight trains of more than 50 cars and all passenger trains of more than five coaches. The bill allows no leeway in the compliance with its provisions. It is mandatory. The railroads, it must be understood, endeavor to operate their trains safely, and whenever this is required, do put in such an extra man, and if this additional help were necessary at all times, he would be included; but as a matter of fact this additional man is not only unnecessary but at times may be a source of great responsibility. The state of Indiana, after 10 years of this legislation, has just repealed this bill as involving unnecessary expense upon the railroads which in the final analysis is passed on to the farmer, the producer and the consumer, without any compensating benefits. For after all it must be recalled that whatever transportation charges are taken out of transportation must first be put there through charges on the service performed, whether it be passenger or freight. These are the only two main sources of revenue for a railroad. So much for the full crew bill for the present.

"Another bill, known as the steel vestibule cab bill, was introduced at Lansing. After some discussion the bill was redrafted and it is now known as the vestibule cab hill. This, if it becomes law, provides for the installation of special steel cabs for locomotives. Figures were compiled based upon the requirements of the first draft of the proposed measure, which would have involved a capital outlay of $5,340,156. Under the new draft, the bill is indefinite, leaving the specifications to the Michigan Public Utilities Commission, and this body has not pronounced upon what it would require if it were adopted. These vestibule cabs, if constructed of steel and installed at the time a locomotive is being built, cost $2,500, while if they are installed later, the charge runs upward of $3,000 each.

"The outlay for the principal railroads of Michigan, if this measure becomes law, will be as follows:

Michigan Central	$2,604,000
Pere Marquette	1,566,000
Chicago & Northwestern	384,000
Grand Trunk	320,000
Duluth, South Shore & Atlantic	297,000
Wabash	246,000
Pennsylvania	227,000
Ann Arbor	125,000
Detroit, Toledo & Ironton	122,000
Detroit & Mackinac	100,000
Lake Superior & Ishpeming and Munising, Marquette & Southeastern	96,000
Detroit & Toledo Shore Line	66,000
Detroit, Bay City & Western	36,000

"For these improvements, too, if improvements they are, the shippers and traveling public in the end will be required to pay, under

It Was a Real Business Getter

1921 D. A. D. A. Show Very Satisfactory to Dealers, Who Report Sales and Excellent Prospect Lists

By MARC BRAUN

THE ANSWER of practically every automobile dealer or distributor as to what he thinks of the Twentieth Annual D. A. D. A. Show, which ended last Saturday, may be summed up as follows:

It was a good business show.

In many cases sales as well as prospects lined up were far beyond the number the dealers exp.cted.

The prospects listed in the majority of cases are real prospects.

It was the best managed and best arranged show the city ever had, and as for its location, it could hardly have been better selected.

As a stimulus to future business it was held just at the right time.

There is no need for much elaboration. It may be stated, however, that probably never before did this annual event attract so great a number of real prospective buyers. That is one of the outstanding observations made by the salesmen. The percentage of casual visitors and curiosity seekers was unusually low, although previous attendance records were distanced.

Sales of cars during the show are variously estimated, but whatever that number actually was—the estimate runs all the way from 300 to 700 cars—it really has no great significance. It's the sales that will be made from now on that will tell the real story of the success of the exhibit. And from what the dealers say, their prospect lists, by which they are setting unusual store, will keep them busy for several months. April, according to the men in the business, will be a very busy month for the dealers, and unless the manufacturers arrange for increased output some of the retailers venture to predict a shortage of cars some time in May. At least of certain makes.

Here are a few brief statements from dealers:

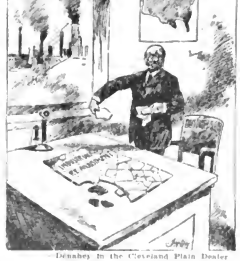
Nash Distributing Company—"It was a first-class show, a show worthy of Nash—the finest ever held in this country. We recorded 50 per cent more prospects than last year and we are satisfied with the number of cars sold. We did not at all expect the results obtained."

Bemb-Robinson Company—(Hudson and Essex)—"A very good show indeed. We sold 40 cars. Considering present conditions, that is a satisfactory record. As for the number of prospects, it is most gratifying and encouraging. We are confident of the future in our territory. And we are not given to bragging, either."

Detroit Reo Branch—"We are gratified with the show, which was in every respect a fine and dignified event. We sold cars and lined up enough prospects to keep our sales force busy for a long time. The outlook is good."

Thomas J. Doyle—(Dodge)—"Considering the fact that we are not yet back to normal after the months of depression, the results of the show are good. We sold 54 cars and have a good number of possible sales on record. The general outlook is much improved."

Detroit Packard Co.—"Yes indeed we are well satisfied. In fact, the results were better than we had hoped for, and the future looks good. We sold 19 cars and our prospect list is a mighty good one. Our sales have been increasing steadily, and while there was a time when business was rather dull, we cannot say that we ever had to close up our salesroom for lack of prospective buyers. January was a good month with us; February was a better one; March was slow in getting started, probably because of the income tax payments, but during the last ten days business has been brisk."



Knight Motors, Inc.—"This was a very, very fine show, both from the standpoint of attractiveness and as a business getter. Sales were

Darling in the New York Tribune

Thank Heavens, Mother Is Back Sooner Than Expected

very fair, and as for prospects, well, we have 409 names to take care of, and while we do not expect to make 409 sales, we figure we will get a very fair percentage. As a matter of fact, we believe that April will be a big

Dunahey in the Cleveland Plain Dealer

Almost Got It Together

month and that by the middle of May it is likely that there will be a shortage of standards cars."

Wm. F. V. Neumann & Sons—(Pierce-Arrow)—"It was a good show, well managed, well arranged, speedily located, and it was favored with what might be called a class of more earnest prospects than in many years. We sold cars and we have a good number of prospects on our books. Just a few minutes ago we sold a car to a prospect who had come to look over our display during the show, and we have another prospect scheduled to come in for a decision this afternoon. We are well pleased."

Baker-Fisk-Mugill Company—(Dort)—"The show was better than we expected. Real buyers and prospects were the majority of visitors. We are well satisfied with our sales, and as to our lineup of prospects, they will keep us hustling for some time. The show was one the city and the dealers may well be proud of."

W. D. Block Motor Company—(Marmon and Lexington)—"The best show Detroit ever had. Well arranged, and cars displayed to great advantage. Sales were made and we have a large number of prospects to look after. Are we optimistic as to the future? Well, we should say we are, and we think we are not the only ones who feel that way."

Chevrolet Motor Company—"It was a real automobile show. We sold a good many cars and we have three times as many prospects to look after as we had last year, and last year's was a good show."

Miller-Judd Company—(Liberty)—"We sold quite a number of cars and have plenty of prospective sales. The general outlook is good—certainly much better than it has been for some time. The show itself was splendid."

Detroit Oakland Company—"We are satisfied. That means a great deal now when conditions are taken into account. We sold cars and we have a fair list of prospective buyers. The show was probably the best ever staged here. May the next one be as fine."

Smith-Glines Sales Company—(McFarlan, Stephens and Kessler)—"In the 15 years we have been connected with the Detroit automobile business we have never seen a better show. Not even the two national shows surpass it. It was an excellent stimulus to the business that is sure to follow."

Simons Sales Company—(Overland and Willys-Knight)—"A fine show it was, and sure to bear fruit. It cannot be said that sales were as numerous as might be expected, but we are still convalescent. We expect, however, a gradual improvement. We have a large number of live prospects on our list now."

The general revival in the automotive industry is reflected in the greater activities in the Detroit manufacturing plants. So far as can be learned, the builders, taken as a whole, have now passed 50 per cent of 1920 average production. Progress is probably most notable at the Ford plant, which is again on a six-day basis and where the output is variously estimated at from 3,000 to 3,500 cars a day, and where, according to an official, a 4,000-a-day output will be in progress within a few weeks.

M. L. Pulcher, vice-president and general manager of the Federal Motor Truck Company, has issued a statement in which he says that the Federal has resumed a full time working schedule and is producing at 56 per cent of normal capacity. Not only that, but more than 40 per cent of the complement of men em-

Planers, Shapers and Slotters

Some Suggestions as to Their Installation and Work; Things to Be Remembered When One Is in the Market

By JOHN J. RALPH.

PLANERS, shapers and slotters are machines for producing flat surfaces with a single point reciprocating tool. In the planer the tool is held stationary and the work is moved in and out horizontally under it. In the shaper the work is held stationary and the tool is moved back and forward, usually horizontally. In the slotter the work is held stationary and the tool is moved up and down.

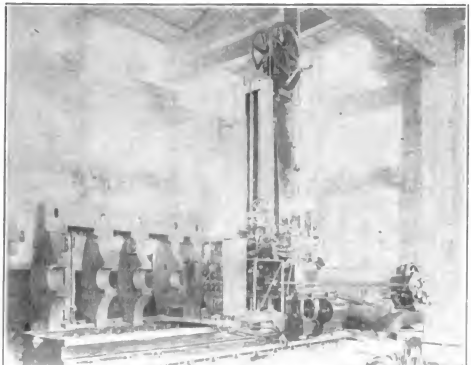
Roughly, the planer handles the outside of large work, where flat surfaces are to be generated; the shaper handles small work, and the slotter is especially useful in machining inside and end surfaces.

These reciprocating point cutters are essentially building rather than manufacturing machines—for the job that does not come through in large quantities or whose outline is so irregular that even though they come in quantities they cannot be finished on the miller or disc grinder with satisfaction.

With the development of jigs and fixtures there has been an extension of the field they are economical for, and today where there is metal to be removed from three sides of a piece, or where the outline is awkward or where the shape is elongated, with machining to be done only over part of the surface, the planer should be very carefully considered.

Fortunately these machines are made in a great variety of sizes, quality and design, so that it is possible to find just the machine which will fit the manufacturing conditions in your shop.

With all of them there has been a development, particularly marked during the last ten years, toward massiveness of design, direct motor drive, high power, fixtures and attachments to make them more versatile.



These three machines were developed by the English during the first third of the nineteenth century, so that they are now about a hundred years old. The planer was the first of these surface machining tools and the records do not show any trace of one until 1814. This was during the time that Watt was developing the steam engine and his work was badly held up because of poor or non-existing machine tools.

By 1825 the art of building planers had so far developed that Clement had completed "The Great Planer," which would take in a piece of work six feet wide, six feet high and twelve feet long. This machine was very accurate and was operated by hand power.

The shaper was invented by Nasmyth and was long known as Nasymth's Steam Arm. Six years only had elapsed, yet power drive and power feed for the shaper had been perfected. The slotter was developed before 1850, but records seem a little shy as to just when and by whom it was invented.

These first machines were extremely light, so that the cut taken was very small and the speed slow. Their accuracy, however, was better than might have been expected. It is interesting to note that the facilities in the line of attachments and movements were such that almost any kind of work could be done on them.

In 1912 there was a planer in one of the Lake shops which bore proudly cast in the cross brace the date 1837. Love of beauty and pride of product were greater then than now, for the machine was richly ornamented with roses and leaves and bore traces of gilt and many colored paints! It was actually in operation—in the shop of a company having eight different plants, and several hundred dollars had been spent the previous winter reconditioning it. This machine was the product of one of the New England machine tool manufacturers.

Morton's 84-inch traveling head planer machining a large marine engine bed casting in a Michigan shipbuilding company's plant.

The Modern Equipment

This discussion will be limited mainly to the planer because it is the most important machine of the three and the shaper and slotter have passed and are now passing through the same type of development. The shaper has probably led the way, the machine being smaller and the development costs being less.

Large planers have always been made, but not until recent years have such extreme sizes been built as to take twelve feet square between the housings and a cut fifty feet long. This is not the extreme limit, manufacturers being willing and able to give the purchaser a planer just as big as he may want to buy.

Comparing the modern planer with the old, the first impression is that of the increase in massiveness. The underpinning of the 1837 planer was somewhat similar to that of the modern sewing machine. The bed was light and the platen very thin. The housings, cross bar and cross brace were very light. The pressure on the machine's foundations carried down to the ground, deep internally braced frame, and with housings, cross bar and braces huge in size yet so designed that every ounce of metal contributes to the stiffness.

With this increase in massiveness there has gone a great increase in power. Where the old machines were operated by rather slow running belts which were not very large, today there are moderate sized planers with 25 H. P. motors directly connected and so arranged as to accelerate the cutting stroke after entrance of the tools, and cutting down the speed just before the reversal, and with a return platen speed of 200 feet a minute.

In the old days the tool barely crawled over the surface and left little more than a scratch. Today you may have five or more tools cutting at the same time on three sides of the piece. The cutting speeds may run to 100 feet a minute. The feed may be as high as 1¼ inch on cast iron. The depth of cut may vary from the finishing .010 inch to a full inch in depth. The accuracy possible with these high speeds and feeds is almost unbelievable—if the planer has been set up correctly and is itself accurate.

Choosing the Planer

In looking over the various lines of planers on the market one is particularly impressed with the variety of types and sizes to be had and the varying conditions they are designed for. There is first the standard planer with its two housings and cross bar. This may be had with from one to five toolheads and from sixteen inches to sixteen feet between housings and to take almost any length of bed.

You may buy extension housings which will stand away from the planer proper and do odd jobs, or there are machines in which one of the housings may be removed.

Where the greatest flexibility is desired there is the open side planer, which has but one upright and the cross bar is a cantilever supported from this upright.

Digitized by Google

Before going out into the market it is well to hunt up the answers to a few questions:

Just what material comes through to be planed? What is the size? Is it possible to send it through in groups so that several pieces of a kind can be planed at the same time?

What is the biggest piece that comes through? What is the smallest machine that will take it—in a standard planer—in a convertible open side planer—using an extension head—using an out-board tool post—in an open side planer?

Is the work such that only the highest grade machine can be used?

By the time you have asked yourself these questions and the others which will suggest themselves, it will be time to call in the salesmen of the different companies and see how price ranges for the different makes and what their particular selling arguments are.

The Planer in the Shop

You can put some machines in your shop and they will operate equally well, no matter how mounted. Not so the planer. Probably no other machine is quite so sensitive to the manner of mounting and the way it is handled. If properly set up and properly treated, there is probably no other which will keep in shape for the same length of time.

The setting up of a planer starts right with the foundation. The frame of none except the very smallest is sufficiently rigid to be independent of the foundation, and the alignment and accuracy of the entire machine is dependent upon it.

Taking, as an example, a medium size, such as a 48-inch x 48-inch x 12 feet what is required?

The exact size of the foundation will be given on the manufacturer's drawings. It will be of concrete somewhat wider than the bed and going well down into the earth, perhaps as much as six feet. It is well to have a lot of old railroad rail or other scrap metal, it will not hurt the foundation a bit to throw it into the concrete.

On this foundation there will be adjustable supports, set perhaps every four feet. These lie in pockets in the concrete, but are accessible, so that adjustments can be made without difficulty.

The bed of the planer is then set and so adjusted that both ways are absolutely level, and the ends a very little lower than the middle. This is because there is very much more weight at that point than at the ends and this set-up will bring the bed level when the housings and crossbar are attached.

The uprights must be perpendicular to the bed and parallel to each other. The crossbar must be at right angles to the uprights and parallel to the top of the platen. The sliding fits must be rigid, yet free enough so that there will be no binding.

On the accuracy of the planer depends the amount of fitting that must be done on every machine whose parts are planed on it. To a large extent its inherent quality depends on these adjustments of the planer. Any inaccuracy here must be corrected later by additional machining or by hand labor.

Even though erected in the very finest manner, the planer cannot be neglected and its alignment must be kept checked. Although rather unusual, it pays to have a standard system of testing. This pays two ways, in the increased life and lessened depreciation of the planer and a very material decrease in the cost of planing in the shop.

Some Possible Accidents

It is worth while considering some of the accidents which may occur to this machine.

There is first of all the foundation. Even the heaviest may settle somewhat. The alignment needs frequent checking, both for level and for perpendicularity of parts.

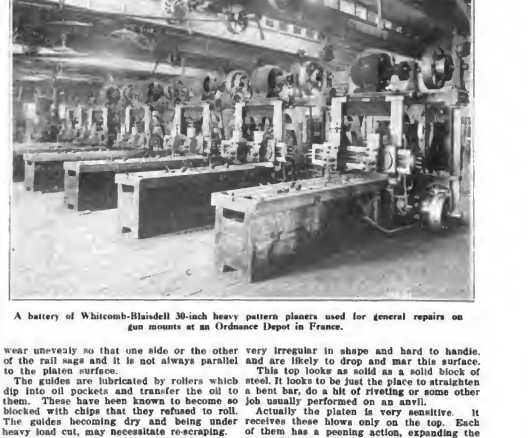
The elevating screws of the cross rail may wear unevenly so that one side or the other of the rail sags and it is not always parallel to the platen surface.

The guides are lubricated by rollers which dip into oil pockets and transfer the oil to them. These have been known to become so blocked with chips that they refused to roll. The guides becoming dry and being under heavy load cut, may necessitate re-scraping.

A chip may raise the platen, become imbedded in it and merrily score the Vee. Guides have been ruined by neglecting to pour oil into the pockets.

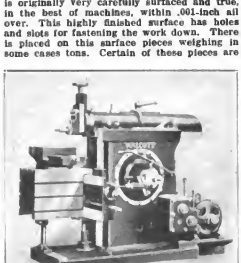
Because of the first cost, planer equipment is seldom bought in excess of heavy demands and when anything happens it is usually during such a peak. With modern high production machines it is mighty easy to get chips where they are dangerous and they should be kept well cleared away or they may cause jamming.

Pulley speeds are high and bearings must be watched carefully.



The platen deserves the best of care. It is originally very carefully surfaced and true, in the best of machines, within .001-inch all over. This highly finished surface has holes and slots for fastening the work down. There is placed on this surface pieces weighing in some cases tons. Certain of these pieces are very irregular in shape and hard to handle, and are likely to drop and mar this surface.

This top looks as solid as a solid block of steel. It looks to be just the place to straighten a bent bar, do a bit of riveting or some other job usually performed on an anvil.



Actually the platen is very sensitive. It receives these blows only on the top. Each of them has a peening action, expanding the top surface and tending to draw the platen up in the center. Driving in the stop pins assists this action and even in a pretty long platen it will in time cause it practically to support itself on the ends.

In correcting this condition it is necessary not merely to take a cut over the top of the platen but to refit the guides to make sure that there is full bearing.

Checking through to find the cause of the assembling trouble in two large shops this was found to be the condition of the planers in each. The cost of overhauling one of them was less than $300 and this amount was saved in the next two weeks in the payroll.

A battery of Whitcomb-Blaisdell 30-inch heavy pattern planers used for general repairs on gun mounts at an Ordnance Depot in France.

A 20-inch Walcott motor-driven shaper.

Getting the Most Out of a Planer

The planer is an expensive machine. In the first place it occupies a lot of space and every square foot in a factory costs money and must earn money. In the second place it takes a lot of power. The planer mechanic should be a very good man, for this is really an individual machine, where the operator and his ability make a lot of difference in the production.

At the best the planer has a very large percentage of non-cutting time. While running it never cuts more than two-thirds of the time. A large part of the time it is not running.

What can be done to bring up this percentage of cutting time? That means a very careful consideration of (A) cutting time, and (B) setting up time.

It is usually considered that a machine tool is to take off metal as its prime aim in life. Not so! They are there simply and solely to give the designed surface, exact to the drawing, having regard to both size and finish. Removing metal is merely a necessary evil.

If there is more metal than is required, it means another cut, with attendant loss of machining efficiency. If the metal is scant or incorrectly added so that the planer man has

Digitized by Google

to go into higher mathematics to get the piece called for on his print out of the casting, this too costs money.

It may be that increasing the size or the speed of the countershaft pulleys will help a lot. It may be that feeds are not as deep and wide as they might be, particularly in the roughing cut so that either another roughing cut or a very slow finishing cut is necessary.

Sometimes dogs get worn and for safety's sake they are set for too great an overrun.

The equipment that goes with the planer has a lot to do with the amount of metal which can be taken off at a time. If there are sufficient dogs, jacks and braces so that the piece can be made practically a part of the planer, cutting speeds and feeds can be made much greater. Parallels should be actually parallel and there should be enough of them.

Setting-up time reduction is equally important whether the planer is old or new. Except on highly jigged work it is seldom that a planer is actually running more than 50 per cent of the time. An old mechanic with brains may easily earn far more money than a new high power planer run in an ordinary manner.

The set-up time naturally divides into three parts: laying off the piece for machining, actually putting the piece on the planer, and fastening it in place.

Where there is a battery of planers, this problem is often solved by installing a large surface plate in the center of the shop and laying off all pieces on this surface plate before it is put on the platen.

On large planers, where there was room for both pieces, the writer has seen cutting being done on one while the other one was being laid off, the planer platen serving as a surface plate, the planer man riding on the planer.

In other cases the planer man is given a helper, sometimes an apprentice, who watches the piece being machined while he lays off and gets the next piece ready for machining.

Getting the next piece to the planer before the last has been finished is good practice. One thousandth of an inch in a precision lathe on a small piece is easy but .001-inch on a casting fifteen feet long, with a surface possibly only two inches thick except where the braces and with from ¼-inch to 1 inch variation in the amount to be removed is a far different matter.

To do this requires an intimate knowledge of metals and the way they act. In an intricate piece this is complicated by the necessity of careful measurement to find just where the metal must be taken off to give the piece the drawing calls for. The more thought put on the problem, the quicker the job and the more satisfactory the result. If this thought can be given while the purely mechanical work of watching the planing of another piece is going on, the total efficiency of the planer is increased.

In some shops there is lots of room for improvement in the arrangements for taking pieces off and putting them on the planer. Where the pieces are very large, the traveling crane is of course absolutely necessary. With the present universal use of electricity and the many forms, both cheap and good, of electric hoisting machinery, the operating efficiency of many a planer could be greatly increased at small cost.

Here an intelligent assistant is of great service, as is also the case in the next step, in the tying down of the piece to be machined. Even if he spends part of his time wheeling away chips, intelligence pays here. There is many a time when he can save the shop considerably, running the planer while the real mechanic is getting ready for the next piece.

Jigs and Fixtures

In the automotive industry jigs and fixtures have had very much attention. It is often not realized that where the quantities are small, just how economical jigs and fixtures are. Of course the smaller the quantity, the less elaborate they may be.

They cut the setting-up time materially, and, being designed to support the piece properly, there is possible the highest machining speed. The simplicity and low cost of really practical jigs are often not realized until a close study is made of the subject.

They have another advantage, in that with their use interchangeable manufacture is promoted. Unless you have some absolute standard to make your piece to, it is very difficult to plane several so that they can be used interchangeably. This means that there must be a lot of fitting, which is very unsatisfactory, for in this country the race of fitters is nearly extinct.

The following list of manufacturers is appended for the convenience of manufacturers who may be in the market for planers, shapers or slotters:

Standard Planers

American Tool Works, Cincinnati; Betts Machine Co., Rochester, N. Y.; Cincinnati Planer Co., Cincinnati; Cleveland Planer Co., 3145 Superior Ave., Cleveland; Cleveland Punch & Shear Works, Cleveland; G. A. Gray Co., Cincinnati; Hamilton Machine Tool Co., Hamilton, Ohio; Hilles & Jones Co., Wilmington, Del.; Liberty Machine Tool Co., Hamilton, Ohio; Morton Mfg. Co., Muskegon, Mich.; Niles-Bement-Pond Co., 111 Broadway, New York, N. Y.; Ohio Machine Tool Co., Kenton, Ohio; F. R. Patch Mfg. Co., Rutland, Vt.; Powell Machine Co., Worcester, Mass.; Rockford Machine Tool Co., Rockford, Ill.; Wm. Sellers & Co., Philadelphia; Simmons Machine Co., Albany, N. Y.; Whitcomb-Blaisdell Machine Tool Co., Worcester, Mass.; W. A. Whitney Machine Co., Rochester, N. Y.; Woodward & Powell Planer Co., Worcester, Mass.

Open Side Planers

Automatic Machine Co., Bridgeport, Conn.; Cleveland Machine Tool Co., Cleveland.

Crank Planers

Cincinnati Shaper Co., Cincinnati.

Open Side Planers and Shapers

Lynd-Farquhar Co., Boston.

Shapers

American Tool Works, Cincinnati; Cincinnati Shaper Co., Cincinnati; Columbia Machine Tool Co., Hanover, Pa.; Davis Machine Tool Co., Inc., Rochester, N. Y.; Gould & Eberhardt, Irvington, N. J.; Hendey Machine Co., Torrington, Conn.; Hollingsworth Machine Tool Co., Covington, Ky.; Jackson Shaper Co., Jackson, Mich.; R. A. Kelly Co., Keeha, Mich.; Milwaukee Shaper & Transmission Appliance Co., Milwaukee, Wis.; Modern Tool & Machine Works, Newark, N. J.; Morton Mfg. Co., Muskegon, Mich.; Niles-Bement-Pond Co., 111 Broadway, New York; Ohio Machine Tool Co., Kenton, Ohio; Osborn & Seaton Machine Co., Columbus, Ohio; Potter & Johnson Machine Co., Pawtucket, R. I.; Pratt & Whitney Co., 111 Broadway, New York; Queen City Machine Tool Works, Cincinnati; Rhodes Mfg. Co., Hartford, Conn.; Sellew Machine Tool Co., Pawtucket, R. I.; Smith & Mills Co., Cincinnati; Springfield Machine Tool Co., Springfield, Ohio; John Stepan Co., Cincinnati; Stockbridge Machine Co., Worcester, Mass.; Streine Tool & Mfg. Co., New Bremen, Ohio; Whips Machine Tool Co., Sidney, Ohio.

Traveling Head Shapers

Boynton & Plummer, Worcester Depot, Vt.; Cincinnati Shaper Co., Cincinnati; Morton Mfg. Co., Muskegon, Mich.

Vertical Shapers

Cochrane Bly Co., Rochester, N. Y.; Pratt & Whitney Co., 111 Broadway, New York; Rhodes Mfg. Co., Hartford, Conn.

Slotters

Baker Bros. Machine Co., Toledo; Betts Machine Co., Rochester, N. Y.; T. C. Dill Machine Co., Philadelphia; Niles-Bement-Pond Co., 111 Broadway, New York; Wm. Sellers & Co., Philadelphia.

HAWKINS WITH GMC

Former Ford Sales Head Will Act in Advisory Capacity on Merchandising

NORVAL A. HAWKINS

Norval A. Hawkins, the man who is credited with having had much to do with the remarkable sales success of the Ford Motor Company, of which for several years he was general sales manager, joined the General Motors Corporation oh April 1. Mr. Hawkins, whose offices will be in Detroit, will act in an advisory capacity as regards sales, advertising and service.

TO MAKE 3,000 HANDLES DAILY

Announcement is made by Joseph Stiglich, owner and manager of the new handle manufacturing concern in Laurium, that operations have begun and that it is expected an average of 3,000 handles a day will be turned out.

MUNICIPAL BONDED INDEBTEDNESS

The following comparative statement of bonded indebtedness of nine Michigan cities has been compiled by Harry Freeman, city menager, and Douglas Turnbull, city auditor of Kalamazoo.

City	Total Bonded Debt	Portion of total bonded debt that represents utility bonds
Flint	$5,715,850.00	$1,654,050.00
Saginaw	2,157,050.00	919,000.00
Pontiac	2,097,500.00	1,083,500.00
Lansing	2,721,000.00	1,095,000.00
Muskegon	1,798,250.00	385,000.00
Jackson	1,251,000.00	110,000.00
Bay City	1,547,061.00	505,362.00
Battle Creek	934,000.00	NONE
Kalamazoo	881,875.00	184,360.00

MASONS DOWN TO $1.12 AN HOUR

Detroit mason contractors and their employes have agreed on a wage scale of $1.12½ cents an hour, effective May 1. The old scale was $1.25 an hour. Some time ago the contractors announced a cut of 25 cents, effective March 3. This the men declined to accept, and the compromise is the result.

DOREMUS ON BANK BOARD

Frank E. Doremus, who retired this year as congressman from the First Michigan district, which embraces the east side of Detroit, has been elected a member of the board of directors of the American State Bank, Detroit.

BACHE ARGUES FOR SALES TAX

Jules S. Bache, of J. S. Bache & Company, New York bankers, addressed the Retail Merchants' Bureau of the Detroit Board of Commerce, last week, urging the enactment of a turnover tax. There will be no real prosperity, he said, until the present inequitable system of federal taxation is replaced by a sales tax. He asked his hearers to write their congressmen and senators in support of the turnover tax. Other speakers were Superintendent Johnson, of the state department of public instruction, and H. M. Nimmo, editor of Detroit Saturday Night.

Pity The Poor Meter Man

He Has His Woes, a Good Share of Which, Contrary To the Popular Belief, Are Other Than Electrical

By GEORGE OPP
Safety Engineer, Detroit Edison Company

WE HAVE ADVANCED so far in the study of industrial hazards and modern safety measures that the major dangers incident to the day's work are well catalogued and well safeguarded. Therefore we can now turn to what appear to some people to be little things—the apparently trivial, but nevertheless quite important contributions to the casualty lists.

In the consideration of the electrical phase of this subject, I shall consider:

First, the hazards that are potentially and actually causing the accidents in the varying degrees.

Second, the manner and method of avoiding

FIGURE 1

the occurrence, and surely by all means, the recurrence of all such accidents.

I shall attempt to get a close glimpse of the regular routine of, and to enumerate briefly the various accidents that may befall an electric meter reader, and then also take a glimpse into the lines of their closely associated workers—the meter testers, meter repairmen and meter inspectors, and, finally, to complete the subject, we shall take up the other departments of an electric utility that sometimes work on equipment off the company premises.

Within our own organization there are 31 meter readers, walking upwards of 500 miles in the aggregate daily, climbing up on elevations and hurrrying down-stairs to read on the average of from 800 to 1,000 meters a day. When we consider that each step taken is potential of casualty, whether on icy pavements or in dark and littered basements; whether up or down-stairs that are in all conditions of upkeep and lack of upkeep—sometimes so full of eatables that the ice man would growlingly refuse to go another step; when we think of these men (and due to war-imposed conditions, women as well, because we have had women meter readers in our service) having promptly to adjust their eyes from the glaring sunlight on the shiny pavements and sidewalks, or the glare of winter snows to the darkness of back stairways pierced by the feeble attempts of the "flasher" (i. e., pocket flashlight), and just as readily to meet the physical reaction of extremities of temperature in going in and out of buildings in rapid succession, especially in the winter season; when we stop to consider all of these various possibilities in passing, is it any wonder that there are some accidents occurring these days to the "knights of the tin books and lead pencils"?

We wonder, especially when we realize that the existence and removal of the hazards encountered are beyond the scope of the meter readers themselves, and in most cases beyond power of action by the company, that the number of accidents is not multiplied several times over. It is often a game of politeness to eradicate those points of hazard to the meter readers, and the thing has to be handled, I tell you, in mighty diplomatic fashion so as not to incur, especially at a time like this, when we are somewhat up against it on the proposition of furnishing all the service demanded, to win the co-operation necessary in repairing stairways or cleaning up debris in basements, providing clear passageways to meters, furnishing guards on offsets, removing hazards, etc.

Some of the Hazards

A list of the definite conditions that may be set down as most hazardous to life, health and limb, and most frequently met in the regular routine of the meter readers, would show such items as:

Steps missing in the stairways;
Loose treads on stairs;
Obstacles on stairs, such as foodstuffs, cans, mops, baskets of clothespins being dumped into or stepped into by the men coming in from the outdoor light and finding unable to discern the objects in time;
Poorly constructed platforms;
Unguarded pits and offsets;
Unsanitary and frequently slippery floors in basements left perhaps by some folks who very nicely scatter a lot of water over the high spots to wash all of the debris into the low spots and let it go at that, generally happening shortly before the meter man performs his visit;
Dark and unkempt storage in basements, including rubbish, broken glass, rusty nails, unsparing bits of wire and the like;
Oftimes the meters are located, against all requests to the contrary and contra-wise to all reason and logic, apparently, in such almost inaccessible places as over icebergs, in close contact with the ceiling over stoves and ovens that are invariably hot when the reader appears to give the dinin the "once over"; and sometimes in cubby holes that require the agility of a house cat, the slenderness of a Venus and the native training of a mouse to ferret into and extract oneself from.

It is funny how the attempt is made, in many cases, to "hide" the little pulsating box.

These unfavorable conditions of meter location, of course, lead in turn to climbing and straining that oftimes involve physical peril by reason of the lack of a suitable ladder or safe substitute; and certainly we cannot expect our meter readers always to carry their own ladders!

Surely these conditions compel the undesired, yet sometimes necessary, use of such expedients as boxes and tables and chairs or stoves to build up a mount to the zone of vision of the dials of the pulsating meter which the contractor or owner seems to think of such minor concern when he allots the space for its presence, and which sometimes—happily infrequently, however—he later considers so seriously when he orders the "miscreant racer" out of his premises by reason of the "ridiculously high bill this time."

We attempt to discourage that thoughtless practice of placing the meter "just anywhere," but we find that it is being done in some cases.

FIGURE 2

There is where we need, once in a while, to exercise a little bit of diplomacy in getting the change which ofttimes can be made, and generally is made, quite readily, when called to the attention of the proper persons.

Sometimes, of course, due to foresight on the part of architect, builder, owner, or due to the provisions of building code and ordinances, in some localities the meters are quite properly located, but the customer unthinkingly and quite unintentionally blocks the passageway to the meters by articles of storage, ranging from small boxes and pails in the basement or discarded hoopskirts in the attic at home, to automobiles in the garage, or huge store boxes that resemble elephants in repose, down at the business places. These conditions lead to possibilities of accidents.

Man's most faithful animal friend, the dog, presents for the apparent stranger-reader a considerable bit of worry, torment and even menace. Some dogs show so much faithfulness—

Digitized by Google

faithfulness to devitry—as they come rushing upon the unsuspecting meter man from an obscure hiding place and attack an unguarded flank. Yes, dog bites contribute quite a goodly share to our meter men's accidents.

Then, too, there is the moral hazard that is often encountered by men who have the occasion and the privilege of entering all manner of homes, hovels, stores and hostelries, but very fortunately, and proudly too, we can say that for some time our company has not received a complaint of even a pin having been stolen; nor has there been experienced any of the other salacious circumstances you may know are occasionally encountered. Sometimes, too, a meter reader has been the unfortunate passerby or bystander at an altercation, arriving at the scene of a domestic quarrel probably just in time to receive a shoe, a broom or a flatiron. We have had instances of that kind.

Meter Installers' Troubles

We may next consider the accident experiences of the members of the meter installation department, who logically precede the meter readers in the rotation of work, but who, as a class, slide considerably behind them in the results of hazards encountered.

In addition to nearly all of the aforementioned risks that fall to the lot of the readers, the installers have a few that are peculiar to themselves. Their work takes them into partially completed structures where overhead clearances are reduced by carpenters' scaffold and "horses," or where as yet mayhap no housewife's broom or carpet sweeper has cleaned up the debris of construction work. In this situation frequently are found nail-punctures, strained knees, scraped shins, bruised bodies and bumped heads. Of course we infer that we have such competent men engaged in this class of work—that such things as smashed fingers, pinched and battered thumbs and badly scratched hands are almost unknown and surely very infrequent happenings among our meter installers. Nearly all the conditions of hazard which they encounter are, in the instance of the meter readers, quite generally beyond their own or even the company's legal powers to correct physically. The meter readers have only one rule of safety—one try to simplify comprehensively these days when the "world is growing tired of codes and rules" —and that rule reads: "Use the utmost care in moving around on other people's property and report at once any unsafe condition in getting to a meter."

Closely associated with the meter-readers and installers are the meter testers. They may be grouped in two classes:

First, as shop and laboratory men who aside from the shop hazards of pinched and scratched fingers and hands—I pass by the electrical hazard because in the case of meter testers in our shops that sonnee of harm has been obviated by reason of the impact-meter test panels, carefully labelled, well insulated cables and contact clips—flush receptacles eliminating exposed contact surfaces and loose wires—has been reduced, I say, to such an extent that, to my knowledge, a meter tester has not met with an electrical injury for the last two years.

Second, as outside testers. These men perfodically test sub-stations, meters on 500 volt direct current railway service, and meters measuring service supplied to primary (4,600 volts) customers. Electrical hazards are ever present but are largely under the control of the testers. Special cables with convenient and positive connectors are furnished. Tools are carefully selected and inspected to insure all possibilities of harm due to mechanical defects. Some of the tools are given additional insulating qualities. Insulated stools, rubber gloves, goggles, etc., all play parts in reducing the possibility of accident to the very minimum.

In going off company premises the meter inspector sometimes meets such other peculiar risks as faulty grounds of meter cases, electrically-charged metal doors or doorknobs and keyholes of primary service houses or industrial shb-stations.

Meter men are instructed to report immediate] any unsafe condition. Their department's safety rule Number 1 emphasizes this by saying: "If the apparatus to be worked on

Statement of the Ownership, Management, Circulation, Etc., Required by the Act of Congress of August 24, 1912, of

Michigan Manufacturer and Financial Record

Published weekly at Detroit, Michigan, for April 1, 1921.
State of Michigan,
County of Wayne—ss.

Before me, a notary public in and for the state and county aforesaid, personally appeared Ira W. Welbon, who, having been duly sworn according to law, deposes and says that he is the manager of the Michigan Manufacturer and Financial Record and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations printed on the reverse of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor and business manager are:

Publisher—Manufacturer Publishing Company, 611 Free Press Building, Detroit, Mich.

Editor—Ira W. Russell, 611 Free Press Building, Detroit, Mich.

Managing Editor—Harold High, 611 Free Press Building, Detroit, Mich.

Business Manager—Ira W. Welbon, 611 Free Press Building, Detroit, Mich.

2. That the owner is: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding one per cent or more of the total amount of stock): Manufacturer Publishing Company.

John A. Russell, Ira W. Welbon, Edward R. Grace, Harold High, all of 611 Free Press Building, Detroit, Mich.; Mrs. Earl Woodburn, 200 Harmon Avenue, Detroit, Mich.; W. W. Mooney Estate, Arts Building, Detroit, Mich.; Alfred Fischer, 611 Free Press Building, Detroit, Mich.; F. Arnold, Geddes Road, R. 11, Ann Arbor, Detroit.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are (if there are none, so state): None.

4. That the two paragraphs next above, giving the names of the owners, stockholders and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is: (This information is required from daily publications only)

(Signed) IRA W. WELBON,
Business Manager.

Sworn to and subscribed before me this 23rd day of March, 1921.

(Seal) CHARLES COHN
My commission expires April 14, 1922.

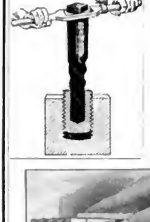
is in a dangerous condition, or if it is located in a dangerous place, do not work on it, but make a complete report to your foreman."

The testers are fully instructed in the right way of testing all installations and the fallacies and serious results of the wrong way are pointed out. Figure 1, for instance, shows the correct way of testing an outdoor direct current meter installation. Figure 2 shows how an extremely hazardous situation can be created from what is ordinarily a harmless installation. These two pictures tell a story that is found well worth repetition to meter testers and applies in part to meter readers and installers as well.

Other Dangerous Situations

I want to touch briefly, if I may, entries here to recite the circumstances of a condition which had strong accident possibilities—one apt to be encountered at any time.

Recently a call of our inspectors was sent to a primary meter installation, at the State Fair grounds, to replace a number plate on the meter connecting box. As the customer was through with this service, the high tension disconnect switches had been opened. While at work on the meter connection box, the inspector discovered evidence of current at the terminal board. Further investigation it was found that this installation was being energized due to a back feed from another meter installation on the ground. This created an extremely dangerous condition about the primary house, reversing the current through 250 K. V. A. transformers and stepping up the potential to 4,600 volts. This was a startling condition on some of the lines about the fair grounds, but was not known to any of the electricians who were about to take down some temporary wiring from these lines. The inspector immediately disconnected the circuit which created this condition and advised the construction foreman of his finding. The condition was quickly remedied. The man who called this condition to our attention was given a money reward as a token of appreciation. I might further state that in our practice every safety suggestion received is promptly acknowledged and acted upon, and where adopted, a check is given to the man who suggested same—a thing that may not prove worthless in a short while, but something that is of some intrinsic value to the man.



We recently had one of our boys take a blacksmith's course in correspondence. Sometimes when he touched a key to the lock of a transformer house at an industrial plant. It appears that the wiring in the lighting conduit was sometimes in the conduit to the door. The inspector was obliged to stand in a puddle of water while opening the door and when he touched the lock he received a rather severe shock from the voltage of 110 volts. I might be well at this point to say that 110 volt circuits demand respect.

Another source of danger in the industrial power end lies in the growing complexity of dual or multiple source of potential, use of dynamotor sets, gas engine set-ups and steam turbines, and the past, present and future potential power plants. All contribute to the possibility of back-feed from other connections to lines which may be presumed to be "dead" for tests and repairs. There is, of course, the complication of some of the industries, by reason of the contingency that they feel they cannot always depend upon the central power stations, as they do to a large part, and thus go into their own industrial power plants and generating equipment feeding to common buses, permitting chance over for power requirement. In forgetting property to handle their switches or on account of inadequacy of control, permitting potential, at unsuspected places and intervals, there is quite a serious hazard to our meter-readers and testers, opening up a prolific source of accidents if action were not taken along definite lines of switching control in charge of the company's system operator and of providing adequate locking and safeguarding of disconnect switches and buses.

In Other Groups

Then there is the utilization department, another group of employes who operate on "foreign soil" as far as encountering conditions which may be otherwise than we would like

"EZY-OUT" Screw Extractor

"The Tool to Use on Broken Screws"

When a screw breaks off—any sort of a screw—deep down in a hole, don't bother with files, punches, cold chisels and similar make-shift tools. Drill a hole in the broken screw, insert "EZY-OUT" slap on a tap wrench and twist—and "EZY-OUT" backs the crew out *on its own threads* as easily as if it never had been broken at all. No re-tapping required, because there is no danger to threads of original hole. "EZY-OUT" is furnished in three handy sets, each made to cover a certain field. "EZY-OUT" saves time and profanity. It's as easy as winding your watch. We have them in stock.

They cost you little.

THE CHAS. A. STRELINGER CO.

Machinery—Tools—Shop Supplies

149-165 E. Larned St. DETROIT Cadillac 7080

them to be "at home." I speak of the inspection and service division, which has to contend with such conditions as electric hazards in changing fuses; stair hazards; street hazards—driving automobiles, temptation to speed for "service first" when it is thought that "safety first" is not appreciated by the irate and momentarily anxiously waiting customer who may have tried to patch up his old lamp cord or lamp socket and after an intense flash finds himself in darkness that gives him thoughts only of Hades when he finally stumbles to the telephone to summon the "minute men light restorers."

"Our sales engineers are deserving of a comment and in their behalf I might say that they oftimes get into rather unpleasant places in the performance of their scouting duty for the advance of the company. I might refer here to such a predicament as standing under a leaking steam pipe in a run-down privately-owned plant that the owner is trying to show to the sales engineer with perfect equanimity and saying, "You see, I don't need your service as bad as you might surmise. Oh, excuse me, sir, you better step out this way. Oh, look out for that pump there; it isn't guarded. Look out for that hot pipe; it isn't insulated. Look out, there goes a part of the rim of that roll-darned flywheel!" Yes, these are cited from actual happenings which sales engineers of central stations have had to face in their quest of selling "service."

Of course we might refer also to the experiences of linemen, both overhead and underground, who handle equipment and lines outside of the company's premises, strictly speaking; of garage and truckmen who are handling equipment outside of the bounds of company's property, furnishing repairs and service to vehicles totaling more than 600 automobiles and trucks; and of inspection and test operations performed by the purchasing department and construction engineering bureau on equipment before acceptance and arrival on company premises, or of the many peculiar plights which our customers' accounts department and claims division of legal department get into regarding such bits of illegally-used equipment as jumpers and meter offsetting devices—all off company's premises.

It's a Personal Matter

You will note an almost complete sparsity of mention of electrical hazard in these various phases of work—not because it is not there, for just last week I read of the case of a man who was shocked to death in the simple operation of handling a defective extension cord on a wet basement floor—but because, I believe, our men are constantly warned to be on the alert and their familiarity with the "silent juice" has bred respect and not the oft-mentioned contempt that is cultivated with familiarity.

In the departments which I have here discussed from the phase of accident hazards, I believe we have struck the real keynote of the success of safety work anywhere—we make the proposition of safety a personal obligation of the man himself. We stand ready, yes eager, to co-operate with him in any way that he may designate. The special educational training of the meter men, especially, is considered to be of importance. The trifling and coaching bestowed upon the man before he is assigned to a place of responsibility inculcates in him the alertness and regard for accident prevention that grows to be a matter of personal pride.

We try to get our employes to see what the practice of safety means for them—not only for the company. We try to make safety a personal matter in their own individual cases, getting them to respond in the altruistic spirit of suggesting, and working for the elimination of the countless hazards that keep creeping into the company of the size, rapid growth and scattered nature of our own.

RESEARCH CONFERENCE APRIL 6

Prof. A. E. White, of the department of engineering research of the University of Michigan, addressed the Detroit chapter of the Society of Automotive Engineers, Friday evening, March 25, outlining in a general way the plans of the University to co-operate with the manufacturers of the state in research. Mention was made of an item of $1,500,000 included in the institution's budget to defray the expense. A committee of 17 manufacturers will meet at the University, April 6 and 7, to draft the research program.

AHMEEK'S 1920 DEFICIT

The Ahmeek Mining Company reports a deficit of $741,919 for the year 1920, as against a deficit of $709,535 in 1919.

BUILDERS' SHOW A RECORD SUCCESS

The Detroit Builders' Show closed Sunday evening with a reported total attendance of 80,000 during the week. Exhibitors were well satisfied with the results so far as attracting attention to their wares and prospective buyers. Financially the show is said to have been a complete success, which was not the case last year. Officials believe now that a larger exhibition should be planned for next year, for which the Larned street Armory will not be large enough. That there is a strong building desire in Detroit was evident from the large number of calls at the information bureau by persons seeking information regarding the best methods of financing the construction of a home. This bureau and the extensive nature of the exhibits made this year's show more informative and interesting than any previous effort of the building industry.

State Cartage Interests Organize

Lansing Meeting to Protest Tax Legislation Results in Formation of a Michigan Ass'n

MICHIGAN'S cartage industry is to be given a statewide organization. Preparations now under way will be completed when the commercial haulers meet in Grand Rapids, Wednesday, April 6.

At a meeting in Lansing March 23 to protest against some legislation, previously reported in these columns, the trucking men who met for that purpose discussed and unanimously favored a state association, composed exclusively of cartage operators. E. N. Radcliffe, Grand Rapids, was named temporary chairman and F. L. Hiser, secretary of the Detroit Transportation Association, temporary secretary, to send out the call for the Grand Rapids meeting and to prepare a constitution and by-laws.

It developed at the meeting that there were many avenues of activity for a strong state association. The commercial hauling industry in Michigan is new since the war and the conditions under which it has been continued are most unfavorable for successful development. The state body will be called upon to do much educational work among cartage men, in the direction of good operation, cost keeping, co-operation in highway transport with local officials, development of routes, terminals, legislative action and clearing technical information.

According to latest available records there are approximately 2,500 truck and team operators in the state. They work under a wide range of conditions. In the Upper Peninsula the highways are passable only about eight months in the year, owing to the long winters. This creates one set of problems. Then there will be development of routes in remote sections where rail and interurban transportation is not far along.

One of the most important activities of the proposed state association is to promote the handling of perishable goods by truck, a service still in its infancy. It will be necessary to co-operate with farm associations and county agents in order to meet local conditions. The idea would be to supply the transportation equipment which is inadequate every autumn.

Motor truck operators' meetings also pay much attention to truck sales methods and policies and it is likely that this will take a place in the program of the state body, with the idea of having truck sales at the highest possible level for the protection of buyer and seller.

Dump truck operation probably will be covered, in the light of informal discussion held at the Lansing meeting, and it is also probable that bus operators will be permitted membership.

The members of the state association will be invited to attend the annual convention of the National Team & Motor Truck Owners' Association, to be held in Detroit in June, with the Detroit Transportation Association as host.

The following individuals or representatives of companies registered at the Lansing meeting and supported the movement for a state body:

Detroit Transportation Association, representing 500 operators of motor trucks; L. J. Flanara, Marquette; G. D. Merrick, Fenton; F. W. Richmond, Lakeview; Ira Wilson, Detroit; Lee H. Bierce, Grand Rapids Association of Commerce; E. C. Dunbar, Detroit; W. G Moon and Charles Foster, Cadillac; John W. Frantz, Sonth Haven; Booth Bros. Transfer & Storage, Sault Ste. Marie; Hastings Truck Company, National Storage Company and Kalamazoo Storage & Transfer Company, Kalamazoo; Brown Garden Company, Lansing; City Dray Company, Independent Dray Company, Kalamazoo; Owosso Truck Company, Owosso; Alden & Aiden and Green & Company, Benton Harbor; M. Burkey, St. Joseph; S. A. Elsifor, O. E. Godfrey, D. J. Jeanette, William Fraser, C. B. Rhodes, W. B. Waterman, F. & L. Cartage, F. H. Horton, F. E. Dingman, F. G. Ash, Weinberg & Kratz and Michigan Furniture Company, Ann Arbor; Associated Truck Lines, Grand Rapids; Charles P. O'Hara, St. Joseph; Frank W. Peterson, Rockford; E. N. Radcliffe, A. D. Groot Storage Company and Osemund Iron, Grand Rapids; International Storage Company, Jackson; F. N. Rounsville, Lansing; G. Shierp, Republic Motor Truck Company, Alma; G. F. Downing, Lansing; F. C. Schneider, L. H. Tanner, Tanner Cartage Company, C. & H. Neilson, L. J. Gardner and Fred J. Baier, Detroit.

REPLACING AUTOMOTIVE GLASS

A new automotive convenience has begun operations in Detroit, known as the Auto-Glass & Manufacturing Company, at 48 Watson street, specializing in replacing broken glass in windshields, door or body. W. H. Flooding, formerly superintendent of the Van-Guard Manufacturing Company, is general manager. The very best of equipment has been installed and a large stock of glass is kept on hand.

FUNDS NEEDED FOR CHINESE RELIEF

The Michigan Manufacturers' Association, through its general manager, John L. Lovett, has addressed a communication to its membership asking them to co-operate in every way possible with the Michigan Committee for China Famine Fund, which is endeavoring to raise money to help alleviate the suffering of 15,000,000 people starving in China. Edwin Denby, Secretary of the Navy, is honorary chairman of the Michigan committee; Charles H. Campbell, Detroit, is chairman; Dr. M. L. Burton, president of the University of Michigan, and Prof Henry C. Adams, of the University, vice-chairmen, and Allen B. Crow, of the Detroit Y. M. C. A., secretary. Representatives of the committee have been appointed for each county in the state. The need is urgent and the committee therefore hopes that the manufacturers will respond. Woodrow Wilson in the closing days of his administration issued a proclamation urging support of the work of the national committee, of which Thomas W. Lamont, J. P. Morgan Company, is chairman, and President Harding, as one of his first official acts, concurred in Mr. Wilson's appeal. Gov. Groesbeck, of Michigan, likewise has made an appeal for funds. Communications should be addressed to Mr. Crow, at the Detroit Y. M. C. A.

AUTO BODY CAPITAL INCREASE

Stockholders of the Auto Body Company at a meeting last week adopted a resolution authorizing an increase in common stock of $600,000, to be sold at not less than par. This increase makes the total authorized capitalization of the company, $2,300,000 common, with $600,000 preferred. The company has retained $50,000 of the preferred in the treasury with a like amount of common to offset the preferred at conversion period. The company has $2,000,000 of business on the books, but this has not all been released. Large contracts are released for April, however, which assures employment of a large force.

REPLACING AUTOMOTIVE GLASS

A new automotive convenience has begun operations in Detroit, known as the Auto-Glass & Manufacturing Company, at 48 Watson street, specializing in replacing broken glass in windshields, door or body. W. H. Flooding, formerly superintendent of the Van-Guard Manufacturing Company, is general manager. The very best of equipment has been installed and a large stock of glass is kept on hand.

Grist of the Week In the Legislature

[By Staff Correspondent]

LANSING, March 28.—Of considerable importance to industry and labor of the state was the passage by the House last week of Governor Groesbeck's measure to create a department of labor and industry. This department will combine into one department the present state industrial accident board, labor department, commissioner of labor and the industrial relations commission. The commission would comprise three members to be appointed by the governor with a salary of $4,000 per annum.

The battle on the Osborn bill giving the public utilities commission full control of utilities opened at a public hearing of the railroad committee of the upper house. Those favoring the plan emphasized the necessity of removing utilities from politics and giving a body of state experts the power to fix rates. Municipal authorities opposed the loss of local control.

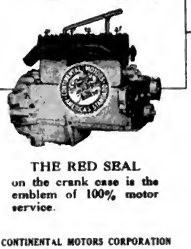
Permission for the state to issue $10 000,000 of bonds annually for highway construction instead of the present limit of $5,000,000, and to increase the interest from 5 to 5½ per cent is the substance of the Evans highway bill considered by the House.

Rep. George Lord's bill which recodifies the laws governing corporations in Michigan was passed by the House and sent to the Senate. Two changes remove the present $50,000,000 limit in capital stock and permit corporation to organize on a non-par basis.

The income tax amendment to the constitution was defeated in the House, failing by three votes, the final vote being 64 to 30 in favor, with six members absent, a two-thirds vote being necessary. By resolution the amendment was laid on the table so it may be taken up again later.

Among the other new bills introduced are: By Rep. Robert McDonald, Laurium, giving the utilities commission power over rates of carriers by water; Rep. Charles Evans, Lenawee, requiring railroads to maintain crossings at certain standards; Rep. Dacey, Detroit, to prevent persons who are refused applications for automobile drivers' licenses from obtaining a chauffeur's license from the state department, and to prohibit combination of drivers' and chauffeurs' licenses; by Senator George M. Condon, Detroit, authorizing counties, townships, cities, villages and school districts which can borrow money payable in one year to issue and sell negotiable bonds for the payments of their debts, no bonds to be for more than 20 years, nor bear higher than 6 per cent interest.

F. H. ELLSWORTH RESIGNS



Frank H. Ellsworth has announced his resignation as insurance commissioner of Michigan after four years in office. It will take effect April 30. Mr. Ellsworth resigns at the same time as president of the National Association of Insurance Commissioners of the United States. He will become vice-president and agency director of the Detroit Bonding & Mortgage Guarantee Company, Detroit, assuming his new duties at once. Mr. Ellsworth's term as insurance commissioner had still two years to run. He was appointed to the position twice by former Governor Sleeper. Mr. Ellsworth was instrumental in organizing the Berrien County State Bank, of which he was chosen the first president and which office he still maintains. He practiced law for years.

The Detroit Bonding & Mortgage Guarantee Company was incorporated under the laws of Michigan in June of last year and has an initial authorized capital of $1,000,000 and a contributed surplus of like amount. More than 40 per cent of the outstanding stock is owned by bankers. Archibald F. Bunting is president; Walter J. Hayes, president of the American State Bank, treasurer, and E. E. Englehart, president of the Englehart Audit Company, secretary.

MAXWELL-CHALMERS UNIT READY

Announcement is made by W. Ledyard Mitchell, president of Maxwell-Chalmers, that the corporation's pressed steel plant, which has been under construction for some months, is now ready for operation. The unit has 217,000 square feet of floor space and will take care of all pressed steel work for Maxwell and Chalmers. It is said to be one of the most modern and efficient in the industry.

ACCEPTANCE CORP. DIRECTORS

J. J. Schumann and Albert L. Deane have been elected directors of the General Motors Acceptance Corporation, succeeding W. C. Durant and H. F. du Pont, resigned. The General Motors Corporation meeting scheduled for March 31 was postponed to April 5.

DURANT PLANT FOR JACKSON

Each assembly plant in the chain of those affiliated with Durant Motors, Inc., will be separately controlled, but will be under contract with Durant Motors, it was announced in New York last week in connection with the purchase of the Long Island City plant of the Goodyear Tire & Rubber Company. The purchase price of the Goodyear plant was $2,000,000, it is said.

Report current in Jackson is that negotiations are in progress between Durant Motors and the Briscoe Motor Corporation for the acquisition of the latter's factory. The report has not been confirmed. Carroll Downes, vice-president of Durant Motors, is quoted as having made the statement that one of the Durant plants would be located in Jackson. Others probably will be at Flint, Saginaw and Lansing.

HIRSHFELD TO ADDRESS S. A. E.

C. F. Hirshfeld, chief of the research department of the Detroit Edison Company, will address the next meeting of the Detroit Engineering Society, April 14, in the auditorium of the Detroit Board of Commerce. His subject will be Industrial electrical heating. The society's twenty-seventh annual banquet will be held at the Hotel Cadillac, April 29.

PIERCE-ARROW RUMOR DENIED

There has been a rumor in certain financial quarters to the effect that new interests are to come into the Pierce-Arrow Motor Car Company, Buffalo, and that the company intends to discontinue the manufacture of trucks. Vice-President Geo. M. Graham, of the Pierce-Arrow company, in reply to a letter from this publication, writes us as follows:

"We beg to state that there is nothing whatever in the story that we will discontinue the manufacture of commercial vehicles, nor have we any knowledge of any new interests to be connected with our company."

AUBREY HEADS PACKARD ADVERTISING

James T. Aubrey, who has been western manager for the Cosmopolitan Magazine, became advertising manager of the Packard Motor Car Company, Detroit, on April 1, succeeding W. H. Holmes, who has returned to the agency field. Mr. Aubrey has had a long and successful experience in advertising business.

NEW AIR-COOLED MOTOR PROMISED

The Victor Page Motors Corporation has been organized under the laws of Delaware with capital of $5,000,000 to manufacture a new type of four-cylinder air-cooled motor which will propel a motor car to be known as the Victor Page Aero Type four. Maj. Victor W. Page is president and chief engineer. The car will be light in weight and of moderate price, says the announcement in New York. Headquarters are at 309 Lafayette street, New York. The factory will be at Farmingdale, L. I.

INTERNATIONAL MOTOR TRUCK

The statement of the International Motor Truck Corporation, New York, for the year ended December 31, 1920, shows total assets of $33,050,477, as compared with $25,561,458 in 1919; $15,346,235 in 1918, and $12,704,572 in 1917. Net profits for the year amounted to $2,644,013 after all charges and taxes, as compared with $1,983,469 in 1919. After deducting preferred dividends the net surplus was $1,128,781, or $143,369 in excess of the total at the end of 1919. The total surplus at the end of the year was $10,823,422, as compared with $3,525,070 in 1919; $2,539,659 in 1918 and $1,192,575 in 1917.

In the course of his statement to the stockholders President A. J. Brosseau says: "During the first nine months of the year orders were far in excess of the capacity of plants. During the last three months orders fell off and production was reduced to about 500 trucks a month. Orders on hand and prospects for business justify the statement that the sale of Mack trucks this year will not be less than the rate of production which obtained the last quarter of 1920. During the year $2,371,315 was added to the plant account. No further extension is contemplated at this time."

COURT ORDER AGAINST STRIKERS

The Fisher Body Corporation, Detroit, has been granted a court order requiring Local 127, United Aircraft, Automobile and Aircraft Workers, to show cause why its members should not be restrained p rmanently from interfering with workmen at the Fisher plants. The union has been on strike sometime and the Fisher corporation alleges that pickets are exerting pressure on workmen to make them quit their jobs.

DURANT STOCK OFFERED

Lansing investors were given their first opportunity to purchase stock in the Durant Motors, Inc., last week, when Carroll Downes, vice-president of the Durant corporation, was in the city and authorized G. N. Murchey & Company to sell the security. Mr. Downes emphasized the desire of the corporation to dispose of the stock in small lots, rather than to a few large investors. The stock was offered at the opening at 21¾. Glenn Murchey reports numerous sales to small investors, many paying for the stock on installments.

MOTOR VEHICLES IN CANADA

During 1920 the number of passenger cars and trucks registered in the Dominion of Canada increased 70,012 over the total for 1919. The number at the end of 1920 was 402,929, of which between 26,000 and 27,000 were trucks. The largest number of vehicles were in Ontario, there being 155,861 passenger cars and 16,204 trucks in that province; in Saskatchewan there were 60,325 passenger cars and trucks; in Quebec, 49,450 passenger cars and 3,000 trucks; in Alberta, 36,515 passenger cars and 1,000 trucks; in Manitoba, 34,817 passenger cars and 1,638 trucks; in British Columbia the combined total was 28,136; in Nova Scotia, 11,156 passenger cars and 1,300 trucks; in New Brunswick, 10,442 passenger cars and 658 trucks; in Prince Edward Island, 1,375 passenger cars and 10 trucks.

Ford Carries the Battle To Germans on Own Soil

Foreign newspapers, and especially the European trade publications, have given considerable space for some months to the efforts of Henry Ford, to introduce his tractor into Germany, and the opposition he has encountered at the hands of German manufacturers. In some of the Teuton papers it is said that the intention of the Detroiter is to put up a huge plant at an early date, after the Fordson tractor has been well introduced by a number of samples, which are to be used for demonstration purposes in the agricultural districts. The price at which the tractor will be sold eventually is said to be so low as compared with German-made tractors, as well as other imported similar equipment, as to cause not a little anxiety among the German manufacturers.

The most recent information on the subject is contained in a copywrited cable from Berlin to the Philadelphia Public Ledger. It follows, in part:

"Henry Ford has emerged victorious from his first encounter with the union of German motor plow manufacturers, whose objections largely were responsible for the government's refusing to grant permits for the importation of eight sample Fordson tractors that had been in a warehouse in Hamburg for three months.

"The economic committee of the Reichstag, after making a detailed investigation, overruled the objections of the German manufacturers and recommended that the federal government grant permission to import four tractors for demonstration purposes.

"They reported that the two contradictory protests, first, that the Fordsons, judging from reports from other countries, would prove of little use in Germany, and second, their importation or manufacture here would cause German firms too much competition, were insufficient for further preventing the bringing of the machines into the country.

"The committee further says German tractors generally are considered the best in the world, but might be improved by the study of one of America's latest productions. Another reason, and this is the chief one given for the action, was that this may make possible more intensive agriculture, which is much needed.

"Ford's plans, announced in dispatches last fall, to erect a factory in Germany and assemble parts manufactured by the Berlin firm of Ehrich & Gratz, according to original specifications, is beginning to take definite form. The action of the Reichstag committee is interpreted as indicative that the government no longer will prevent Ford from carrying out his project and that pressure applied by farmers' associations, whose members have placed hundreds of orders for German-made Fordsons, has at last been effective.

"One of the Detroit managers is expected in Berlin in April, and Henry Ford in May, according to one of the Berlin partners. Lars Jacobson, from the Detroit factory, now is exhibiting a borrowed machine, the only one in Germany, at the Leipsig fair."

MORTON SALT PLANT RESUMING

Resumption of work at the plant of the Morton Salt Company at Ludington was announced a few days ago. The company suspended operations some time ago, having its warehouse filled with salt, but no call for it. Now, however, the steamer Marion is being filled and will carry a load to Chicago. The normal working force includes about 100 men.

LAST OF MINE PLANTERS FINISHED

The last two of the eight junior mine planters made by the Defoe Boat Company, Port Huron, were completed and inspected a few days ago, and the entire fleet is now in the waters at Bay City.

HARDENING

We are equipped to take care of the treating of steel and make a specialty of automotive parts. We also can carbonize or temper tool, jig and fixture parts. Our truck enables us to give you 24-hour service.

GRINDING

Special screw machine equipment enables us to specialize in the manufacture of the following parts, all of which can be ground by the centerless method. We can grind to any accuracy required.

Piston Pins — Valve Roller Pins — Roller Clutch Pins — Dowell Pins (Hardened Straight) — Oil Pump Plungers — Roller Bearing Rolls (Straight) — Differential Gear Pins — Headless Shackle Bolts — Universal Joint Pins — Small Gear Shafts

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Washington—Announcement is made by Gen. Lansing H. Beach, chief of government engineers, that the Government has appropriated $518,000 for improvements to the Detroit river this season. The greater part of the money, it is stated, will be expended for better lighting facilities to guide ships up and down the river. No other Great Lakes bodies are mentioned in the major's announcement.

Adrian—Surveys for projected short-cuts on the D. T. & I. right-of-way in this county have been made as part of the plans of Henry Ford, owner of the road, to improve service on the line. Mr. Ford, who recently was elected president of the company, made a tour of the line last week, part of the way in the new Ford internal combustion engine driven car and the rest of the way on a steam locomotive, the gasoline car having encountered an accident.

Grand Rapids—In the complaint of the National Spring & Wire Company et al. vs. the director general of railroads, as agent, the Grand Rapids & Indiana Railway Company et al., the Interstate Commerce Commission has decided that the refusal of the defendants to absorb, on Interstate carload traffic to or from complainants' plants located on the tracks of the Michigan Railroad at Grand Rapids, the switching charges of that road, while contemporaneously absorbing one another's switching charges on like traffic to or from industries located on their tracks at that point under substantially similar circumstances and conditions, is unjustly discriminatory. The unjust discrimination was ordered removed and reparation denied. The case, which was No. 11029 on the Commission's docket, was submitted October 14, 1920, and decided March 5, 1921. The decision has just been made public.

Romeo—A motor bus line is now being operated between St. Clair and Romeo. For the present only one vehicle, seating 22 persons, is being used. Two trips are made daily. If business warrants, another bus will be added.

Grand Rapids—Motor bus lines have been started out of Grand Rapids on five routes, as follows: to Lakeview via Rockford and Greenville; to Lowell via Ada; to Belding; to Fremont via Sparta, Kent City, Casnovia, Bailey, Grant and Newaygo, and to Hastings by way of Cascade, McCords, Alto and Freeport. Five buses are used. Other routes are being mapped.

Port Huron—A new organization in Port Huron is the Local Freight Agents Association, which has succeeded the Traffic Club. The object is about the same, namely to bring together freight agents, chief clerks, accountants, cashiers and others connected with the railroad and steamship companies. The officers are: President, H. B. Wilson; vice-president, W. W. Shingle; secretary-treasurer, C. A. Wisdom. The first membership check showed 55 names.

Escanaba—The Soo Line has filed a petition for permission to buy the Wisconsin & Northern Railroad with the Interstate Commerce Commission. Ownership of this road by the Soo line would shorten its line between Chicago and Michigan points more than 100 miles.

Detroit—Amendments modifying the terms of the Seaway Act in favor of Great Lakes shipowners will be discussed in conferences April 8 and 9 at the Detroit Board of Commerce. Vessel owners, shippers and union representatives will attend.

A RECORD INHERITANCE TAX

Charles L. Freer, Detroit, who died September 25, 1919, leaving an estate valued at $3,523,278.74, bequeathed to the Smithsonian institution, a government unit, a good part of his famous Whistler collection, including the noted Peacock Room. The bequest represented a value of $2,859,850.25, on which the state of Michigan will collect from the Government an inheritance tax of $400,000, the largest tax of this character ever paid to the state. The Detroit Trust Company, Col. Frank J. Hecker and Dr. Charles D. Wolcott, executors, have paid the Wayne county treasurer $200,000 towards the inheritance tax. While the Government exempts from taxation gifts to religious, charitable and educational institutions, Michigan does not unless such institutions are under the state laws. Consequently the Government must pay this tax to the state of Michigan for the privilege of having the Freer gift.

MONROE COMPANIES IN MERGER

The Monroe Binder Board Company and the Boehme & Rauch Company, manufacturers of paper and paper board containers, Monroe, are agreed upon a merger to become effective May 4. The new company will issue $5,000,000 in common and $2,500,000 in preferred stock. L. W. Leather is president of the binder board concern, and E. C. Rauch is president of the other company.

WATERWAYS BODY IN LAST SESSION

Obadiah Gardner, reappointed chairman of the American section of the International Joint High Commission on the Great Lakes-St. Lawrence route to the sea, reappointed by President Harding, presided at the last hearing before the whole commission to be held in the United States, which opened in Detroit Board of Commerce, Wednesday morning. Following this hearing the commission will proceed to prepare its report on the project.

A CORRECTION

In the March 5 issue of this paper it was stated that Ward H. Marsh had resigned as advertising manager of the Burroughs Adding Machine Company to become sales and advertising manager of the Lincoln Motor Company, Detroit. This was in error. Mr. Marsh having joined the Lincoln sales and advertising department in an advisory capacity only. The management and personnel of the department remain the same.

FISHER FOR RESERVE BOARD

Edmund D. Fisher, formerly vice-president of the Bank of Detroit, has been mentioned as a prospective member of the Federal Reserve Board. Mr. Fisher has had a long line of banking experience, both practical and theoretical. He gave valuable testimony before the National Monetary Commission in 1913, when the present Federal Reserve Act was being framed, and possesses an unusually intimate knowledge of that law.

M. B. A. CONVENTION JUNE 6-7-8

The thirty-fifth annual convention of the Michigan Bankers' Association will be held June 6, 7 and 8, Monday, Tuesday and Wednesday, at Hotel Statler, Detroit.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Detroit—Announcement has been made from the offices of the Wayne County Medical Society that in the near future an office building, probably eight stories high, will be erected in the neighborhood of Grace and Harper hospitals for the exclusive use of physicians and dentists. Mounting values of downtown real estate was given as the reason for the location of the new building somewhat off the beaten path.

Lansing—This city is planning to draft a uniform building code and has obtained copies of the South Bend, Ind., code upon which to model the local regulations. Several amendments to the present code were made by the council last week.

Detroit—The building owned by the Independent Brewing Company, at Springwells avenue and the M. C. R. R., has been completely remodeled by its new owner, the Detroit Packing Company, which this week started the construction of two other plant units on the site. The packing company, recently organized, has capital of $3,000,000 and is headed by Edward F. Dold, who is president and general manager.

Cheboygan—The Cheboygan Tile & Brick Company expects to erect a plant. Dr. A. M. Gerow is president of the company and Herman Sheitley, secretary.

Detroit—Directors of the Michigan Mutual Life Insurance Company, meeting in Detroit late last week, recommended to the executive committee that it purchase the property at the northwest corner of John R. street and Madison avenue as the site for a new office building for the company. On the site is a three story building occupied by the training school of the Cadillac exchange of the Michigan State Telephone Company. The property belongs to the Detroit-Biltmore Hotel Company, of which the Union Trust Company is trustee. The consideration is said to aggregate $575,000. The Michigan Mutual is located at Jefferson avenue and Griswold street.

Lansing—Because of the lower prices at present, City Engineer Otto Eckert has advised the city council to arrange for building several bridges in the city this year. Bids have been received for the construction of a bridge at Elm street, but no decision has been reached.

Big Rapids—If the farmers of the neighborhood of Big Rapids pledge sufficient acreage, a canning factory involving an expenditure of $125,000 may be put up, according to the information given out a few days ago by E. S. Frey, representing the Michigan Canned Food Company.

Lansing—The Briggs Company has begun the erection of a warehouse here on land leased from the New York Central Railroad. The building will provide for the expansion of the company's wholesale building material business. The company will store in the new structure, steel bars, steel for reinforcements, sewer pipe and other stock.

Detroit—Bids on the pile construction for a loading dock at the foot of Orleans street in this city have been asked by the park commission. A dock large enough to accommodate two 125-foot barges is required.

It Was a Real Business Getter

(*Continued from Page 5*)

ployed when the factory was at peak production are at work. The demand, says Mr. Pulcher, is about evenly distributed among the five truck and two tractor models the company manufactures. There are no vehicles on hand and all that are being turned out are being loaded promptly. If orders continue to grow as they have during the last 30 days, it will not be long before the Federal is back to normal.

Roy D. Chapin, president of the Hudson Motor Car Company, which makes the Hudson and Essex cars, says the company is experiencing a "genuine spring opening of trade" and that production is being expanded daily. "The Hudson plant," says the statement, "is now working on a full time basis and every effort is being made to speed up shipments to match the great increase in orders now being received."

At the Stud baker, Paige, Columbia, Packard, Cadillac, Maxwell-Chalmers and Hupp factories production is said to be increasing.

SITE FOR NEW UNIT PURCHASED

The Mendel & Duel property, adjacent to the plant of the Baker Company, Allegan, has been purchased by the latter, in preparation for plant expansions.

O'CONNOR JOINS U. S. C. OF C.

J. J. O'Connor, formerly in charge of publicity of the First & Old Detroit National Bank, left this week for Washington, where he becomes manager of the finance department of the United States Chamber of Commerce.

Mr. O'Connor performed important services for the American Red Cross during the war, having superintended the administration of $2,000,000. He was educated at the University of Chicago and received a law degree from Kent College. The new finance department, according to the announcement, will give immediate attention to taxes and a national budget system.

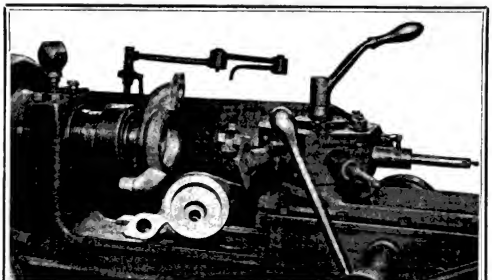
WHEEL TRUEING OFFICE MOVED

The Wheel Trueing Tool Company, importer of industrial diamonds and manufacturer of diamond-pointed tools, with general offices in Detroit, announces the removal of its western office from the Wells building, Milwaukee, to its branch office in the Great Northern building, 20 Jackson Boulevard West, Chicago. Wm. J Sansom will be in charge at the new location. The change was effected April 1. Mr. Sansom has been representing the western office for the last three years. Because of his former experience as night superintendent of the Milwaukee works of the International Harvester Corporation, and prior to that as instructor of mechanical practice, University of Wisconsin, he is well equipped to give the kind of service in grinding wheel trueing practice which is characteristic of the Wheel Trueing Tool Company.

MORE SPACE FOR LUPTON CO.

Announcement has been made by Malcolm J McLeod, Michigan manager for the David Lupton's Sons Company, Philadelphia, that the Michigan business of the company has developed to such a degree as to warrant immediate expansion of warehouse facilities in Detroit. The company will lease 40,000 square feet of floor space as soon as practicable, pending the building of a permanent warehouse, which will be 200 by 200 feet in plan and one story high. This announcement follows closely upon the completion of the new Lupton warehouse in Cleveland, which is of the same size. A third warehouse will be built in Chicago this year or early in 1922. This will enable the Lupton company to serve the entire Middle West directly and at the same time give it distributing points for the Far West.



The Lupton company manufactures practically every type of steel window and factory sash now made. In recent years it has developed a complete line of steel shelving and factory equipment which is in wide use in Michigan. The largest steel sash contract in the world, that of the Ford foundry and power house at River Rouge, is just being completed by the Lupton company.

FORMER BREWERY TAKEN OVER

The former Eckhardt & Becker brewery, at Orleans and Winder streets, Detroit, vacant since prohibition put a stop to its activities, has been leased by the King Coffee Products Corporation, Detroit, as a coffee refinery. The corporation is a new one organized by Detroit men to manufacture a new beverage known as coffee pep, and other coffee products. John E. King, president of the corporation, has spent a number of years in experiment in conjunction with the Mellon Institute of Industrial Research at the University of Pittsburgh. After exhaustive tests he is said to have arrived at a method of producing coffee products which is a departure from anything previously developed. Machinery is now being installed and alterations to the building completed, and it is expected that operations will be under way by July 1. Jess H. Wilson, formerly sales manager of the Pompeian Company, has been retained as sales manager of the King Coffee Products Corporation.

NEW HANDLE COMPANY

A handle manufacturing concern is being organized in Manistique by E. C. Coerper, Judson Hollenbeck and Ernest Knuth, the corporation to be known as the Manistique Manufacturing Company. Operations will begin next month. Besides making canthook and peavy handles, the company will bring out other wood novelties. The members of the company are all well known in the county and have had considerable experience in the business in which they have now embarked.

The hub of this Cast Iron Water-Circulatng Pump-Body has been turned and drilled on another No. 4 Turret Lathe. The tools on this No. 4 rough bore and true up for shaft, ream to size, counter-bore for clearance and finish bore and face large diameter—all in 5½ minutes. Most of these tools are standard.

Proper Tools for Turret Lathes

To do work well
a turret lathe must be equipped
with the proper tools.

Tools make or mar
a good turret lathe.
Re-tooling a turret lathe
often doubles its production.

In our catalog
we illustrate turret lathe tools
for all kinds of work,
bar or chucking,
and if you desire,
we help you select
the right tools for your work.

DETROIT, SATURDAY, APRIL 2, 1921

Relief for the Railroads

IN SPITE OF THE FACT that the tonnage being carried by American railroads today is four times what it was in 1886 and that the rates have been increased seven times, the carriers never were nearer bankruptcy than now. Relief must be afforded at once, no matter how radical the method, if industry in this country is not to be paralyzed by a general breakdown of the transportation system. One of the very first things, if not the first thing, to be taken up by the new Congress when it meets in April should be ways and means of enabling the roads to meet expenses. Otherwise there will be chaos. This is more important than taxes and the tariff.

When President Harding; Secretary Hoover; Chairman Clark, of the Interstate Commerce Commission, and R. M. Barton, chairman of the Railroad Labor Board, went into session early this week to consider the railroad problem, they were in possession of a mass of figures which showed in a startling way the plight in which the roads find themselves. The figures showed, to begin with, that the carriers were operating at a loss of $700,000 000 a year. They showed, in the second place, that rates and fares had reached a level so high that not only had they taken domestic business by the throat but were making it impossible for American manufacturers to compete abroad because of the expense of getting their goods to seaboard. Consideration of higher tariffs in such a situation is out of the question.

The President and his advisers had before them two recent reports, one dealing with railroad revenues for the month of January, 1921; the other with income and wage payments for the third quarter of 1920, both prepared by the Interstate Commerce Commission. The January report, which covered the operations of 202 railroads, showed a combined deficit of $1,167,800, and that 109 of the 202 roads had failed to earn their expenses and taxes during the month. The operating revenues had increased 5 1-5 per cent as compared with January, 1920, but expenses had grown 6 3-5 per cent. The net operating income had fallen off 120.6 per cent. As partly indicating the results of the present inordinately high rates and fares, the report showed that the bulk of freight carried had decreased 14.7 per cent in net ton miles and that passenger miles had fallen off 6 1-2 per cent. This report is serious enough, considered alone, but it is much more serious in that it is only a repetition of what other months have been showing. The net operating income of the carriers for the five months beginning with September 1, 1920, when the federal guaranty period ended, totals $225,167,000, which is at an annual rate of return of 2.81 per cent on their tentative valuation.

The other report was significant in that it embodied an analysis of the railroad operating costs which suggested the quickest way out of the difficulty. It revealed that of the total operating revenues for July, August and September, 1920, payrolls alone consumed 62 per cent. In 1917 the payroll was only 43 per cent of the earnings. The total payroll for this quarter, during which the increased rates of pay—from 25 to 40 per cent—were in effect, was $1,052,109,451 for an average of 2,157,989 employes, as compared with $801,063,938 for the second quarter of 1920 for 2,004,760 employes and $795,616,330 for the first quarter for 1,993,324 employes. The wage award was made retroactive to May 1, but the Commission's statistics did not include the back pay for May and June. This latter figure would amount to about $150,000,000. The increase in payroll for the third quarter over the second quarter was $251,000,000, or 31 per cent. Dividing the total compensation by the number of employes gives an average of $162 a month for the third quarter, as compared with $133 for the second quarter, an increase of 22 per cent. For the year 1917 the total payroll for 1,732,876 employes was $1,739,482,142, an average of $83 per man.

It was reported that the President and Mr. Hoover were prepared to impress upon Judge Barton that it was the opinion of the administration that the national agreements between the roads and the shop crafts should be sufficiently modified to cut $500,000,000 a year off the payrolls. To do that it would be necessary to scale wages down to where they were previous to last May, when the increase referred to in the quarterly report cited above went into effect. Mr. Hoover, it was said, had made a close study of possible economies all along the line and had come to the conclusion that nowhere could such a saving be effected as by reducing wages. This latter having been done, relief in the way of combinations of lines so that the stronger could take care of the weaker, would be considered. He was of the opinion that 62 per cent was too great a portion of earnings to go into wages.

Naturally, should such a course be decided upon, we may expect opposition on the part of the employes, who charge that they are being made the "goat," whereas alleged abuses on the part of the railroads, such as the payment of excessive salaries to high officials, the expenditure of far too much money for repair work to concerns allied financially with the roads, awkward and circuitous competitive routings and other mistakes in management are allowed to go unpunished.

Be that as it may, the carriers are up against a condition which demands prompt and effective action, and the quickest way must be followed. It would seem, therefore, that in view of the fact that there has been a decrease in living costs averaging between 15 and 20 per cent, as shown by the Department of Labor, the Railroad Labor Board could well order the wage reduction. This, as has been estimated, would save the roads half a billion dollars a year, leaving a deficit of $200,000,000 which could be cared for by further operating economies to be directed after the Congressional investigation which appears certain in view of Senator Cummins' desire to amend the Esch-Cummins law.

Fifty-Fifty

MAYOR COUZENS has resigned from the Detroit Board of Commerce because, he says, it does not agree with his policies.

Well, there probably are a lot of good people who would like to resign their Detroit citizenship as a mark of their disapproval of these self-same policies. But these folks do not enjoy the freedom of action that is the mayor's, and possibly, too, they feel it might not be a bad idea to stick to the ship.

Mr. Hays Makes a Start

WILL H. HAYS attacks the problem of the rehabilitation of the Post Office Department in a way so original that it must surprise, not to say startle, official Washington, accustomed as it is to red tape. In the first place he calls in a commission of business and professional men to tell him what is the matter with the postal service and what they would do about it if it were their own enterprise—which it is—and then he jumps

Digitized by Google

on the President and cabinet, demanding that they post their mail two or three times a day, instead of dumping it all in the hopper at 5 p. m. and adding to the confusion.

Now the amount of mail that must be handled by the Washington post office daily from the government buildings isn't going to clutter up the service all over the United States, even if it isn't handled till night. If Mr. Harding and Mr. Hughes and the others follow Mr. Hays' suggestion and carry their letters to the mail box two or three at a time, twenty or thirty or two hundred or three hundred times a day, it won't solve our postal problems here in Michigan, or California's problems, or Idaho's. What Mr. Hays has done is to call to the attention of the country, in a way so whimsical as not to be forgoten, the fact that it should help the Department solve one of its 4,114 problems by mailing three or four times a day and thus assisting local post offices to keep the grist moving. We have an idea that the average business man, remembering that Mr. Harding is taking care of his mail promptly, is going to put up a sign in his mailing room that letters and packages are to be sent to the post office a little at a time.

Mr. Burleson, with all his faults, recognized prompt mailing as one of the ways out of the Department's difficulties, but he hadn't the knack of "getting it over the footlights." Mr. Hays has that knack. If he will keep it at work, he will get us all thinking about how we can "help lighten the postman's pack." When we do, the results will be surprising.

The State Department Goes United States

MEMORIES of those stirring days when American diplomacy "spoke softly, but carried a big stick" are recalled by the documents Mr. Hughes has been drafting since he became Secretary of State. His communications to some of our recalcitrant international brothers remind one of that classic demand made when the Moroccan bandit kidnaped the American woman missionary and held her for ramson, "Miss Stone alive or Rasuli dead," and of President Roosevelt's notice to the Kaiser to get out of Venezuelan waters in thirty-six hours or be chased by George Dewey.

One of the first situations the new Secretary of State was called upon to meet when he assumed his portfolio was a two by four, but nonetheless earnest and dangerous scrap between Costa Rica and Panama—earnest because both sides had been heating their Latin blood over a slow fire until it had reached the boiling point, and dangerous because it promised to embroil the whole of Central America. What did Mr. Hughes do? He sent to both governments an identical demand, characterized not by its particular elegance of diction, but by the "wallop" it carried, that they call off their forces immediately, on pain of feeling the American foot on their necks. Did they obey? They did, and immediately.

Next the Secretary took his pen in hand and indited a little message to the Russian soviet government in which he made it so clear that even Lenine could understand, that the soviet outfit could not expect the United States government to have any official dealings with it until it gave convincing evidence of a respect for persons and private property. Mr. Hughes said it politely, but in a way that gave the world to understand that this was all he had to say.

Then he informs Lenine, Trotsky, et al., that the United States government is expecting them without parley to release some 500 Americans incarcerated in soviet prisons, many without the formality of trial. The message displayed a full set of teeth. The soviet government comes back with the reply that it will liberate our citizens as soon as we turn loose the Russian reds whom we had to lock up for our own safety during the period of the war. We have an idea, however, that after they have had opportunity to examine Mr. Hughes' answer to that, they will not wait for us to open our prison gates to their hired assassins.

Mr. Hughes is running the State Department just as all good Americans want it run. The Department "went United States" when he was appointed.

A year ago there were 800 families in Detroit on the books of the poor commission. Today there are more than 9,000. Yet the Detroit city government wants to make it harder for the poor to pay rent by spending money recklessly in buying street railways.

Short Measure Stuff

WE ARE GOING TO SCOOP the news department this week, just to make it jealous. The other day, while in Lansing, we learned that one of the representatives was planning to introduce a bill permitting search of laundries operated in the state and the seizure of towels and linens that have been taken from hotels and restaurants by patrons and guests and kept as souvenirs. We are pledged to secrecy as to the author of the measure until it comes out. He assures us that if, on advice of counsel, it is held unconstitutional, he'll amend the old constitution.

WATCH FOR THIS ONE
TRY THIS SPRING POEM ON YOUR VACUUM CLEANER

(From the Liner Column of a Contemp.)

"Goodbye Winter"

Early last fall you spread your pall,
Of gloom and want and woe,
You seared our sight with depression's fright,
And now we're glad to see YOU GO.

But the call of spring is a glorious thing,
To the salesman in the realty line,
And he forgets what's past,
And his heart beats fast,
For the good old summertime.

He knows the game will be good this year,
And he's aching to get a start,
But how to tell just what will sell,
Is the question that's in his heart.

Don't let this worry you any more,
Just come up and knock on our door.
Selling is easy under our plan,
The buyer pays just as he can.

See our Love Nests cosy and bright,
Handy for workers and a home of delight.
Through the summer and into the fall,
Our Love Nests will sell to one and to all.

Ask about our salesmen's school,
Maybe you don't know all the rules,
Of salesmanship and how to sell,
And of HUMAN NATURE how to tell.

If you've been knocked about,
And your heart's still stout,
If your shoes are thin,
But you're not all in,
And you still can grin,
Then, come in and talk it over.

The above was published under Help Wanted, Male. We'll say so.

HOW PARLIAMENTARIANS SAY "KEEP QUIET"

(From the Congressional Record)

Mr. King—Mr. Speaker, I ask unanimous consent to extend my remarks in the Record on the subject of rescue work on the Mississippi River.

Mr. Rayburn—Are these the gentleman's own remarks?

Mr. King—Yes, sir.

Mr. Rayburn—I shall have to object.

Mr. King—What is the purpose of the gentleman's objection?

Mr. Rayburn—Because everybody else's remarks are objected to.

Mr. King—I wish the gentleman would let me in on that.

The Speaker—The gentleman from Texas objects.

FINANCIAL NEWS AND COMMENT

CITIZENS TELEPHONE COMPANY

The annual report of the Citizens Telephone Company, Grand Rapids, came to hand this week. It covers the year ended December 31, 1920, and was presented to the stockholders at the annual meeting, March 22. Excerpts from the statements of General Manager C. E. Tarte follow:

"It had been thought from time to time that the territory served by the company had about reached the point of saturation and that there would be practically no increase in the number of telephones for some years to come, and yet the year just ended shows the largest net gain in the company's system since 1906, the net gain for 1920 being 2,916, of which 1,271 were in Grand Rapids. There is now in the entire system 41,486 telephones and we switch for 3,883 roadways."

"Conditions in Grand Rapids are quite badly congested on account of the great difficulty in getting material and equipment of all kinds, and the result has been that there occurred an unprecedented delay in filling new orders. There would have been several hundred more installations if they could have been taken care of more promptly."

"Considerable progress has been made toward converting the Grand Rapids Exchange to automatic ringing."

"The increased rates were of assistance, but were not sufficient to pay expenses and earn a fair return on the investment. For some years dividends of 8 per cent were paid on the company's stock. In 1911 it was found necessary to reduce the dividend rate to 6 per cent, and in 1916 it was again found necessary to make a further reduction to 4 per cent."

Secretary A. B. Wheeler explains the $227.17 compensation covering the period of government control was received in July, 1920, and credited to surplus account, inasmuch as the payment represents previous years' earnings. Notwithstanding the additional funds which this payment gave the company, Mr. Wells points out that bills payable show an increase of $80,985.34, due principally to the purchase of $150,000 additional automatic central office equipment and instruments. It is stated further: "During the year authority was received for the issuance of an additional $200,000 bonds, making the total outstanding in the hands of the public $931,000, the increase of $106,500 being occasioned entirely by the exchange of this company's bonds for like amount of bonds of subsidiary companies, the Citizens Telephone Company, Jackson, and Citizens Telephone Company, Battle Creek. This exchange was made in anticipation of early maturity of these bonds. During the year the Jackson and Battle Creek companies defaulted on their bond interest and on such bonds as have been previously guaranteed by this company the interest coupons have been purchased.

A relatively small amount of the company's stock has changed hands during the year. There being a total of 3,000 stockholders, as compared with 3,024 of the previous year. The comparative statement of earnings and expenses, and a comparative balance sheet follow:

	Year Ended Dec. 31, 1920	Year Ended Dec. 31, 1919	Increase or Decrease

J. W. MURRAY MFG. CO.

The J. W. Murray Manufacturing Company, Detroit, has favored this paper with copies of the balance sheets of December 31, 1920, for both the parent company in Detroit and the Murray Ohio Manufacturing Company, Cleveland.

The parent company shows a growth in total assets, compared with balance sheet, December 31, 1919, of $659,861.25, and a total increase in net surplus account of $79,826.92 after payment of dividends and taxes. Current assets total $1,019,465, against current liabilities of $421,525. The exact holdings of the Ohio company's stock by the Detroit company is not explained in the information furnished, but it is noteworthy that whatever that interest may be is carried as $1. Below is given a condensed comparative balance sheet of the Detroit company and a condensed balance of the Murray Ohio company:

J. W. MURRAY MFG. CO. STATEMENT

ASSETS	Dec. 31, 1920	Dec. 31, 1919

E. W. BLISS CO. REPORT

The E. W. Bliss Company, Brooklyn, N. Y., and Hastings, Mich., during 1920 earned a profit of $2,376,338 after depreciation and federal tax deductions. This compares with $1,855,524 in 1919, $1,271,353 in 1918 and $2,339,925 in 1917. After taking care of dividends, net surplus for the year ended December 31 was $1,646,838, as compared with $1,192,024 in 1919, $577,603 in 1918 and $1,614,295 in 1917. Including previous surplus, the company's total surplus on January 1, 1921, was $18,925,133, while a year ago it was $17,274,080.

In the report to the stockholders it is announced that the company has $2,500,000 of machinery orders on its books, not including special work for the Government, which consists of making torpedoes. This Government work amounts to about $1,000,000 a month. It was also stated that the business is improving, owing to the pick-up in the automotive industry.

COMMONWEALTH POWER REPORT

Net earnings for the month of February, 1921, reported by Hodenpyl, Hardy & Company, for the Commonwealth Power Railway & Light Company and subsidiaries, were the largest of any February of the last four years. Out of gross earnings of $2,633,699 there was paid operating expenses, taxes and maintenance of $1,748,422, fixed charges of $613,099 and dividend on preferred stock of $89,765, leaving a net of $182,412, compared with $91,147 in 1919 and $102,909 in 1918.

The burglar-proof vault in the Maynard-Allen State Bank, Portland, has been completed. The vault is equipped with two alarms, which, if sounded, will arouse the town.

MANAGED BY MEN YOU KNOW

Why Stake Your Family's Security on Human Frailty

Not a week passes but fresh evidence appears of the imprudence of appointing an individual executor or administrator.

Friends, though well-intentioned, often make costly mistakes through inexperience. Some prove subject to influence, and prejudice creeps into the management, with resultant quarrels.

Far better, mature business men decide on consideration, to appoint an impartial, trained agent such as the Grand Rapids Trust Company, proof from human ills.

A booklet prepared on this subject will prove interesting. Send for copy.

Michigan Bond Items

Sixty thousand dollars of sewer, water works extension, highway improvement and drainage improvement bonds will be sold to the highest bidder by the city of Bad Axe, at 7:30 p. m., April 18, at the council rooms. Sealed bids, accompanied by a certified check for $500, will be received up to that time. Circulars will be furnished prospective bidders on application to James A. Burgess, city recorder.

Frank F. Rogers, state highway commissioner, will receive bids up to 1:30 p. m., April 6, for the sale of road assessment district bonds as follows: Road assessment district No. 177 in Barry and Kalamazoo counties. Approximately $60,000 worth, maturing serially in from two to seven years. Bonds are the obligation of Prairieville and Barry townships in Barry county; Richland township, Kalamazoo county; the counties of Barry and Kalamazoo and an assessment district. The bonds are being issued under the Covert Act. Interest will be payable semi-annually on the first day of May and November in each year. Each bidder will be required to name the rate of interest, not exceeding 6 per cent and premium for each thousand dollars he will pay, in his bid. A certified check in the sum of 2 per cent of the amount of the bonds bid on, payable to the order of the state highway commissioner, will be required with each bid. The right is reserved to reject any or all bids.

The Lansing city council has been requested to withdraw the bond issue of $3,825,000 to be voted on this spring to provide equipment and build an electric light and power plant. The request was made by Otto Ziegler, president of the board of water and electric light commissioners, in view of the failure of the legislature to pass the bill making it legal for the city to bond for such a large amount.

Howe, Snow, Corrigan & Bertles are offering $50,000 first mortgage 5 per cent bonds of the Kanawha & West Virginia Railroad to yield about 7 per cent. These bonds mature July 1, 1955, and are represented as legal for Michigan savings banks. Principal and interest are guaranteed by the Kanawha & Michigan Railway Company, a subsidiary of the New York Central system.

George M. West & Company have $12,000 Highland Park, Mich., 4½ per cent school bonds maturing July 15, 1924, for sale on a basis to yield 5% per cent.

Bonbright & Company are offering $1,000,000 Denver Gas & Electric Company 25-year general mortgage 7½ per cent gold bonds due in March, 1946, at 96, to yield more than 7.85 per cent.

Detroit Stock Exchange

During the week of March 24 to 29, inclusive, 19,194 shares of listed stock and 85,833 shares of unlisted stock were traded in. Sales of Detroit Edison debentures due in 1940 were $3,000 at 79¾, and of Detroit Edison debentures due in 1931, the most recent issue, bearing 8 per cent, were $1,000 at 102. This latter figure is a high mark. Detroit & Port Huron Short Line 5s of 1950 are in somewhat better position, being quoted at 75 bid 75 asked, as compared with 62-68 last week. Detroit, Ypsilanti & Ann Arbor 6s due in 1924 are 79 bid, 85 asked, as compared with no bid and 100 asked last week. Eastern Michigan Edison 5s due in 1931 have advanced from 78 bid to 81 bid. Detroit & Suburban Gas 5s due in 1928 are up to 81 bid, as compared with 78 bid the previous week.

Liberty bonds have not changed appreciably since last week with the exception of the second 4¼s, which sold at $87.02, March 29, as compared with $86.82, March 22.

Paige-Detroit made a new high of 25¼ during the week under review, climbing from 23¾ a week ago, and Packard common made a new high of 13 over previous high of 12. Charcoal preferred dropped to 2¾ from 3, the last low for 1921, and National Grocer stepped down to 7⅝ and 8¾ the last previous low sale.

Bank stocks have been very inactive.

Capital Assets Sales Held Subject to Income Tax

The Government, by a decision of the Supreme Court this week, won one of the big suits growing out of the income tax laws. One hundred millions will be kept in the Treasury as a result. The court held constitutional a provision of the law providing that a profit derived from the sale of capital assets—stocks, bonds or other securities—is income and therefore taxable.

The court's decision was given in the appeal of David M. Goodrich from a ruling of the Internal Revenue Bureau assessing him on the increased value of stocks bought prior to 1913. Action of the revenue officials was affirmed by the Supreme Court.

Increase in the value of corporate bonds originally acquired and held for investment is taxable under the Revenue Act of 1916, the Supreme Court also ruled.

Profits realized from the sale of assets of a trust fund are taxable under income and excess profits law, the Court also held. The decision directly affects several cases not in litigation and indirectly affects thousands of trust funds. It was given in the appeal brought by the Merchants Loan & Trust Company as trustees of the estate of Arthur Ryerson, a citizen of Illinois.

Ryerson left as part of his estate capital stock in the firm of J. T. Ryerson & Sons, valued at $560,000. Four years after his death this stock was sold for $1,780,000, and the cash obtained was added to the estate. The Government imposed a tax of $311,000 on the increased value.

COMPANIES AND DEALERS APPROVED

The following companies and dealers were approved by the Michigan Securities Commission at its meetings February 3, 10 and 24:

Companies—Superior Combustion Engine Corp., Detroit; Northeast Lumber Co., Detroit; Lahontan Valley Sugar Co., Bay City; Grand River Washed Sand & Gravel Co., Ann Arbor; Belik Brothers, Inc., Detroit; Sterling Finance Corp. of Michigan, Flint; J. W. ANOTHER BANK FOR DETROIT

The Merchants & Mechanics State Bank is the latest prospective addition to the financial family of Detroit. This institution, which is in process of formation, is now building a handsome structure on Michigan avenue, near Junction. The creative energy behind the movement is Wayne C. Plummer, formerly assistant cashier of the Federal State Bank and later of the Commonwealth-Federal Savings Bank.

NOBLE EXPLAINS NOTE ISSUE

Charles F. Noble, president of the Charles F. Noble Oil & Gas Company, addressed a meeting of Detroit brokers last week at the Detroit Athletic Club, discussing the company's plans for issuing $3,000,000 of first mortgage, 10-year, 8 per cent bonds, the proceeds of which he says, are to be used in purchase of oil properties on which the company holds options. It is planned to retire the bonds $600,000 annually, beginning October 1, 1923.

BOND OFFERING

The city of Bad Axe, Michigan, will offer $60,000.00 of sewer, water works extension, highway improvement and drainage improvement bonds to the highest bidder at 7:30 p. m., April 18, 1921, at the council rooms. Sealed bids accompanied by a certified check for $500.00 will be received up to that time. The bond proceedings are approved by Miller, Canfield, Paddock & Perry, Bond Attorneys, Penobscot Bldg, Detroit. Bond circulars furnished on request. James A. Burgess, City Recorder.

Detroit to Build This Year, But–

(*Continued from Page 4*)

of indebtedness and other tax-exempt securities into building channels.

This brief reference to tax exemption of profits accruing from building investments brings us to the third of the trinity of financial sources for building loans. Considerable private money finds its way into building activities through mortgage investment houses and individual loans to preferred creditors. Taxation is the main reason why more does not go into this channel.

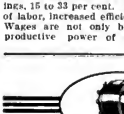
Sometime ago a loan association operating in Michigan proposed to a number of Detroit capitalists that they invest from $25,000 to $50,000 in the association at 5 per cent interest so that there would be more money for home building. The proposal was treated coldly for the very reason that tax-exempt securities offered better investments. it was pointed out to these men that their aid would go a long way toward relieving the housing shortage, but apparently they were not interested in the home problem. Much more could be said regarding the financing problem, but it is the opinion of the writer that what has been said must show that the money phase of this subject is the most important, and its character militates against any possible "building boom."

The Other Side of the Picture

So far it may seem that we have been striking a rumor key in this discussion, but the scheme has been to produce the cloud in its darkest aspect before pointing out the silver lining.

In 1920 the total building program of Detroit, as represented by permits issued, called for an expenditure of $61,895,860 for new structures of all kinds. Of this amount, $25,837,130 was invested in construction of buildings either only for homes or having home facilities attached. This provided 5,826 homes in a city where the estimated need is 25,000. The building program for industrial purposes laid out for the year would have involved about $20,000,000, but in reality about $12,000,000 was done.

Judged by the 1920 schedule, there remains more construction work to be done than has been done in any year. It has been reported that soon there will be released $10,000,000 of construction work. This may or may not include the $8,000,000 left over from last year. When an investigator goes out to round up actual figures, he can have his choice of any number of estimates, but it is difficult to get an agreement, or proof to support any of the claims.

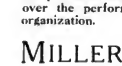


Of the $8,000,000 of industrial construction left over from last year, how much will be continued this year is an open question. One can say, for the sake of being optimistic, that all of it will be done, while another will ask why it is necessary in the face of present and future industrial activities. No one who has studied the industrial situation can disregard the fact that in a great many lines of industry the facilities expanded during and immediately after the war are more than adequate for any potential demand that may come with the revival of business. This being the case, how many plants will proceed to increase their floor space with no certainty of demand for more than present facilities can produce?

In a city like Detroit, industrial building continues year after year, even in such periods as we have with us now, but the kind of development we refer to is normal as judged by the mean of the building volume over a period of years—say 10 years. When one year's construction exceeds every other year, and any one year by a large margin, then the term "building boom" may be applied. The year 1920 started out to exceed 1919, but the collapse in the last few months brought it below 1919. All that can be looked for now is a gradual recovery, which will take five years, according to some builders.

Something Tangible Here

When we get into the home building phase of the problem we have something tangible and certain to deal with. Despite the exodus of the unemployed, there still remains a large percentage of the 25,000 homes as an imperative need. The cry has been: "Down with building costs!" And they have come down. Rough lumber has dropped from $75 to $45 a thousand feet. A review of the quotations of other materials shows from 35 to 45 per cent decreases. Labor has dropped. Plasterers and bricklayers were cut April 1 from $1.12½ to $1 an hour. Common labor is offered now at 40 cents an hour.



One builder estimated that a $20,000 house of last year could be duplicated this year for $17,000, and gave as an approximate decrease in the construction costs of all types of dwellings, 15 to 33 per cent. In considering the cost of labor, increased efficiency must be included. Wages are not only being lowered, but the productive power of labor has increased.

SIX feet of earth conceals the errors of many a physician. Several feet of masonry may hide the defective work of an electrical contractor.

No post-mortems need be held over the performances of this organization.

MILLER-YORK
INCORPORATED
133-135 WEST LARNED STREET
DETROIT

C. M. SMITH MANAGES BRANCH

The Peoples Savings Bank, Grand Rapids, which recently opened a branch in the building formerly occupied by the Farmers & Merchants Bank of Madison Square, has appointed C. M. Smith, a member of the bank's staff, as manager of the new office.

NEW PEOPLES STATE VAULTS

On Thursday, March 31, the Peoples State Bank, Detroit, opened to the public its largely increased safety deposit vaults, which are said to be the largest in the city.

A. A. McPherson is a new assistant cashier of the Bank of Detroit.

Digitized by Google

Naturally when materials cost less and labor costs less and is more efficient, that is the time to build. When building activities are lessened, then is the time to proceed with construction plans, for the reason that the pick of contracting ability is to be had and a higher quality of work is certain. Contractors have time and desire to give a greater value in attention to service than is possible with such competitive buying conditions as we have recently witnessed.

The tendency to think in extremes may lead many prospective builders to believe that by waiting a while prices of materials, labor and professional service will go "way down, but in so figuring they are not considering the position of Detroit in the galaxy of great cities. It is well to remember that Detroit today occupies third place in building; that it leads Philadelphia and is not far behind Chicago. It is recognized as one of the first large cities to show marked evidence of recovery from the general slump, and that despite the fact that it is largely a one-industry city. If a city with an industry that has received such a setback as the automotive business can start on the journey back to health, there is something beneath the surface of that city's economic life that is quenchless.

Railroad Rates a Factor

There is a large question of just how far the prices of any commodity can fall in view of the present railroad rates. Here we have a situation in which one bad condition gradually is being improved as another shows itself. The revival of industrial and commercial activities largely dependent upon revision of prices, wages, profits and production would be speeded up ordinarily because of the improvement in transportation and the plentiful supply of cars, but the cost of carrying all kinds of building materials will be far greater than ever before. Such reductions in the cost of production at the plant, and the resultant cut in prices, will be offset to a certain extent by the higher freight rates.

Here again Detroit occupies a favorable position, inasmuch as considerable building material is produced in the state, and while the freight rates are just as great here as elsewhere, the distances are not, and if there is any margin of saving Detroit can get it.

Referring again to materials prices, not all of them have shown marked decreases. Brick, for instance, is offered at $18 a thousand, lower than formerly, but not low enough, in the estimation of builders. Plumbing supplies show little or no decrease. Some electrical goods are cheaper. A real estate man calls attention to one improvement, which is the return to flat estimates after a long period of cost-plus figuring. If it is possible now to get a contractor to set a figure at which a building can be constructed, prospective builders will go ahead. With a cost-plus proposition staring him in the face the humble builder of a roof tree cannot be expected to sit in the game.

To sum up, then, the building industry has in its favor lower materials prices, lower labor costs with increased productive desire, the imperative need of more homes, some industrial building, the usual volume of repair and alteration work that comes every season, sources of supply near enough to offset to some extent the increased railroad rates, and a field of effort so large and so rich that, whereas financial limitations may affect a certain percentage of potential builders, there still remains a large class of prospects with the accumulations of a highly profitable two years, sufficient to provide a surplus for building.

But as to a building boom and another period of price-kiting—one is a state of mind; the other would be suicide.

Hudson has a new industry. It is the Southern Michigan Brass Foundding Company, capitalized at $15,000. The incorporators are Richard Allingham, William O'Brien and G. G. Taylor.

(*No. 4 of a Series of Examples*)

Is a Corporation Liable for Fraudulent Over-Issues of Stock?

Yes. A corporation is liable to a bona fide holder of forged certificates of stock, legal on their face, but fraudulently issued by an officer of the company acting as its Transfer Agent and who countersigned them in his official capacity after forging the signature of the President.

It is also liable when its Transfer Agent fraudulently issues stock without requiring the surrender of the old stock certificates.

We will be glad to explain the precautions we take as Transfer Agent to guard against fraud, mistake or any irregularity that might affect the validity of a transfer or result in loss to our principals.

Is Your Money Efficient?

Mechanical efficiency is defined as the "ratio of energy-obtained to energy-exerted." Apply this definition to your investments. If the dollar you invest requires energy disproportionate to the money returned, your investment is inefficient. If you are receiving less than 6%, your investment mechanism needs lubrication. If you are striving for more, you are racing your motor.

Our First Mortgage Bonds offer a perfectly balanced ratio.

The Legislature As a Pawn in a Game

(*Continued from Page 4*)

the existing conditions, in freight charges or passenger fares, and under government operation. If that is the eventuality—forcing the railroads into the hands of the Government—either in freight charges and passenger fares, or perhaps partly in taxes to make up the deficits.

"I have before me the statement of the gross revenues, operating expenses and fixed charges of the principal lines operating in Michigan for the months of January and an estimate of what they will amount to in most cases for the month of February, which are taken, in the case of the former from the compilations for the Interstate Commerce Commission. These give us some idea of the precarious conditions the transportation lines have come into under the multiplicity of laws, national and state, national wage agreements, etc., at this time, when there is a decided recession from normal economic conditions. They are as follows:

Pere Marquette—January

Gross revenue	$ 2,494,553.72
Operating expenses, taxes, etc..	2,615,077.51
Deficit for January	$ 210,523.79

February

Estimated earnings	$ 2,186,556.00
Estimated expenses, taxes, etc...	2,760,000.00
Estimated deficit for February..	14,000.00

Grand Trunk—January

Gross revenue	$ 2,086,648.00
Operating expenses, taxes, etc..	2,529,007.02
Deficit for January	$ 442,361.02

February

Estimated earnings	$ 1,519,266.00
Estimated expenses, taxes, etc...	1,809,420.00
Estimated deficit for February..	$ 290,154.00

Detroit & Mackinac—January

Gross revenue	$ 133,929.87
Operating expenses, taxes, etc...	176,100.53
Deficit for January	$ 42,170.71

February

Estimated earnings	$ 130,000.00
Estimated expenses, taxes, etc...	167,000.00
Estimated deficit for February..	$ 37,000.00

Duluth, South Shore & Atlantic—January

Gross revenue	$ 352,938.97
Operating expenses, taxes, etc-..	488,968.10
Deficit for January	$ 136,123.13

February estimates are not available.

Minneapolis, St. Paul & Sault Ste. Marie—January

Gross revenue	$ 3,212,514.87
Operating expenses, taxes, etc...	4,187,023.94
Deficit for January	$ 574,614.57

February

Estimated earnings	$ 3,047,000.00
Estimated expenses, taxes, etc..	3,847,000.00
Estimated deficit for February	$ 800,000.00

Mineral Range—January

Gross revenue	$ 38,278.30
Operating expenses, taxes, etc...	69,070.26
Deficit for January	$ 30,791.90

Estimate for February is not available.

Chicago & Northwestern—January

Gross earnings	$11,789,895.98
Operating expenses, taxes, etc...	12,968,798.70
Deficit for January	$ 1,179,302.16

Estimate for February is not available.

Lake Superior & Ishpeming—January

Deficit for January	$ 53,258.16

Manistee, Marquette & Southeastern—January

Deficit for January	5,604 67

February estimates for the above two roads are not yet available. These roads are ore roads and their business is largely during navigation, so their winter operating ratios are necessarily out of balance with other railroads of the state at this season.

Ann Arbor—January

Gross revenue	$ 447,344.66
Operating expenses, taxes, etc.	457,996.56
Deficit for January	$10,651.90

February

Estimated deficit for February..... $10,000.00

Michigan Central—January

Deficit for January	$ 109,000.00
Estimated deficit for February..	$85,000.00

"I have the complete figures before me for the Pennsylvania and the New York Central Lines, but it is a known fact that both of these railways lost heavily in both January and February.

"Now, since it is seen that all of these railroads have lost heavily for several months, it can readily be appreciated that any adverse legislation such as is proposed will only serve to add further burdens, which in the end must mean receiverships or the taking over of the lines by the Government. If the taking of these lines into government control is the end and aim of the measures, why hide their real motive? The alternative is to come out in the open and allow the people of the United States to decide the issue whether government ownership is desired. Let us get a clear-cut pronouncement upon this question, if that is what is so heartily wanted in certain quarters.

"It seems to me, therefore, that the Michigan Legislature and many other of the state legislatures are being used as pawns in a great national chess game with government ownership as the goal."

STATE-WIDE AIR SERVICE

The Michigan Aero-Service Corporation, which was recently organized in Lansing to give state-wide commercial service, will start operations about May 1. The company has purchased 15 airplanes and eight of these have been shipped. The corporation is headed by Beirdt P. Ayres, Lansing, and, with headquarters in Lansing, branches have been established in Detroit, Jackson, Battle Creek and Muskegon. The corporation is the largest of its kind in the state and will handle passenger traffic, express service, aerial photography, advertising and stunt flying, and in addition will supervise a sales organization. Only pilots and mechanics of at least three years' service will be employed.

Safe Deposit Vaults

Financial Strength

When the Michigan Mutual started business in 1912, it had nothing to offer its prospective patrons but a sound insurance plan to supply compensation insurance at actual net cost.

Today it offers YOU that same sound plan, backed by resources of MORE THAN TWO MILLION DOLLARS to guarantee you perfect security.

The following figures show the company's growth in this vitally important element of financial strength:

ASSETS	
Dec. 31, 1912 -	$6,799
Dec. 31, 1913 -	$74,573
Dec. 31, 1924 -	$133.760
Dec. 31, 1915 -	$139,003
Dec. 31, 1916 -	$282,821
Dec. 31, 1917 -	$533,735
Dec. 31, 1918 -	$1,155,192
Dec. 31, 1919 -	$1,725,245
Dec. 31, 1920 -	$2,516,880

Write for "The Motive of the Mutual," a booklet giving full information about the company. A postal will do.

HOOVER STEEL BALLS

INTERNAL transportation gains in speed and flexibility when bearings built on Hoover balls are used on shafts and axles to defeat the effects of friction.

Polished to a flawless gleaming finish and each an absolutely perfect sphere, Hoover balls permit each precious ounce of power to function gainfully. Then, too, their life is limitless, for after being hardened the Hoover process, they exhibit a rare ability to withstand the grueling test of heavy load combined with unexpected thrusts and sudden shocks.

HOOVER STEEL BALL CO.
ANN ARBOR, MICH.

Branch Offices:
Chicago Cleveland New York San Francisco
Southern Representatives
Sanford Brothers, Chattanooga, Tenn.

Hoover balls are counted mechanically to prevent their highly polished surfaces from becoming rusted by being handled. Each stroke of the counting plate withdraws 100 balls from the hopper. Subsequently the balls are packed in non-oxide grease and securely boxed for shipment. (S)

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

Detroit's Future Money Supply

Why Funds Are Not Flowing Into This Metropolis In As Great Volume As They Should; the Remedy

By PHIL S. HANNA

[*Financial Editor, Michigan Manufacturer and Financial Record*]

NOTWITHSTANDING the potency of things in Detroit generally and the fact that millions are being spent by many firms and institutions and individuals, the so-called "open market" for money for building houses and like private enterprises is going to need attention. Every large country and every new city during its development period has had to rely on outside sources of money supply. Now of course Detroit is far from being a new city in point of years, but it is new industrially and it will be some years, no doubt, before the savings and investments of the home people are sufficient to furnish capital for the entire needs of the city.

Aside from capital raised by the municipality and corporations privately, all during the war and for several years prior thereto there was a considerable influx of new money into Detroit. Some of it came in the pockets of laborers, some was left by tourists who were impressed with the speculative possibilities of Detroit real estate, but of course the largest source of saved-up funds was brought along by newcomers in the form of transferred savings deposits from their home banks. And to these funds were added the normal savings of thousands who were profitably employed, so that the money supply for the city kept pace with the demand until inflation set in along in 1919, and the city, through the medium of the Reserve banks, borrowed heavily.

Although the figures have not been made public, well informed bankers know that the banks in the district served by the Detroit branch of the Federal Reserve Bank of Chicago have been borrowing more, for some time, than their quota of Reserve Bank credit as based on the reserves which banks in this district keep on deposit with the Reserve institution.

Slow Postal Service a Handicap

Now, the point needing emphasis is this. Detroit as a bank reserve city occupies a peculiar position. In many respects the position is very advantageous and again there are drawbacks in the way of obtaining as great a proportion of the bank reserve deposits of the surrounding country as Cleveland, Pittsburgh, Chicago and other such reserve cities control in their districts. Cleveland, for instance, has for years had the benefit of an enormous inflow of outside money, due to the "bank by mail" activities of what used to be her largest bank, now consolidated into the Union Trust Company. Furthermore, Cleveland draws intensively east, west and south for more than a hundred miles on the reserves of the country banks in that semi-circle. Detroit, unfortunately, has no such unmolested advantage. Toledo cuts into the country bank business on the southwest and it draws business away from Detroit, starting at a line drawn from Monroe westerly to the Ann Arbor railroad. Owing to the directness of postal service on the Ann Arbor, many towns up in central Michigan make the Toledo banks their main correspondents. In the southwestern, western and northwestern part of the state the railroad connections with Chicago draw much of the bank business to the Windy City, and in the Upper Peninsula the business is very largely shared among Chicago, Duluth, Minneapolis and Milwaukee.

We don't often hear in mind the important part which railroad service plays in determining the flow of country bank money to reserve cities. Along the Grand Trunk main line Chicago pulls heavily as far east as Port Huron because of quick overnight service in mail delivery and equal advantages in currency delivery. Flint is linked closely to Detroit because of long standing personal relations between the bankers in the Vehicle City and Detroit, but nevertheless if Detroit had service on its radiating railroad lines equal to that given by Chicago much business now going to the latter would come here.

The writer had a close-up of the service between Detroit and Mount Clemens about six months ago which shows the great disadvantage Detroit is under in this matter. A Detroit bank habitually sent its cash letters to Mount Clemens, posting them about 6 p. m., but the Mount Clemens bank seldom received this mail until too late for the following day's clearings—often it was afternoon when the letter arrived in Mount Clemens—and as a result the checks on the other Mount Clemens banks had to be held over and presented the third day. Returns were thus mailed back to Detroit the third but often were not delivered in Detroit until late the fourth day—so late, in fact, that occasionally "N. G." checks returned by Mount Clemens were not delivered to the indorsers until the fifth day. And Mount Clemens is only twenty miles from Detroit. Detroit bankers will testify to many similar cases on other points in Michigan. Similar cash letters are commonly sent from Chicago to points in Michigan, and vice versa, in less time than from Detroit. Port Huron, 336 miles from Chicago, has an overnight service which enables the Port Huron banks to get credit the second day for items sent to Chicago, and reversely Chicago banks get returns the third day from items sent to Port Huron. This puts Chicago on a par with Detroit, which is only 58 miles away. This is true of Flint, which is 270 miles from Chicago, and Lansing and Grand Rapids.

The table given below shows several points in Michigan which geographically and otherwise are naturally within Detroit territory, but many of which, by reason of quicker and better postal service, give the bulk of their bank business to Chicago and Toledo, which are further from them than Detroit.

City	Dist. from Detroit (Shortest R. R. route)	Dist. from Chicago (Shortest R. R. route)	Dist. from Toledo (Shortest R. R. route)
Port Huron	58 miles	336 miles	... miles
Flint	74 "	270 "	... "
Lansing	87 "	231 "	... "
Saginaw	104 "	310 "	... "
Bay City	121 "	328 "	... "
Grand Rapids	153 "	177 "	... "
Kalamazoo	143 "	141 "	... "
Hillsdale	103 "	178 "	88 "
Adrian	68 "	211 "	28 "
Hudson	50 "	194 "	50 "
Mt. Pleasant	126 "	... "	154 "
Ashley	100 "	... "	128 "
Alma	117 "	... "	145 "
Sturgis	149 "	133 "	113 "
Battle Creek	120 "	164 "	... "
Jackson	74 "	109 "	... "

The amount of up-state bank reserves which ought to be deposited in Detroit banks by reason of location, but which is going to Chicago and Toledo, is difficult to figure closely, but one may draw this comparison with Cleveland, which is not as large as Detroit in population, but which has about $100,000,000 more in bank deposits.

We have therefore it seems two fairly acceptable reasons why Detroit is going to need to look outside for money. Just at present the foreigners going to Europe, and the strodus of some of the shop workers, is drawing down savings deposits, but this is a perfectly normal proceeding, which eventually will be offset by the deposits of the newcomers and the increased savings of those now employed.

Some Other Factors

There are other factors which play a more or less important part in the determination of country bank depositaries. For instance, Cleveland pays 4 per cent on time certificates and 3 per cent on reserve accounts and Toledo banks do the same, while the rates in Detroit for similar classes of deposits are 3 per cent and 2 per cent respectively. The county banker figures the difference in his yearly earnings very closely under the two different arrangements and many are influenced therefore to send surplus funds to one or the other competing cities. Moreover, since the Federal Reserve Act has been in force it has been the more necessary to discriminate in selecting reserve depositaries (correspondents) owing to the fact that member banks are required to keep 7 per cent of commercial deposits and 3 per cent of time deposits (savings) with the Federal Reserve Banks, on which sums they receive no interest. Many country banks, on becoming members of the Federal Reserve System, found it necessary to reduce the number of their correspondents, and it was perfectly natural for them to eliminate the account which paid the smallest returns, which operation, it is believed, has tended to send

Digitized by Google

acme money to Toledo and Cleveland that should come to Detroit.

Another factor which used to work against Detroit was the policy of the Ford Motor Company in maintaining bank accounts in other centers. The extent to which this obtains at present is not pointed out, but it is clear that if the aggregate bank balances of the Ford company belonged, for example, to twenty individual companies, a much smaller percentage of the aggregate cash would be kept outside of Detroit. Financial writers for Eastern papers have often made capital of the stories that the Ford bank account was so large that Detroit banks had to refuse deposits, which may or may not have been based on fact, but I have yet to meet a banker who would refuse a large bank account if the same were offered on any reasonable basis. It is true that a widely fluctuating large deposit account is unprofitable if a greater rate of interest is paid on it than the interest received from a bank's own correspondent less handling costs, for a bank cannot invest a million dollars today even in the highest grade short-term paper and then be required to convert most of it into reserve the next day to take care of withdrawals, and make any money. But as a rule depositors of the size of the Fords have access to the same paper that banks purchase for short-term investment and commonly buy such paper rather than place money on checking account if they know the funds are not going to be needed immediately.

So the big point, then, in the discussion of this feature of the matter is whether twenty individual corporations in Detroit having an aggregate of $20,000,000 to deposit would keep a greater percentage of that fund in Detroit banks than one corporation like the Ford company might do with an equal amount for deposit. I am strongly inclined to the opinion that Detroit banks collectively would receive a greater portion of the assumed $20,000,000 deposit if it belonged to twenty individual companies, for the time-honored principle of "keeping one's eggs in one basket" does not come so quickly into consideration in each of twenty owners of $1,000,000 as it might with one company owning $20,000,000, aside from all the other reasons of expediency which any company doing a nationwide business might take into consideration.

The Borrowing Limitation

And there is also the borrowing limitation which operates against a large depositor as well as the small. The rejection of a large salary bank is commonly made with a view of the ability of the bank to extend credit, and although any discussion of the Ford's company's borrowing instead of its funds in view of the reams of hypothesis lately published we may just as well go on with the discussion, assuming that the Ford company is ruled by the same economic laws as the rest of the business world. So, taking again the twenty individual depositors with $1,000,000 each, we find that regardless of any rejection of each separate bank or all go to the same bank, the laws do not prohibit the banks selected from granting each one a full line of credit. For example we will say that the bank selected by all of the twenty companies has $5,000,000 capital and $5,000,000 surplus. Now under the national law each company could obtain a normal line of credit of $1,000,000, making an aggregate lending capacity to the twenty concerns, $20,000,000, which no doubt would be acceptable to each individual company. But suppose instead of twenty companies we have only one corporation to consider. In this case the legal limit that the bank could grant would be precisely the same, $1,000,000, and to whatever extent the corporation in question desired a larger line of credit than this it would be necessary for it to turn to other banks. And, legally, if every bank in the city extended the corporation a 10 per cent line of credit, an aggregate of $5,250,000 could be borrowed without going away from home.

It might be explained here that state banks may lend up to 20 per cent of capital and surplus to one corporation under certain circumstances, which would bring the aggregate line of credit up to $9,150,000, but the national bank limit of 10 per cent of capital and surplus is the one more commonly followed.

But a concern like the Ford probably would not apply to every bank in town for a line of credit, neither would it be apt to deposit all its funds in fifteen banks in the home town.

HOUSE OF DAVID WOULD LIKE TO KNOW

THE Detroit Automobile Show was not without its comedy.

A learnedly talking brother of the House of David, Benton Harbor, with a chin unscathed by Gillettes or Ever Readys, lingered long around the chassis of the Stearns. He gave the differential a careful scrutiny, looked over the universal joint carefully and put his ear down close to the engine. After crouching in seeming communion with the slowly pulsating pistons he took out paper and pencil and wrote down the following query which he handed to the salesman: "What is the ratio of the total volume to the piston?"

The best answer gets a brown derby.

Seamen's Act Conference In Progress in Detroit

Representatives from all the states bodering on, or within short hauling distance, of the Great Lakes are in Detroit for the conference on the LaFollette seamen's act, the provisions of which have operated to drive freight and passenger boats from the Great Lakes routes. The conference opened Friday at the Board of Commerce. A tentative bill modifying some of the requirements of the act, drafted by the Board of Commerce committee, was considered at the conference. If this or some other amendment is sent to Washington from Detroit, delegates will be asked to attend the Congressional hearings in Washington.

MICHIGAN RAILROAD EARNINGS

Earnings of the Michigan Central Railroad Company during the first two months of this year totaled $1,084,045, as compared with $1,192,992 for the corresponding period a year ago. The net income after taxes was $476,952, as compared with $1,347,971. Net operating deficit after taxes of the New York Central for the same months of this year was $687,159, as compared with a net operating income of $1,121,671 in 1920 for the corresponding period. The Detroit & Mackinac reports that gross earnings during February were $120,943, while a year ago they totaled $134,788. The net operating deficit after taxes was $28,696, as compared with $39,657 a year ago.

CALUMET & HECLA LOSS

The Calumet & Hecla Mining Company reports a loss of $3,823,743 for 1920. The operating loss was $526,051, to which was added a reduction of copper on hand to 18 cents a pound, the current market price.

For reasons of business expediency we might expect to find such a company with two or three Detroit accounts, one or two in Chicago and New York and some in other large centers withina which it may be doing considerable business, whereas twenty individual concerns having a combined bank account of the same size as the Ford company might naturally keep all the money in Detroit.

We have, therefore, in the instances advanced in the foregoing a reason why the Detroit money supply as furnished by the banks is not all that it might be were postal service out of Detroit as good as that out of other centers which control the country bank business, if rates were as favorable to outside deposits and if our largest depositor's money were split up into smaller units of ownership. But whether or not these reasons account for the $100,000,000 difference in deposits between Detroit and Cleveland, there is going to be sharp competition for capital notwithstanding, and if it does not flow to Detroit of its own natural bent, steps should be taken to attract it from other centers.

How to Attract It

In this connection note that the Federal Land banks soon will issue from $50,000,000 to $75,000,000 of farm loan bonds, that the War Finance Corporation has been revived and is going to extend a few millions of credit, both of which operations mean in the end that the United States Treasury will furnish the money. And the Treasury will get the money from the Federal Reserve Banks on U. S. Certificates of Indebtedness which will amount to a restoration of the unhealthy competition between government and business for available bank credit. And before long, too, the Foreign Trade Financing Corporation will be going to the people, as it should, with millions perhaps of debentures. No, we see no prospect of very cheap money right away with both government and business bidding for the credit-tough pelf mell and no unsolicited flow of private funds to Detroit.

But Detroit can and will get considerable money from other parts of the nook and corner of the United States if the proper campaign for it were put on. The business depression has demonstrated to people all over the United States that the automobile industry has greater and quicker recuperative powers than many so-called "staple" lines of manufacturing, and the sooner that the public is protected, according to the proverb, has now become the cornerstone of the temple. For the same reason that bankers used to refuse credit they now grant it in preference, namely, that the willingness of the people to pledge their last dollar for an automobile gives that industry a considerable advantage. Similarly, in December, when there was a blanket of indigo over everything businesswise, a prominent wholesale clothing manufacturer in Chicago bewailed the fact that he was unable to get people making automobiles instead of being in Chicago making clothes, and upon being questioned as to his reasons, said: "The people of the world want automobiles first, and food and clothing come second, and the manufacturer who makes any article that the people will put ahead of food and clothing is bound to be the least affected by depressions and the first to recover."

It would seem to the writer that a desirable activity for the Board of Commerce of Detroit to undertake immediately would be a campaign of publicity, conducted in conjunction with the banks and bond houses and other financial institutions, to obtain a new flow of private outside capital into Detroit. In so doing the world might be apprised of some facts that have often been distorted by interest which are jealous of the city's progress. We are witnessing a revival just as this is written that will open the eyes of thousands of investors, and the facts properly presented should establish a new confidence in Detroit and Michigan throughout the length and breadth of the land.

Research, the Bond Between the University and Industry

A Discussion of the Relationship That Should Exist Between the Manufacturer and the U. of M.

By A. E. WHITE
Director, Department of Engineering Research, University of Michigan

RESEARCH has been accepted and accredited as a function of our schools and colleges since their very establishment. Even in the days when Latin and Greek and philosophy and theology were the main subjects in the curriculum it was duly recognised that further study in these fields into nooks and cranies still unknown—namely, research—was a fundamental and necessary function for the instructor. We had research with us then, we have it with us today and if history permits of prophesy, we will have it with us until Gabriel sounds his trumpet and summons us all to that great beyond.

Thus research is no new thing. It is no untried thing. That which is new is the modern concept of it, a concept which believes that greater attention should be directed in our universities and colleges to those phases of research which will mean greater employment and greater prosperity to the people. There are those in our midst who feel that such a concept is not in keeping with the best traditions of our schools. They feel that our research, whether in the philosophical or natural sciences, should be abstract, intangible. They fear the possible screditing effect of money, since they believe that attempts will be made to use research for the selfish benefit of a few. They hold themselves aloof from matters of an industrial character. They realize that their training, their very life work has necessarily kept them out of contact with industry and its needs. In ignorance they are willing to view research from the same light it was viewed by our grandfathers. They are willing to profit by our material advances but are unwilling that our universities should do their share in these advances. To whom do we owe the developments in our steam and electric transportations To whom do we owe the electric light, modern sanitary equipment, the automobile and the many other numerous things which make life easier and pleasanter? Would we replace our modern Pullman or automobile with the leather strung coach? Would we return to our oaken bucket in preference to our modern bath room fixtures? Do we prefer candles to the electric lights? It is true that college men have had their share in these developments but—and here is the distinction—not as grandnates or as alumni doing their work in close contact with the university, but when, in large measure, if not completely, divorced from the university. It is true that Michigan has done her share in this very indirect manner. To Charles F. Bush, an alumnus of the University of Michigan, we owe much in our electric lighting; but who associates Michigan with the development of lighting? To Howard E. Coffin, a Michigan graduate, and others, many of whom are Michigan graduates, we owe the modern automobile; but who associates the university with the development of the automobile?

Personally I have no quarrel with those who believe the university should stick closely to abstract research. Personally I believe we should encourage in every possible way work of that type, for through it we widen our knowledge, we add to our culture and in the field of natural science we work toward laws which are at the foundation of science. I trust that as the Department of Engineering Research develops it will have funds available for work of this type. May the day come when all of the members of the various faculties have at their disposal funds to carry on such research work as they desire and in such magnitude as the work warrants.

The mistake which has been made in past, however, is that undue reticence has been displayed by those in authority at our institutions to encourage industrial and engineering research. This reticence is possibly a relic of the opposition which engineering education has encountered since the days of its first inception. It was only after overcoming much opposition that Rensaalaer Polytechnic Institute was established in 1837. It was felt for a long time by many of the leading educators of that period that the training at the school was too practical and not in keeping with tradition of higher education. Yet today we have no educators of moment who would make such a charge against our modern engineering schools and colleges.

Have not many of us as educators gone only half way? In taking a leading part in engineering education but not in engineering research have we not fulfilled only half of our mission? Should we neglect engineering research merely because it comes close to the material concerns of mankind which have great possibilities for adding to our efficiency and comfort? In an attempt to meet the old time classical viewpoint on research have we not neglected the modern engineering viewpoint?

The neglect is readily explained. It came about because of the very rapid increase in attendance in our engineering schools and colleges so that the various members of our faculties had little time or strength to devote to problems other than those of teaching. At Michigan the attendance in the Engineering College has doubled in the last ten years.

It arose because the money available was consumed in the procurement of buildings and apparatus for instructional purposes because of the rapid increase in attendance rather than in the procurement of apparatus for research purposes. Do you realize, for instance, that Dean Cooley has available for the college year 1920-1921 for new equipment the vast sum of $20,000? Do you realize that this sum must be distributed among the departments of civil, mechanical, electrical, chemical, marine and aeronautical engineering, and architectre? Do you realize that in chemical engineering we attempt to be conversant in inorganic technology including work in salts and work involving evaporation in all of its various ramifications, in organic technology including iron and steel, copper, brass and bronze, and in fuels including gas manufacture and coking practice? Do you realize that in these various fields we have available for new equipment for the year 1920-1921 a total of $1,925, a sum not sufficient even for the purchase of a moderate priced automobile? Do you who have been given opportunities to spend or authorize the expenditure of sums ranging from a few thousand to hundreds of thousands of dollars for the purpose of solving a given problem, do you imagine much work of real value under such limitations can be produced? This statement involves no charge against our University authorities relative to the improper assignment of funds. The Engineering College is given its pro rata. It does imply one of two things. Either we have looked at matters at the University from an utterly inadequate angle or else those of you who are in the industries have spent money on research work like drunken sailors

This very limitation of funds has very seriously hampered the mission of many of our teachers. They uncomplainingly attack problems with equipment that seriously handicaps rapidity of solution. Those who are in the industries would no more think of undertaking tests with the limited equipment and facilities we possess than you would think of turning Lake Erie salt by pumping into the lake the brine from our salt wells. Yet

THE 1921 MODE IN BOILER ROOM CONSTRUCTION

This photograph shows the steel work of a boiler room which the Reo Motor Car Company, Lansing, is building. You will notice one of the boilers pitched high up in the framework. This is a new 800 horsepower boiler and the plan is a starter on an arrangement which will be carried throughout the boiler room eventually. A new type of stoker is a part of the equipment. War quality fuel brought this form of boiler erection to the fore. The coal is carried to the boiler by mechanical stokers. There is plenty of room beneath to handle clinkers and ashes. The framework shown will be enclosed with brick.

Digitized by Google

our teachers carry on as best they can their work under most extraordinary handicaps. Is it any wonder that results are only slowly obtained? Yet our universities are our most consistent and continuous producers of research. Is it not a shame, though, that our men work under such handicaps?

The Handwriting on the Wall

Beyond question the magnitude of research at plants has far outstripped that at our schools. Where we spend a thousand dollars you spend a hundred thousand. Where we have a factory facility of equipment, chemist, draughtsman, engineer, clerk and stenographer we are compelled to do all things ourselves. Where we have to take down and replace apparatus because of lack of space, you build, if necessary, a special laboratory. Yet there is this handwriting on the wall: "Either there must be provided proper facilities for research at our universities or else the grade of men necessary for the proper conduct of your laboratories will not be forthcoming." It is believed that this handwriting has been seen, especially is this true in our own state, and that there will shortly break a day when with respect to research the University and the Industries will be closely allied.

Yet the University is not totally to blame for the present lack of co-operation. There has been and still is in some lines of manufacturing a belief that secret research will develop products of great value.

Co-operative research, co-operative with respect to industries of an allied type and co-operative with respect to close contact with institutions of learning, is the development of the day. Co-operation in this manner means a free interchange of information. It means freeing industries from the fetters of belief in Elysian powers of patents and in the value of secret processes. There are boards who have most powerful agents to prevent rational co-operation. Business achievement is more a matter of business administration and economics than patents. Can one of our automobile companies lay its success to patents? Are any of our furniture factories, our stove plants, our iron and steel and brass and copper plants dependent for their success upon patents? To one company that attributes its prosperity to patents there are hundreds that cannot make such a claim. Why, therefore, refuse to co-operate with one another and with the University merely because it may entail a surrender of patent possibilities and control on matters of publicity? Would not the saving resulting from joint co-operation offset in practically every case the benefits obtained through secrecy?

Even though matters of industrial success depended upon secrecy, carrying as it would patent privileges and deferred duplication, is it expedient, proper or wise that a state institution should be a party to such a course? Can the University lay itself open to possible charges of serving public interests? It would be quite proper to issue patents in the name of the public so that the unscrupulous would be prevented from collecting blackmail or deriving improper benefit from something that might have been worked out for the benefit of the public.

Before proceeding to a statement of the proposed work of the Department of Engineering of the University of Michigan, let us pause and see if we can picture to ourselves the industrial situation in the state.

In 1899 Michigan was the ninth state in the Union with reference to the value of its manufactured products. In 1904 it had crept to eighth place and in 1914 it occupied the seventh place. The census figures for 1919 are not yet out, but it is safe to say that it has not stepped backward and in all probability it is now in the fifth or sixth place; surpassed only by New York, Pennsylvania, Illinois and Ohio. Detroit has had a still more remarkable growth, rising from sixteenth place among the cities of the land in 1899 to fourth place in 1919.

Unfortunately there are no detailed figures available for conditions since 1914. An industrial census takes place every five years, the last one being in 1919, but the figures for this have not as yet been made public. Conditions for 1914 are given merely to enable one to draw a mental picture of the kind of industries in Michigan, not with any idea of giving a picture of the numerical scope of these industries. In 1914 there were six industries in which Michigan took first rank—automobiles, drugs and preparations, refrigerators, wooden goods not elsewhere specified, showcases and airplanes. There were seven industries in which she took second rank—furniture, stoves, salt, wood distillation and mail plaster. There were nine in which she stood third, seven in which she stood fourth and ten in which she stood fifth.

Based on the value of the product, the automobile industry for 1914 has been credited with $298,289,022. This had grown by 1919 to an estimated yearly value of $1,393,000,000. Detroit's quota of this amount is believed to be about 63 per cent. Foundry and machine shop products, lumber and timber products and furniture with a value in 1914 of something over $30,000,000 individually will doubtless show a collective value for 1919 of more than $350,000,000. Then there were four other industries, namely flour mill and grist mill, leather, tanned, carried and finished, paper and wood pulp, and slaughtering and meat packing, that produced goods individually to a value of more than $20,000,000 in 1914. In the same way there were eleven industries with a value to their products in 1914 in excess of $10,000,000 individually. These were lumber and planing mill products not included in planing mills connected with sawmills, brass, bronze and copper products, food preparations not elsewhere specified, malt liquors, chemicals, butter, steam, gas and water engines, printing and publishing newspapers and periodicals, tobacco, cigars and cigarettes, druggists' preparations and illuminating and heating gas. Then there were eleven industries in 1914 with a value to their product of more than $5,000,000 each; twenty-seven with a value of more than $2,000,000; twenty-one with a value of over $1,000,000; eighteen with a value of over $500,000, and twenty-four with a value in excess of $250,000.

The total value of Michigan's manufactured products in 1914 is given as $1,086,000,000. The estimated value for 1920 is probably close to $3,000,000,000.

Co-operative University Research

During the World War some of us who were in a supervisory capacity in the Inspection Division of the Ordnance Department estimated two and one-half per cent of the value of the finished product as the cost of inspection. Should we accept this percentage figure for this work and add to it one of similar amount for research we would have a sum total, based on a $3,000,000,000 valuation of the manufactured product for 1920 of $150,000,000, of which $75,000,000 would be for inspection and $75,000,000 for research. Are these figures too high? If you think so go back to your plant and learn the real facts regarding your inspection costs—include not only the labor of inspectors, but the expense on work which before final assembly proved to be defective, lost materials, lost supplies such as fuel and lost use of equipment.

Seventy-five million dollars looks like a big sum for research, but let us realize we are taking a statewide view of the situation. There are companies that have not hesitated to spend $500,000 a year on research. It would take only 150 such companies to make $75,000,000 and when we realize that the number of good sized industrial concerns in this state runs up into the thousands this sum when distributed shrinks into insignificance.

With this picture before us it is not hard to realize what should be the position of the Department of Engineering Research in its relation to the industries. It should become the research center for the industries.

Each main group of industries should bend together all problems that are common to all should be worked out in a common center. The University places its facilities at your disposal. To be sure they will be far from adequate when industries fully awaken to what has been placed at their disposal; but there is ground and beyond that increased facilities imply nothing but buildings and equipment. If these must be procured, it is much cheaper to procure them jointly than separately.

But do you say we have no problems? That statement I expect from sections which are dying of dry rot, but not from a state which

(*Continued on Page 36*)

Drafting a Standard Form of Contract

By ELWOOD SAMPSON

Chairman Public Relations Committee, National Association of Purchasing Agents

THE subject of contracts is one of the biggest issues in business today. Numerous articles published in almost every trade paper complain about the "contractual breakdown." Although no two writers or business men exactly agree on just what is wrong, it is still evident that something must be seriously wrong to cause so widespread a complaint.

When any situation is very serious, emergency measures will not effect a permanent cure. To bring about a real reform requires time and care. Even more so, it requires a calm getting together in a proper spirit of both sides affected by the situation.

Also, existing conditions can scarcely be corrected by any measure which can now be carried out. The damage has already been done, however, we can profit from the lessons of the last six years and endeavor to prevent as much as possible such conditions from occurring in the future.

Almost without exception the numerous remedies suggested put all the burden of the corrective work on the other fellow. Further, they are so generally altruistic and impractical that they are instantly rejected by everyone.

The one thing needed is a definite, concrete workable plan. Acting upon this premise, the National Association of Purchasing Agents is proceeding to carry out the following program:

The general plan or purpose is to draw up a standard form of buying and selling contract for use throughout both the United States and Canada. If such a contract form be drawn up protecting the equitable interests of both buyer and seller, then this is something concrete to start with.

The next step will be for the various trade, manufacturing and professional associations to make a concerted effort to get this contract form everywhere accepted and established. This would finally result in the crystallization of business opinion toward living up to contractual obligations.

The Real Battle Is Yet to Come

Eastern Interests to Carry Fight on St. Lawrence Waterway to Congress or the Courts if Need Be

INTERNATIONAL JOINT COMMISSION IN SESSION IN DETROIT

Left to right—Marcus Smith, new member of the Commission; Charles A. McGrath, chairman, Canadian section; Obadiah Gardner, former United States Senator from Maine, chairman, American section; Henry A. Powell, K. C. and Clarence D. Clark, former United States Senator from Wyoming. Sir William H. Hearst, former premier of Ontario and member of the Commission from Canada, was not present when this picture was taken.

By F. W. HERSEY

ALTHOUGH the case for the Great Lakes-St. Lawrence deep waterway to the sea, as presented by the ablest exponents of commercial, industrial, agricultural and transportation economics in fifteen or more states of the Middle West, and a great part of Canada, has been completed and submitted to the International Joint Commission of the United States for codification and deliberation, the battle for this great project is not won.

Because of Michigan's remoteness from the center of Eastern opposition, which is New York state, and the masterly manner in which Michigan's evidence has been compiled and presented, those in the Wolverine state most deeply interested will be inclined to consider the matter settled and the waterway as good as established. Instead, the hardest road is ahead. The first step in the proceedings has been statistical and argumentative; the second step will be judicial and the third legislative. When the fourth, or engineering and constructive stage has been entered, then slippers and the easy chair will be in order.

Into the judicial hopper has been poured a fairly amazing mass of information, which, when compiled in orderly manner, will constitute a history of past achievements, a clear picture of present struggles for future accomplishment and a prophecy of future development, which, in the light of all that has gone before, scarcely can be called the figment of imagination nor the vaporings of speculative enthusiasm.

Wherever this high commission has gone to listen, the feeling has been that it is a body most friendly to the project; a group of men who have sat in the high councils of their countries and whose years and experience assure analytical and judicial ability. The engineers' report on the feasibility, cost and engineering details of the proposed waterway development will be presented to the Commission within the next 30 days, after which the Commission will begin a systematic study of the evidence before it and prepare its recommendations. The time set for this work is 90 days; so that at the expiration of approximately four months all data and recommendations will be placed before the Congress of the United States and the Canadian Parliament. In the meantime the Great Lakes-St. Lawrence Deep Waterways Association, which has been working energetically for the project as the representative of all the states interested, will carry on a campaign of education throughout the country so that the public opinion which Congress will desire to know before committing itself will be intelligently voiced.

It is not believed that Eastern opposition will make itself really felt until the report of the engineers and the recommendations of the Commission have reached Congress. That there will be active opposition from New York state is evident from the statements already circulated. The Eastern section of the United States is intensely jealous of Middle Western advancement where such progress indicates competition the precise measure of which cannot easily be visualized, and therefore must be feared. It is evident that the opposition intends to reserve its real campaign against the project until it has reached Congress, where the political Big Berthas will be trained upon the legislators. There is the possibility also of recourse to the courts, a hint of which was voiced at the Detroit hearing.

This final hearing, by the way, was a fitting climax to the months of research, survey and symposiums in the major cities of the United States and Canada where the proposed route is favored or opposed. Detroit was accorded the honor of having the final hearing, a distinct tribute to the work of Michigan, Detroit and the Detroit Board of Commerce.

In the three sessions Wednesday and Thursday of last week much of the evidence previously submitted from this territory was rounded out and supplemented and a great number of additional facts added. It was open to all those from the United States or Canada who wished to be heard, and both countries produced able witnesses. It offered New York opposition a splendid chance to put in its case after having been in a position to review all the facts submitted in the long series of hearings. The fact that New York did not show to advantage may have surprised some of those attending the hearing, but it did not surprise the Association officials.

Former State Senator Henry W. Hill, of Buffalo, N. Y., was present on Wednesday, but apparently his main purpose in being there was to delay proceedings as much as possible. His first words to the Commission constituted a request that he be given an opportunity to be heard after the Commission had received the engineers' report. He asked that the Commission hold a hearing either in Washington or Ottawa after this report was in, so that New York could talk again at length. It was a neat attempt to obtain a semi-private hearing for the opposition, but it did not meet with the Commission's approval.

Mr. Hill's argument was that much of the evidence submitted in this final hearing was new to him and his clients. Although he was accorded full privilege to place before the Commission the arguments of the opposition, he pleaded inability to do so because he had little opportunity to study the evidence so far submitted. He declared that he was working without pay and therefore had other business to attend to which could not be ignored, which unfortunate situation prevented his preparation of a case for the opponents. His request for permission to file a brief with the Commission after the transcript of the proceedings of this final hearing was made, was granted, with the provision that the brief be filed within eleven days. Mr. Hill explained that he would have to ask the Commission for the courtesy of providing him with a copy of the proceed-

Digitized by Google

ings. The Commission agreed, although the question arose as to why New York had not kept a record of all the hearings if it was so vitally interested.

Obadiah Gardner, chairman of the American section of the Commission, replying to Mr. Hill's request for another hearing, said there would be no time for another hearing after the engineers' reports were in.

"It seems to me," said the chairman, "that you have been given ample time to present your facts at any of the numerous hearings."

Chairman McGrath, of the Canadian section of the Commission, recalled to Mr. Hill's attention that a hearing had been held in New York for the purpose of receiving all information possible on this subject.

"If New York were in Canada, I should feel free to express my opinion of its attitude toward that hearing," Commissioner McGrath said.

Commissioner Clarke, of the American section, asked Mr. Hill if any of the statements made in the present hearing were incorrect. Mr. Hill said there were, but that he could not challenge them effectively until he had prepared his case.

Several times H. C. Gardner, president of the Great Lakes-St. Lawrence Deep Waterways Association, who presided at the hearing, accorded Mr. Hill the privilege of speaking for an hour, or longer if necessary, but Mr. Hill declined to say a word until near the close of the hearing, at which time he spent about half an hour in more or less rambling statements and sugar-coated pleasantries.

He challenged as highly speculative all the statements bearing on the probable tonnage and traffic, the industrial and agricultural developments and power facilities expected from the opening of the St. Lawrence route, and made the charge that the whole project was fostered by the hydro-electric interests, whose only interest was in power production. He did not believe the tonnage of the route, when opened, would reach 3,000,000, but whatever it was, the New York Barge Canal and the railroads could easily handle it. Past rail conditions, he pointed out, were due entirely to the war and were not likely to occur again unless there was another war.

Referring to power development resulting from the improvement, Mr. Hill said that these, too, were largely speculative. He questioned whether power interests could get control of land for power stations and equipment. The Secretary of War might rule that the river was to be used for navigation only, but his judgment would be questioned in court, "just as your judgment on this project can be," Mr. Hill said.

"Assuming that the power rights are granted," the speaker added, "I doubt if more than 900,000 horsepower can be developed for the United States, while Canada might be entitled to 3,000,000 horsepower."

Mr. Hill bore strongly on the costs of the project, offering the argument that there were many other waterway projects only half developed which were more important and for which Government funds should be used, and declared that "the waterway and harbor facilities as are now in use will largely solve the transportation problems." He regretted a movement that would contemplate spending more than a billion dollars on a project that could not be considered more than "speculative and visionary."

Advocates of the waterway project who spoke at this final hearing were H. C. Barlow, traffic commissioner of the Chicago Association of Commerce; Hugh L. Hughes, director of the Bureau of Markets, Department of Agriculture of Minnesota; Rep. O. J. Larson, Duluth; Frank Niles, collector of internal revenue, Detroit; C. Carter, M. P., secretary-treasurer of the Canadian Water Power Association, Toronto; L. G. Macomber, traffic commissioner, Toledo Chamber of Commerce; C. E. Latshaw, secretary of the Farmers & Grain Dealers' Association of Ohio; C. L. Lewis, former president of the West Toledo Chamber of Commerce; B. R. Inman, Indiana State Chamber of Commerce; Rep. W. W. Chalmers; John A. Russell, editor of the Michigan Manufacturer & Financial Record, and president of the Detroit Board of Commerce, and William H. Adams, inland waterways committee, Detroit Board of Commerce.

All those speakers who followed Mr. Hill commented upon his remarks with considerable vehemence. Mr. Niles described the statements of the opposition as "vacuous and destructive." Mr. Russell pointed out that it was vision that built the great railroads of this country, and in these days no one questions but rather admires the vision of the great railroad builders. Subsequent developments have proved their "speculation" on the probable growth of this country to have been well founded.

Mr. Hill's statement that the railroads were quite competent to handle the future traffic received a jolt from Mr. Barlow, who called attention to the fact that although there had been seven increases in revenue and a four-fold increase in tonnage in the last 50 years, the railroads were closer to bankruptcy today than ever before in their history, and further increases in rates were out of the question. In freight rates, he said, Chicago was today 1,160 miles farther from New York than it was in 1916. Mentioning only one commodity, Mr. Barlow declared that the proposed waterway, if in operation today, would have 16½ cents on every 100 pounds of sugar transported westward. He estimated the operating expenses of the railroads as 80 cents on every dollar. "There is only one relief in sight," he said, "and that is to bring the Atlantic Ocean to the Great Lakes."

Mr. Hughes said he had made a survey of farming conditions in the Middle West recently and found that there had been no increase in crop acreage in the last fifteen years. While the population was constantly increasing, he said, farm development was at a standstill. Such increases in crops as were reported were due entirely to intensive cultivation and number of farms. Lack of cash and excessive cost of transportation were the causes, Mr.

Mr. Earle Defends Building Material Producers

HORATIO S. EARLE, Michigan's "Sunny Jim" of good roads fame, seldom allows the complacent course of his busy life to be the least ruffled by the various controversies which stir the political and economic life of the state, but the oft-repeated charges that the producers of building materials are responsible for the high cost of those materials and the consequent cessation of building activities have driven him into the role of private investigator.

As president of the Genesee Gravel Company, Mr. Earle has written the following letter and sent copies to Harvey B. Wallace, vice-president of the Detroit Board of Commerce; John A. Brown, director of the Board; Frank P. Rogers, State Highway Commissioner; the Interstate Commerce Commission; Michigan Public Utilities Commission; Flint Board of Commerce and Frank H. Alfred, president of the Pere Marquette.

"The public believes that the producers are to blame for the high cost of building material.

"They are told so by the press.

"We deny the charge.

"The prices of sand and gravel aboard cars at the plants in Michigan are 12 per cent higher today than in 1913.

"The first zone freight rate in 1913 was 37 cents per ton; today it is 84 cents, a raise of 127 per cent.

"The producers as well as the railroads have to purchase coal, machinery and labor.

"Why is it that the producers have to be the goat?

"Kindly answer this letter and give us the privilege of publishing both, and greatly oblige."

The Interstate Commerce Commission gracefully ducked the responsibility of expressing an opinion. Secretary G. B. McGinty, replying for the Commission, said it was not a subject coming within the jurisdiction of this body, therefore no opinion could be expressed as to the causes of the high prices of building materials.

Commissioner Esri R. Stewart, replying for the Michigan Public Utilities Commission, wrote:

"It is a well known fact to producers and commissions that freight rates have been very largely increased since 1913, and of course it is axiomatic that an increase in freight rates will increase the cost of a product to the consumer. The Commission is of the opinion that a very large proportion of the ultimate cost of sand and gravel is labor and freight."

Mr. Earle's letter to the Detroit Board of Commerce was placed before the board of directors, none of the members of which were able to contribute any information on the subject, but it was voted to turn the correspondence over to the Detroiter, official organ of the Board, in the hope that publication of the text would bring out discussions of the building materials situation.

In his letter to the Board of Commerce, Mr. Earle said that if the railroads would restore the freight rates of 1913, he believed the sand and gravel companies would immediately restore the 1913 prices on their product.

On March 26 Mr. Earle again wrote to the Board of Commerce announcing that his company had put into force the 1913 prices and the only difference in prices now existing, so far as his company was concerned, was chargeable to the 127 per cent increase in freight rates. The prices he quotes were as follows:

Washed sand, 60 cents a ton; washed 0-40, 75 cents a ton; washed pebbles, 90 cents a ton; bank 60-40, not screened, 80 cents a yard; bank 60-40, screened, 85 cents a yard.

State Highway Commissioner Rogers replied to Mr. Earle's letter as follows:

"This department is doing what it can with the Michigan Public Utilities Commission to cause a reduction in freight rates which we think are exorbitant. I do not think it seemly for this department to enter into a controversy between the railroads and the gravel producers concerning prices."

The Flint Board of Commerce sidestepped. Mr. Earle's letter was turned over to the publicity manager, who wrote that the "Flint Chamber of Commerce was not in a position at the present time to make any statement for publication regarding the prices of sand and gravel."

President Alfred, of the Pere Marquette, came back with an interesting discussion of railroad conditions as they affected his company. He wrote as follows:

"I assume from your letter (although you

How Detroit Is Putting On Men

Steady Improvement in Both Employees and Hours Since First of Year Shown in Official Figures

By MARC BRAUN

THE employment situation is steadily improving in Detroit. Proof is to be found in the accompanying two tables which have been compiled from the weekly labor records of the 79 concerns which are members of the Employers Association. These records show that the week ended March 29 was by far the best thus far this year, for the reason that a great many more men employed were put back on a full time schedule, while the number of workers employed on part time was the lowest since the week of January 18.

In referring to the general labor situation in the city one of the officials of the Employers Association said: "The mere fact that more men are being taken back weekly by the factories is naturally indicative of improved conditions of business, or at least of a necessity to increase production. However, because 8,500 men are added in this manner to the plants one week, as compared with 4,500 for the previous week, is not as a matter of fact so important and so much of an indication of improved conditions as the fact that 12,000 men were put on full time during the week although only 6,000 new men were added to the payrolls. The thing that means most is in reality the number of men putting in full time."

In general the public has not looked at the re-employment situation in the right light. The average man merely takes notice that so many workers are added from week to week. Few have analyzed carefully the weekly changes from the standpoint of the hours or time put in—in other words, have taken into consideration the fact that a large number of men were working only part time, while a comparatively small number was employed on a full time basis.

The accompanying charts will give the reader a clear idea of what has happened since the first week of January in the 79 plants. It will be seen that for the week ended January 4 there were 30,919 employes, while on perhaps best shown. The figures for eight weeks show an increase as to the number of full time workers and in the case of four weeks there is a decrease. The same is shown with the part time record, there being an increase recorded for eight weeks and a decrease in four weeks. The chart also shows quite a fluctuation in the average hours of work put in weekly by the part time workers.

The table showing the number of workers in the member plants of the Association, classified according to groups of trades or industries, gives striking evidence of the fact that the automobile manufacturing industry employs practically three-quarters of the entire industrial population of the city, for the caption "Vehicle and Transportation" on the table means the motor car makers. It will be seen that of 58,700 workers employed at the end of January, 33,555 were working in the automobile or truck establishments. At the end of February the number was 53,205 out of a total of 79,111, and at the end of March, out of 104,788 workers employed in 79 plants, 81,093 were in the motor car factories.

While the Employers Association does not disclose the conditions as they exist with each of its members, nor the names of the firms, the statement is made that the figures include the Ford Motor Company.

In referring to the employment figures for the week of March 29, General Manager, Chester M. Culver, said: "The firms who are reporting to us employ, when operating normally, two-thirds of the industrial working population of Detroit. They have working now 88,572 men, and that would seem to indicate that the present total employed in the factories of the city is 132,858, or 57 per cent less than were employed on March 20, 1920.

"As a further indication of the situation now, it may be mentioned that at the height of the employment situation in 1920, 201,542 were employed by the 79 concerns members

Total	58,700	79,111	†20,417	104,788	†25,661

*Decrease. †Net increase for the month.

March 29 these same establishments had 88,572 persons on their payrolls or an average increase of 4,435 for the thirteen weeks. Every one of these thirteen weeks shows an increase in employment except the week of February 15, which shows a decrease. When an analysis is made as to full time and part time employment, the unsettled conditions in industry are shown in the March 29 figures, which show that of the association, this record being attained in March. This was an abnormal record or high mark, and there seems no possible doubt that this figure will not be attained again for a long time. In fact it is known that a very large number of workers have left the city since last October, the estimates varying from 40,000 to 60,000, and it is not likely that all of these men will return to Detroit."

While it is not possible to make a correct estimate of what the high employment mark will be this year, it is estimated by some of the employment and work managers that 135,000 to 150,000 may be reached. Although more are of the opinion that the lower figure would be a very good showing for the year.

One feature in the employment situation is that the workers are putting in their best efforts to do things right. You hear this at the Ford plant; they tell you so at the Continental; it was so stated at the Paige-Detroit. At the Packard plant a man connected with the employment department said that some of the employes had been "transformed."

One of the officials at the Ford Motor Company said: "There is evidence in all departments that the men are working more conscientiously. They are more eager and willing to do their part so that there will be the least waste and the best returns. In some cases a shift of three or four or five is doing almost as much now as double the number did during the war."

"With fewer men in some departments," said an official of the Studebaker Corporation, "we are achieving not only as much as we did previously with a full force, but the work turned out is better.

"I believe the reason is the fact that the majority of workers know that there are thousands and thousands of men out of jobs and eager to get work and that there is somebody ready to take their place on short notice."

Yankee Ingenuity Tackles the World Banking Problem

Foreign Trade Financing Corporation the Result Of American Inventive Proclivity; What It Means

By PHIL S. HANNA

An address delivered by Mr. Hanna, Thursday of last week, before the Jackson, Mich., Chamber of Commerce Luncheon Club and five other luncheon clubs.

ONE of the grandest things about being a Yankee is that we do not wait for someone else to do the inventing. When a machine in one of your shops becomes obsolete by reason of changed conditions, or when unusual requirements are made of it, the Yankee impulse to find a machine to fit the new conditions immediately is aroused and we either consult other Yankees who make a business of inventing or we invent the new machine in our own shops. This isn't true in some countries. More often, when the machine becomes obsolete, progress stops. And this distinctive ingenuity of Americans is the very factor that has invented and created the machinery of the Foreign Trade Financing Corporation. It is nothing more or less than a new machine to do work that present machinery is inadequate for, and to perform a function that the creators of our present banking system did not foresee in the years of fat prosperity.

We are getting ready to enlarge the Welland Canal and deepen the St. Lawrence for the same reason, namely, that the old machinery is inadequate for the demands of progress. And about six years ago we created the Federal Reserve machinery, for a similar reason.

Some Comparisons

But now let us take a look at the existing banking machinery and see how far it goes in serving the demands of business. To employ a simile, we have several models for the various classes of banking—small cars in abundance for strictly home use, a number of medium carrying capacity for use at home as well as inter-city banking, and in the reserve cities we have a few two-ton trucks useful for all purposes; but all of these kinds of banks function on the short-haul theory. They are not provided with large enough gasoline tanks, so to speak, to undertake the long trips necessary in financing foreign trade, understanding that all of them have carried their normal load and more too during the last few years. Continuing the analogy, even the savings banks, which may be likened to trucks, are not suitable to the demands of foreign trade financing either. What we need (and I speak in terms of automobiles because it is the only tongue common to the whole United States today) is a new model built on the order of a five-ton truck but equipped to make trips of many hundred miles without stopping for gasoline.

This new model of banking machinery is necessary not only because the character of foreign trade financing is so absolutely different from that of commercial, or short time domestic financing, but because the war has injected a new problem for the sales manager.

Instead of shipping goods C. O. D. or on thirty, sixty or ninety-day drafts, the impoverished cash account of our foreign customer requires that we give terms anywhere from six months to six years, a job which few manufacturers and fewer commercial banks are in shape to undertake. The foreign buyer must have time enough to sell the goods he buys from us or to manufacture such goods so they can be turned into money. And the unfortunate part of it all is that we must go into this business or convert some of our surplus factories into cow sheds; for at the present rate of production of both manufactured goods and raw materials we are creating property worth on present prices of about $8,000,000,000 annually over and above what we consume at home.

I am not going at any length into the reasons why we must sell our surplus. Men like former Secretary Redfield and Charles M. Schwab, whose pronouncements I am sure have not escaped your attention, have covered this subject in the daily press. Just last week Mr. Schwab returned from Europe and made the following statement: "I studied conditions very carefully—and I have come to this conclusion with regard to America: the productive resources are somewhat in excess of home consumption. If we cannot export this surplus, we must at once limit the production of our factories. If we can export our surplus, as we should, we can then keep practically every factory in the country running at full time twelve months to the year." And we all know the testimony of many dependable observers to the effect that the war turned trade relations between the United States and the rest of the world upside down. Instead of owing Europe $6,500,000,000, Europe owes us to the extent of more than $15,000,000,000; but even if the debt were paid tomorrow, the big problem of finding work for our factories would not be materially changed. Payment of the debt would help us handsomely in taxes, but Congress would, no doubt, at its present rate of making appropriations, find a good excuse for using some of the billions for other purposes.

The Big Problem Is a Market

So that the big problem is to find a market for the $8,000,000,000 surplus in order to maintain the equilibrium in industry so often referred to by George E. Roberts, of the National City Bank, whose writings on this subject are so widely believed in.

The war disposed of this problem nicely for a time, but it went too far. The tremendous inflow of orders during the war urged many corporations to build plants in feverish haste to catch up with demand. And many did catch up, but they forgot that the rush would have to end some time. When it did, it would didn't result in a slowing-down that many expected at that time, we were still further lulled into a neurotic ecstacy of spending and flush times. I recall vividly the remarks of a bank president during a directors' meeting in April, 1920, when he said that business the world over was normal, the only difference between then and 1914 being that we were going to continue on a higher price level.

But what really was taking place from the Armistice up to the middle of 1920 was that we were filling orders on credit furnished by our own Federal Reserve Banks, and all the time it was the emergency stretch in our currency and credit system that we were doing business on. Europe was more nearly "broke" in November, 1918, than she is now, only we didn't know it. Our United States treasury kept on lending money to Europe which was nearly all spent here, and the Treasury raised those funds through certificates of indebtedness which were carried by the Federal Reserve Banks. But eventually Governor Harding became convinced that the system was too far stretched to be healthy and he put the lid on the money mess, with the well known result. In fact, the tendency toward overproduction was so manifest in 1913 that I believe this country would have come face to face with this problem sooner or later, even had there been no war.

Seriously, however, it is a burning shame, not alone from the humanitarian standpoint, to think of 100,000,000 people on this side of the ocean vested with the treasures of the earth, the fruits of the soil, the animals and their products, all in greater abundance than we have any possible use for, and the machinery, tools, factories, power and everything needed to convert our raw goods into commodities, having to sit idly by, passing up profits with a figure up in the billions, while other millions of people on the other side of the water who need these gifts of God and man-made goods so badly are obliged to go without, simply because financial machinery capable of achieving the exchange of our property for theirs has not been set up.

Can't Cash In On Surplus

And the worst of it is we can't cash in on our surplus. All we can do while Mr. McHugh is getting his long distance banking machinery built up and greased is sit by and watch that beautiful economic process of deflation do its deadly work to our inventory accounts and our profit and loss accounts. It is plainly up to us now. We must either find a way to sell our surplus and keep the factories running or the present scheme of living has got to be changed by sending the surplus employes who are out of work back to one-acre plots. And you can imagine how many men will embrace the small farm idea willingly. Even now the railroad unions are trying to make larger run uphill—they have foisted these national agreements on to the railroads with one object in view, namely to make jobs where none exist. And Townley, out in North Dakota—while he is just about licked—was doing similar stunts for the farmers, trying to make crops sell for more than they would bring.

Now just a word as to exports and imports. The business men of the country knew last fall that exports were falling off, although the government figures did not support the view at that time. Recently, however, Secretary Hoover has indicated that perhaps the earlier reports were in error and he assures us that the March figures will be correct. I mention this because the fact of shipments falling off and government figures going up led many people last fall to lay the blame for the business depression on something else. But, fortunately, the fact and the figures are now in agreement. Last Thursday the Government reported February exports $489,000,000, as compared with $635,000,000 for January. For the eight months ended with February, 1921, total exports were $5,127,000,000, as compared with $5,230,000,000 for eight months ended February, 1920. By countries the comparison is even more striking. Exports to Europe for February, 1921, were $241,000,000, as against $384,000,000 in February, 1920; to South America, $38,000,000, as against $40,000,000 a year ago

Motor Industry Starts Lower Taxation Drive

A definite campaign by the automobile industry to obtain reduction of federal taxes and a decrease in national expenditures is forecast by the activities of the National Automobile Dealers' Association and the National Automobile Chamber of Commerce, according to Harry G. Moock, general manager of the dealer association.

C. A. Vane, general counsel of the dealer association, went last week to Washington and New York to take up with the tax committee of the automobile chamber the definite proposals for revenue legislation principles which it is expected the industry will insist upon.

The two associations are very close on their ideas. Both have stuck to principles of taxation rather than methods and both are insisting that governmental extravagance, waste and so-called "war-time" expansion be eliminated. It is the theory of both organizations from their declarations that while a necessary measure of preparedness will cost money, there is no apparent reason for continuing expenditures for Army and Navy in peace times that were considered needed at the height of the German drive.

An interesting feature of the tax situation which was developed by the N. A. C. C. is that although the Government has cut from the estimates for 1922 (fiscal year) the item of $1,025,000,000 for federal control of the railroads, the total estimates for the year aggregate $4,653,856,759 for 1922, as against total appropriations of $4,673,396,276 for 1921. In other words, while the Government won't have to spend a billion dollars for the railroads, the other departments, mainly Army and Navy and civilian expense in Army and Navy Departments has crept up to absorb the extra billion dollars.

"The dealers throughout the country are not fully awake to the menace of the taxation program," says Moock, "but we expect to awaken them to its seriousness before the bill is enacted. We shall need the help of every association and individual before that is done."

A. I. B. PREPARES FOR CONVENTION

Preparations for the nineteenth annual convention of the American Institute of Banking are beginning to absorb the interest of bankers and bank employe members throughout the country. The convention is to be held in Minneapolis, July 19 to 22. President Stewart D. Beckley is spending several days in the four city going over arrangements. A feature of the convention that no doubt will attract many delegates is the special boat trip which leaves Duluth shortly after the convention ends. This will enable eastern delegates to return home by way of the Great Lakes.

FURNITURE SHOW DATES

Several important furniture expositions are announced. The first is being held, April 4 to 9, in Evansville, Ind. High Point, N. C., will have a show, June 20 to July 2. The Grand Rapids show will be held June 27 to July 22. About the same time there will be an exhibit in Chicago. The Jamestown exposition is scheduled for May.

MAKING BLOCKS AT ORION

Verne Green and Clarence Taylor have started a cement block manufacturing business in Orion.

BRIMMER CASHIER AT PETOSKEY

At the March meeting of the board of directors of the First State Bank of Petoskey H. L. Brimmer was elected cashier to succeed Chester D. Masters, who went to the First National Bank of Munising early in the year. Mr. Brimmer joined the First State about a year ago as teller, coming from Ludington, and was commercial teller until Masters left the bank, when he was made assistant cashier.

STRAIGHT LINE METHODS

Man and Method

Man is the human element in business—its soul and its brain.

Method is the orderly regulation of human effort. Without soul and brain all effort is mechanical. Until man found his soul and began to use his brain with definite purpose, business did not exist. Nor until the growth of business made an orderly regulation of effort necessary did method exist. Success, the attainment of a definite purpose, came with the introduction of method.

The development of method made business a science. And the science of business, like any other science, is simply the knowledge and understanding of facts and figures, coordinated, arranged, systemized for practical timely use.

To this end, and for this purpose, were conceived and developed the

New Centerless Grinder Ready

Detroit Machine Tool Company Brings Out Equipment With Several Important Features

THE Detroit Machine Tool Company, Detroit, a pioneer in the centerless grinding industry, and which has had a grinder on the market for the last four years, has been working on a new machine for the last year which it claims will place centerless grinding in a position heretofore unoccupied.

The new machine, which is to be called the No. 4 Heavy Duty Detroit Centerless Grinder, has several new and important features. Briefly, in this machine the work is actually and positively rotated by having it rest on top of the driving or rotating emery wheel. The work is also automatically fed and the machine is so designed that any feed or rate of traverse of work from the finest to 100-inch per minute can be had. The company calls particular attention to the fact that in this machine it is possible to rotate the work and have it travel at exactly the same speed and feed as any other cylindrical grinder of the

center type on the market today, so that former data is used to advantage.

In other words, a problem which is submitted to this machine, which has been handled on an ordinary type of cylindrical grinder, can be run exactly the same way, with the advantage that rows of work can be fed continuously through the machine and the grinding wheel will be working on its entire surface all of the time. Where only one piece is ground at a time on the center type of machine the wheel is often not working on its entire surface more than 40 per cent of the time.

In the full view of the machine as shown herewith, it will be seen that there are two emery wheels used. The upper one is the grinding wheel and is 18 inches in diameter, with a width of face of 4 inches, giving 225 square inches constant cutting or working area. The lower wheel is 9 inches in diameter and eight inches long. This wheel can be revolved at several rates of speed so as to give the peripherial velocities required for rotating the work. The wheel runs normally at 28, 38 or 52 revolutions per minute. In addition to revolving work, it also feeds it endwise. This is accomplished by swinging the two wheel column around so that the lines of force on top of the wheel feeds the work through the machine. The work is supported by the driving wheel and is guided between two blades which are accessible for adjustability through hand wheel and screw. In this case the work is a piston pin 1¼ inches in diameter, 4 inches long. The guide blades are of hardened and ground steel and are similar in appearance to those used on the old machine.

In one instance a feed angle of four degrees was used, which resulted in feeding six feet of work per minute, and since four cuts were taken, a net result of 1½ feet of pins per minute or 90 feet per hour of finished work, or 180 completely finished pins, were made. Recently on test, small ¾-inch diameter by ⅞-inch long cold rolled steel pins were ground with a view of sizing them or "clearing them up," and since ony one cut was necessary an hour's run disclosed the fact that 5,140 pieces were ground. A few pieces were unusually small and were quickly located because they were not ground or polished in appearance.

This strengthens the claim made that it is impossible for the work to receive scratches or "flats" which are received from the grinding wheel when it is possible for the work to lean against the grinding wheel. "Flats" are also received from the grinding wheel during moments of non-rotation and here again the claim is made that the work always rotates. Weight of work in the old machine often caused trouble, but here the pressure on the work from the grinding wheel as well as the weight of the work on the driving wheel all aid to keep the work "geared" to the driving wheel. In taking heavy roughing cuts with a free cutting wheel the wheel pressure has often been found to be around seven pounds and this pressure between the work and the driving wheel is more than sufficient to keep the work from slipping.

The capacity of the machine is from ¼-inch diameter to 3-inch diameter and from ½-inch length to 16 inches. Rods of brass and tubing have been ground up to three feet long. Outboard bearing supports were used to hold the work in alignment. Short work up to 4 inches long is fed to the machine by aligning the pieces in the angle iron trough supported by a stand.

The lower wheel is located centrally under the upper wheel. Since the lower wheel is 8 inches wide, it has 2 inches extra width on each side of the grinding wheel. This extra width is to insure the work rotating before it reaches the grinding wheel, and the same thing is done after the work has been ground. This is done not alone to make sure that the work is not rotating while it is near the grinding wheel, but it also brings the work to the grinding wheel and carries it away as well.

The work leaves the grinding wheel and falls into a pan. This pan leads it through an opening in the frame of machine and after it gets into the opening, the inclined floor inside returns, the work to the operator's side of the machine. When ft is remembered that 500 feet of work per hour can be fed through the machine, the factor on handling the work becomes a problem and this feature will be one of convenience to the operator as well as a time saver to the owner of the machine.

Trueing the wheel is done by putting in place the wheel trueing unit. The tube with slot permits the diamond to be pre-alined so as to be able to dress either wheel. A quick forward and backward motion will true the entire face of the wheel in a few minutes.

A safety feature is installed in the cyl-

A SIMPLE SET-UP

This Buick-6 cylinder block is handled with standard equipment. The cross sliding head makes it possible to grind the six holes without resetting the block.

Mr. Garage Owner:
Here Is Your Opportunity!

Repair shops everywhere are being approached by automobile, truck and tractor owners to look after their engines in such a way as to make them last longer.

Prepare to meet this demand by installing a

Madison Cylinder Grinder

for regrinding the cylinders.

It will add to your reputation, satisfy your customers and add new ones to your list, *all at a profit to you.*

The time required for regrinding cylinders averages less than one hour per hole. The usual charge is $24.00 per 6-cylinder block with 3½" to 4" bore, which can be done in 6 hours or less. Figure it out for yourself.

Eight-Hour Bill Beaten; Other Legislative News

By H. BOND BLISS

[*Staff Correspondent, Michigan Manufacturer and Financial Record*]

LANSING, April 4—Bills of importance to the manufacturing, financial and other business interests of the state were passed upon by the Legislature last week. Some of these measures were approved; others were defeated or amended.

The reciprocal insurance bill of Rep. Pat O'Brien was overwhelmed in the House by an adverse vote of 71 to 8. The purpose of the measure was to regulate reciprocal insurance companies, place them within the purview of the state insurance department and require a permanent deposit of $25,000 with the state treasurer.

The Holland eight-hour bill was also defeated in the House by a big margin, receiving only eight favorable votes. This bill provides for an eight-hour day for working men in all quarries, factories and manufacturing establishments, with time and a half for overtime and penalties for employers violating its provisions. Rep. Strauch of Shiawassee, who led the fight against the bill, offered an amendment to include farm labor. Several other amendments were proposed, which met with defeat, and then the entire bill was killed.

The loan shark bill of Rep. Liddy, Detroit, was passed by the House, but not until it had been amended by Rep. Frick, Detroit, reducing the legal interest rate allowed from 3½ per cent a month to 1½ per cent on small loans. The bill, approved by the Russell Sage Foundation, provides regulations of the small loan business. The present rate of interest on such loans is 3 per cent, with occasional additional charges. The bill eliminates any other charge except that of interest. Rep. Liddy declared that the reduction in rates would drive the loan sharks out of business as they could not afford to transact their affairs with this small return.

A concentrated attack upon the bill of Senator James Henry, Battle Creek, proposing a tax of $3 on driveway cars, was made by the automotive interests of the state. It was declared that such a tax would impose a hardship on the manufacturers at a time when they could ill afford it. W. S. Galbraith, manager of the Detroit Automobile club, said an average of 51,000 cars were driven out of the state on their own power annually and each driver usually left at least $20 in the state. It was pointed out that the Michigan automobile manufacturer already pays his full share of taxes for road maintenance and other purposes, and should not be taxed further. It was also emphasized that this tax would injure the interior towns which cannot ship by water. L. B. Roberts, counsel for General Motors, asked Senator Henry if he would be willing to levy a tax of a few cents on each carton of breakfast food shipped out of Battle Creek. George C. Conn, traffic director of the Buick Motor Company, Flint, and other representatives of the motor interests spoke against the bill.

Several important amendments may be made to the utilities bill of Senator Don C. Osborn, Kalamazoo, by the railroad committee, which has the measure in charge, to meet the objections of representatives of municipalities. One of the amendments provides that nothing in the bill shall be construed to prohibit a municipality from entering into an agreement with a public utility, fixing rates and terms and conditions or extensions of service on the basis of service at cost or any other basis, provided that if the utility is operating in more than one municipality the rates agreed upon shall not be discriminatory against the consumers in any other place, and if so shall be subject to regulation by the public utilities commission. Another amendment would give the Commission the power to appoint or remove, and in any city or group of cities to investigate complaints and be a local inspector, the expense to be borne by the utilities. Another change would include jitney buses under the jurisdiction of the Commission. Another amendment would exclude Highland Park from jurisdiction of the Commission along with Detroit, because it is a city within the boundaries of Detroit.

The Michigan Public Utilities Commission would be reduced from five to three members and the salaries from $7,000 to $5,000 by a bill introduced in the House by Rep. Miles. The measure would also prohibit any interference of the Commission with home rule franchises and any kind of jurisdiction over publicly owned utilities.

The McNaughton fence bill providing certain requirements for fence manufactured in Michigan probably will die in the committee of agriculture of the House as a result of the opinion of Attorney General Merlin Wiley in which he stated he believed the bill to be unconstitutional, as it interferred with federal statutes on interstate commerce. Michigan manufacturers opposed the bill, claiming

A Rotary Vacuum Pump, Chuck

Crescent Company, Detroit, Develops Equipment Which Shows Well in Tests

ALTHOUGH vacuum has for years been put to many useful purposes, its application to various industrial operations is steadily increasing and engineers are constantly experimenting with it in an effort to find new uses for it. The Crescent Pump Company, Detroit, has developed a new type of rotary vacuum pump, which, it is claimed, has many improvements over other types now in use. The company also has perfected a vacuum chuck for holding magnetic and non-magnetic materials for work on grinders, shapers, planers, millers, lathes and bench work of all kinds. Both the pump and the chuck are the results of experiments conducted by William A. Hatcher, an automotive engineer now connected with the Crescent Pump Company.

The pump weighs only 1-19 as much as other pumps of the same capacity and general character, while its cost is estimated at only one-third. It is valveless, cools itself like a flywheel while revolving, has no clearances, requires

The New Crescent Rotary Vacuum Pump

no sealing or cooling liquids, has a positive displacement and is guaranteed to pull within one-half inch or less of the barometer. It is constructed on a new principle which eliminates wear by revolving all working parts in the same direction at the same angular velocity.

This type of motion requires that all parts be in perfect dynamic or running balance. All moving parts are supported on bearings, and are circular, one within the other. The wear does not take place upon the bearings, for there is an automatic compensation between the parts which takes up the wear. This compensation prevents slippage and leakage. This pump seals itself by the nature of its construction and likewise cools itself. The stuffing box is of original design and does not require taking up. Ball and roller bearings are used. Both compressing elements revolve in the same direction and at the same velocity, the resultant motion being rolling. The vane is not a flying or sweeping vane, but revolves with the casing. There are no valves in this pump. Each revolution opens and closes ports.

The inlet port is a slot on the periphery of the roto-piston. The exhaust port is a slot on the periphery on the revolving case. Port opening occurs as the roto-piston rolls around to the proper position on the inner periphery of the case. Self-cooling is obtained by the fact that the working chamber itself is revolving at high speed with the case and is constructed to radiate heat of compression through its walls to the outer atmosphere. The roto-piston as positively displaces the space within the working chamber as does the piston of a reciprocating machine—more so, in fact, for there are no clearances or valve losses. Thus the pump gives high volumetric delivery efficiencies. The volume delivered can be as accurately known when speed is known as if measured by a gauge. Low friction loss and high efficiency at compression and delivery produce low power consumption.

The pumps are equipped with automatic lubricators. Oil cups could not be used because the vacuum created inside the pump would immediately empty them and flood the pump with oil. A 170-pound pump direct or belt-driven will deliver 15 pounds steady pressure or pull a vacuum to one-half inch of the barometer, 3,000 cubic feet of air an hour for a maximum of 5 horse power. Special types will exhaust to 1-10 of an inch of vacuum or better.

At the Llacois motor plant several of these pumps with the necessary chucks were put to work grinding bronze washers after other grinding methods had resulted in losses of from 50 to 75 per cent of the work produced. It seemed impossible properly to hold the work in place until suction pull was adopted. It is reported on reliable authority that the loss has been cut to less than one per cent. Vacuum lifters are used at the Dodge Brothers factory for the operations on brake drums and also for pulling steel sheets under machines. The Production Tool Company has used this vacuum chuck for grinding stellite and high speed tool steel.

Introduced in one Detroit cleaning establishment for drying, the vacuum pump has increased the production capacity per girl 280 per cent for twelve girls on ironing work. Another use is the drying of pepsin and ptyalin in chemical laboratories. There are being conducted in Detroit at present intensive experiments in the manufacture of paper bottles, and vacuum is used to pick up and hold the paper while being rolled. The B. F. Goodrich Company uses thousands of glass bottles of a peculiar type in certain operations. Vacuum has been used in filling these bottles with a great saving in breakage. For grinding glass the vacuum chuck has proved of great value in eliminating the necessity of making plaster of paris beds. An 8-inch vacuum cup, for instance, has a 703-pound pull, while a 24-inch cup has 6,333 pounds lifting power. The roto-piston pump for 3,200 cubic feet per hour weighs 185 pounds complete.

The vacuum chuck developed by the company is similar in shape and use to the magnetic chuck, but has the additional advantages of being able to hold brass, bronze, fiber, glass, stellite, die cast metals, wood, rubber, etc., as well as holding iron, and machine and tool steel. Materials can be held without bending or warping. Angle plates and special shapes can be held to the chuck surface, and materials held to the angle plates as well as the chuck surface. The work can be held so that the strains in the material are removed while machining. The chucks, it is claimed, do not mar,

Digitized by Google

strain, warp or magnetize the work. Truly parallel faces can be obtained with one setting instead of two or three. Work can be machined to close limits. There is nothing to get out of order in a vacuum chuck and the faces do not need constant grinding to keep them true, thecompany asserts. The vacuum tends to draw off the heat from the work while being machined. The holding power of high vacuum, by which is meant vacuum to within one-half inch of atmospheric pressure, is equal to the holding power of magnetism and more evenly distributed.

Cadillac Moves Offices to Its New Detroit Plant

The general offices of the Cadillac Motor Car Company have been moved from 6331 Cass avenue, Detroit, to the new eight-building manufacturing plant at 2860 Clark avenue. This new factory replaces the present plant, which consists of 77 old type structures scattered about Detroit, and is declared by engineers to be one of the most modern automobile manufacturing plants in the world. It provides 48 acres of working space, and the various buildings which are now four stories high, can be raised to six stories. Materials used are concrete, steel and brick.

Largest of all the units is the manufacturing building, 800 feet long and 600 feet wide. It is so arranged that raw materials can be brought into one end of the building and completed chassis run out under their own power from the other end. This building has a floor space of 970,000 square feet.

The heat treating building is 500 feet long and 80 feet wide, and the assembly building, 800 feet long and 360 feet wide, the floor space being 626,000 square feet. A warehouse with a capacity of 1,000 cars has been provided for storage.

The executive offices will be located in the administration building, a structure 225 feet long and 50 feet wide. The exterior is of Bedford limestone.

The plant service department will be located in the assembly building.

LYONS' ANNUAL FAIR

The annual spring sample fair of Lyons, France, March 1 to 15, was, according to a press report, as usual a very successful and important event. Foreign representation was strong, but the number of exhibitors from the United States was not what had been expected. An advance list received a few days ago shows only six American firms listed, compared with 115 from England; thirty each from Italy and Switzerland; twenty-two from Czecho-Slovakia; seventeen from Belgium; ten each from Holland, Sweden, Norway and Denmark; five from Argentina, and two each from Spain and Finland. There were, all told, about 2,300 exhibitors, most of them being, naturally, French firms. A further idea of the size and importance of this fair may be had from the following list showing the number of different concerns, firms or agents according to groups of trade: Food products, 125; shoes, 121; metal industry, 59; watches and jewelry, 104; automobiles, 88; ceramics or earthenwares, 131; furniture, 76; wool fabrics, 66; knit goods, 79; men's clothing, 80; leather wares, 96; cotton fabrics, 120; silks, 86; hides, 77. Many American products were shown by French firms or by the agents in France.

SECOND PACKARD DRIVERS' CLASS

The Packard Motor Car Company, Detroit branch, opened its second 1921 class for truck drivers Wednesday evening of this week. The course, which is open to all drivers, will extend over eleven weeks. Fifty drivers graduated in the first class this year. R. D. Andrew is in charge.

HARDENING

We are equipped to take care of the treating of steel and make a specialty of automotive parts. We also can carbonize or temper tool, jig and fixture parts. Our truck enables us to give you 24-hour service.

GRINDING

Special screw machine equipment enables us to specialize in the manufacture of the following parts, all of which can be ground by the centerless method. We can grind to any accuracy required.

Piston Pins
Valve Roller Pins
Roller Clutch Pins
Dowell Pins (Hardened Straight)
Oil Pump Plungers
Roller Bearing Rolls (Straight)
Differential Gear Pins
Headless Shackle Bolts
Universal Joint Pins

500 CARS SOLD AT DETROIT SHOW

There were 88,130 paid admissions to the 1921 Detroit automobile show—12,022 more than in 1920. This is a new record and is considered by the show management as a splendid one, the daily average attendance being better than 10,000.

Sales aggregated more than 500 cars, it is announced. As for the number of prospects recorded by dealers, the total runs into the thousands.

NEW UNITED MOTORS FACTORY

The United Motors Company, Grand Rapids, one of the oldest exclusive truck manufacturers, has completed arrangements to open its new factory for the assembly and distribution of United trucks on the west coast and in Mexico. The factory in Grand Rapids will continue as before and manufacture and handle the sales for the entire territory east of the Rocky Mountains. The manufacture of parts will be continued at the Grand Rapids factory and shipped in carload lots to the western branch to be assembled. Enlargements to the present factory will be made here as fast as necessary. Mr. Kanary will continue as president of the United Motors and will also act as general manager of the new western factory. H. R. Green, present treasurer and sales manager of the company, has been appointed general manager of the Grand Rapids factory.

LEE TIRE SALES

For the first two months of 1921 the Lee Tire & Rubber Company reports sales of approximately $1,500,000, which is about equal to the total for the corresponding period a year ago. These were made at reductions in prices of from 15 to 20 per cent.

ADVANCE-RUMELY'S TRUCK PLANS

Pending final decision as to which engine is to be selected as standard equipment, the activities at the new motor truck department of the Advance-Rumely Company, Battle Creek, will consist in building truck bodies and otherwise making the chassis ready to take on the engine, says a report from Battle Creek. The truck branch of the company was formerly in Clearing, Ill., and has been brought to Michigan to replace the threshing department. Besides the truck, the Battle Creek Advance-Rumely division will build the company's tractor, known as the Oil-Pull.

E. J. SAMUELS MOVES UP

Several years ago E. J. Samuels was a reporter on one of the Akron, O., newspapers. Then he joined the Goodyear Tire & Rubber Company and soon graduated from one job to another until he became manager of the organization division. Now the company has promoted him again to be manager of inside sales, with headquarters in New York. At one time he was connected with the Chicago branch.

WILLYS MERGER FORECAST

Banking interests identified with the Willys-Overland Company and the Willys Corporation are considering the feasibility of a consolidation of the two organizations to facilitate adjustment of the financial difficulties of both of them, says the New York Herald.

The Willys-Overland Company and the Willys Corporation are separate organizations, although the principal executive personnel of both of them is the same and their affairs are otherwise closely interwoven. The Willys-Overland, with the main plant in Toledo and branch factories in Elmira and Indianapolis, produces Overland and Willys-Knight automobiles. The Willys Corporation represents a consolidation of Electric Auto-Lite Corporation, the New Process Gear Corporation and the Duesenberg Motors Corporation.

For the last six months Willys-Overland operations have been so reduced that profits have been practically nil. Its chief concern, however, lies in bank loans of approximately $20,000,000. Banks holding the notes have almost unanimously granted extensions, and if they continue to do so it is expected that the company will be able to improve its position this spring, when increased operations should reduce inventory and bring in cash. The situation in the Willys Corporation is less favorable. It has current assets of about $26,000,000 and banks are creditors to the extent of about $11,000,000. The Elizabeth plant is between 80 and 90 per cent completed, and additional funds are required to finish it.

The committees formed several weeks ago to protect the stockholders have the problem under consideration.

BADGER JOINS STEEL PRODUCTS

The motor spring department of the Detroit Steel Products Company announces the appointment of F. E. Badger as special representative in both sales and engineering. Mr. Badger has had eleven years' experience in spring building with both the Western Spring & Axle Company and the Standard Parts Company.

PACKARD SALES MEN CONFER

Sixty distributors, dealers and factory branch managers of the Packard Motor Car Company held a three-day convention last week at the plant. H. M. Datwick, technical manager at the factory, presided and there was a detailed discussion of field problems. The sales representatives reported business increasing.

AMERICAN BOSCH MAGNETO

The American Bosch Magneto Corporation is reported to have approximately $10,000,000 of unfilled orders on its books and to be improving its financial condition steadily. In addition to the reduction in wages the dividend has been reduced by half and other economies effected.

FRANKLIN ABOUT SOLD OUT

The H. H. Franklin Manufacturing Company, Syracuse, N. Y., maker of the Franklin car, has announced that its output for March and April is practically all sold and that the outlook for spring and summer business is unusually encouraging.

STUDEBAKER'S POSITION

One of the principal reasons why Studebaker Corporation stock has been steadily going up is said in financial quarters to be not only the fact that it is known that the corporation is doing a fine business, but that at the beginning of the year less than 3,000 unsold Studebaker cars were held by the corporation. That was very much less than was generally believed.

BEGGS MANAGES PLANET SALES

The Planet Manufacturing Corporation, Detroit, maker of a carburetor attachment, announces the appointment of Edwin S. Beggs, who comes from Long Beach, Calif., as sales manager.

C. A. EARL HEADS BRISCOE

Clarence A. Earl has been elected president of the Briscoe Motor Corporation, Jackson, succeeding Henry F. Wardell, who has been named vice-president and a director. Mr. Earl is especially well known in the automotive industry for his connection with the Willys-Overland Company, Toledo, which he joined in 1915 as a vice-president. Later he was made first vice-president and general manager of all the Overland plants. Before entering the automobile field Mr. Earl was connected with a number of other important concerns in other lines, such as the Corbin Screw Company, American Hardware Corporation and Hendee Manufacturing Company, the latter making the Indian motorcycles.

W. J. Jacoby, also a former Willys-Overland official, has become sales manager of Briscoe.

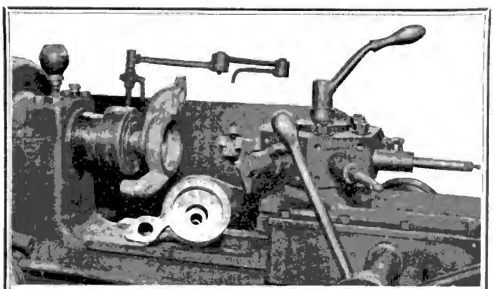
WILCOX NOW MANAGES COMMERCE

The Commerce Motor Car Company, Detroit, announces the promotion of George D. Wilcox, director of sales and advertising, to the position of general manager of the company. Mr. Wilcox has held the position of sales manager for Commerce for seven years. Under his direction the policies of sales, advertising and service have been formulated, resulting in a nationwide organization distributing Commerce trucks as well as invading in a large way the export field. Orville D. Coppock, who has been Mr. Wilcox's assistant, becomes sales manager. There will be no change in policy.

MEARS-RICHARDSON-BRIGGS

The Mears-Richardson-Briggs Company is a new advertising firm which has been organized in Cleveland by three men well known in their profession, Charles W. Mears is one of the oldest advertising men in the automobile field in point of service, with the Winton Company, Cleveland, almost from the time Winton automobiles were first made. William E. Richardson comes from the Chicago offices of Lord & Thomas. He was vice-president of Lord & Thomas, with whom he has been connected for the last 15 years. Ralph E. Briggs has been engaged in advertising work for the last 20 years in New York and Chicago. The new company has taken quarters in the Cleveland Film Exchange building, Payne avenue and Twenty-first street.

OFFICIAL FORD FIGURES



The Ford Motor Company shipped 62,362 cars during March. Retail sales for that month totaled 87,221 cars, it is officially stated. The production for April calls for 90,000 machines and there are now more than 100,000 orders to be filled. There are now very nearly 40,000 men on the payroll, these being distributed among the different plants in and about Detroit—that is to say, Highland Park automobile plant and the tractor and body plants in the River Rouge district. Of this number of employes only about 2,000 are not working full time; all the others are back on a normal schedule. General outlook for automobile and tractor sales, so far as Ford products are concerned, is said to be good and the company feels confident that from now on production as well as sales will increase steadily.

HAYES' METAL TRUCK CAB

The Hayes Manufacturing Company, Detroit, has brought out an all-metal truck cab. It is equipped with sliding windows and doors and a ventilating windshield to make it an all-weather cab. Due to its all-steel construction, it affords the driver a wider range of vision than does a wooden cab. The parts are interchangeable.

B. F. JONES QUITS REPUBLIC

The Republic Rubber Company, Youngstown, Ohio, announces the resignation of B. F. Jones as president.

The hub of this Cast Iron Water-Circulating Pump-Body has been turned and drilled on another No. 4 Turret Lathe. The tools on this No. 4 rough bore and true up for shaft, ream to size, counter-bore for clearance and finish bore and face large diameter—all in 5½ minutes. Most of these tools are standard.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Muskegon—Announcement has been made by the Grand Trunk Railway that Muskegon will have a car ferry service crossing Lake Michigan, the city thus becoming a terminal point for freight from many western cities destined for eastern points. It is said that the Grand Trunk plans a dock which will house four boats loaded with cars. There is some speculation also as to whether the Muskegon Railway & Navigation Company will complete its work in putting in ferry docks to carry freight from the city to other towns along the western shore of Lake Michigan.

Hamilton, Ohio—Henry Ford, accompanied by several Ford officials, visited the company's tractor plant in Hamilton, a few days ago, and expressed confidence that the tractor business was on the mend. While the party was in Kingman, O., on an inspection tour of the Detroit, Toledo & Ironton Railroad, it is said Mr. Ford told a D. T. & I. executive that he had in mind extending the road to Hamilton to reach the tractor factory.

Grand Haven—The Goodrich Transit Company's boats have started the season on a tri-weekly schedule. Boats leave Grand Haven on Monday, Wednesday and Friday nights and leave Chicago on Tuesday, Thursday and Saturday, while the boat train will leave Grand Rapids at 7:40 in the evening.

Washington—In the complaint of the Buick Motor Company vs. the Grand Trunk Western Railway Company et al., the Interstate Commerce Commission has decided that the rates charged on automobile tire carriers, in carloads, from Detroit to Flint, during federal control of the railroads, were applicable and not unreasonable. The complaint has been dismissed. The case, which was No. 11366 on the commission's docket, was submitted December 13, 1920, and decided March 1, 1921. The decision has just been published.

Detroit—The passenger traffic season on the Detroit-Cleveland run opened this week when the steamer Eastern States left its dock at Detroit, bound for the Ohio metropolis.

Lansing—John T. Ross, traffic commissioner of the Lansing Chamber of Commerce, will join in no effort to induce the railroads to reduce rates until they are able to cut the wage scale and other present costs, he declares.

Detroit—The Grand Trunk Railway shops at Port Huron and the Pere Marquette shops at Saginaw resumed operations Monday morning, the former with 375 men and the latter with 200. Grand Trunk officials said that future activity would depend on the amount of railroad travel.

1920 American Truck Sales In South America Analyzed

From 1913 to the end of December, 1920, there were exported to 26 Spanish and Portuguese speaking countries a total of 17,417 American-made trucks, according to statistics just compiled by El Automovil Americano, New York. The total does not include Ford trucks sold in Spain and Portugal, the publication adds, since the establishment of an assembling plant by the Ford Motor Company at Cadiz, Spain, in 1914, and assembling plants at Buenos Aires, Argentina, and Sao Paulo, Brazil.

How the American vehicles were distributed is itemized as follows: Cuba, 3,981; Mexico, 2,908; Philippines, 2,053; Brazil, 1,341; Peru, 1,215; Spain, 833; Argentina, 806; Chile, 759; Porto Rico, 575; Portugal, 528; Columbia, 326; Dominican Republic, 312; Venezuela, 301; Panama, 274; Uruguay, 211; Ecuador, 59; Bolivia, 59; Salvador, 52.

"Our export of trucks to Peru, South America, in 1920, increased 334 per cent over 1919," says El Automovil Americano. "Peru is in the best position of all South American countries. Here mining and industrial interests, coupled with the lack of railroads, make it an attractive field. Shipments to Peru more than double the number of trucks in 1920 that she purchased in 1919. Portugal's increase for the same year was 420 per cent. Mexico has been a large buyer of American trucks because of her oil fields and mines. During 1919 and 1920, when oil production increased 40 per cent and 120 per cent, respectively, over 1918, Mexico bought more than three times as many trucks as during the previous six years.

"Brazil has used American trucks principally in and around Rio de Janiero and San Paulo. In Argentina, light dellvery trucks have been used in Buenos Aires. On large farms, or estancieros, American trucks have been used to advantage for several years. For light trucks with pneumatic tires, this field holds potential possibilities. Cuba has absorbed the largest number of American motor trucks. This fact is due to the prosperity brought on by the expansion of its sugar industry and the necessity of increased transportation to handle the increased production of sugar. Cuba is the largest producer of sugar in the world, production increasing 50 per cent during the war period and reaching 4,000,000 tons in 1919 and 1920. American trucks have been used for the most part in the cities of the Spanish and Portuguese speaking countries. The lighter capacity trucks—up to 2½ tons—have been the best sellers, due to lack of improved highways and the lower investment cost."

SCOVELL TO ADDRESS B. OF C.

Tuesday noon, April 12, Clinton H. Scovell, Boston, will address the Detroit Board of Commerce on "Essentials of Efficient Management." Under this heading Mr. Scoveli will discuss production planning, cost accounting, labor turnover, employment methods, profit sharing and some related subjects, not to undertake a detailed exposition of any one of these matters but rather to indicate their relative importance in a well proportioned plan of management. The section will be devoted in part to Mr. Scovell's address and in part to an open forum, during which there will be an opportunity to ask Mr. Scovell questions based on his address and on related subjects.

Mr. Scovell's experience has been acquired as senior partner of the firm of Scovell, Wellington & Company, accountants and engineers, with offices in New York city; Springfield, Mass.; Cleveland, Chicago and Boston.

In the evening Mr. Scovell will address the April meeting of the Detroit Chapter of the Society of Industrial Engineers at a dinner at the Board of Commerce, on the subject, "Cost Analysis as a Device for Executive Control."

DETROIT SERVICE STATION OPENED

The American Engineering Company, Philadelphia, maker of the Taylor stoker, has established a mid-western service station at 1772 West Lafayette boulevard, Detroit. A complete stock of parts for all sizes and types of Taylor stokers is carried and immediate shipments will be made.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Lansing—Work was started here this week on the construction of a 10-story business block at Michigan and Washington avenues, on the site of the old Prudden building, destroyed by fire during the winter. The building will be erected by the Prudden Building Company, which has obtained a 99-year lease of the site from William K. Prudden, the owner. The property is 48 by 132 feet and the building will have a total of more than 50,000 square feet of floor space. The Prudden Building Company has been incorporated for $375,000, with $225,000 common and $150,000 preferred. The Michigan Mortgage Investment Corporation will underwrite the preferred and no stock will be offered the public. The officers are: President, William Brogan; vice-president, William J. Dancer; secretary, Bert J. Baker; treasurer, William R. Town. These, with Glen R. Munshaw, comprise the board of directors. Samuel Butterworth is the architect.

Detroit—The Department of Public Works was this week considering the bids received for improvements in the Fairview sewage pumping station, the improvements to consist of an additional chimney, underfeed stokers and a modern system of coal handling. The plans and specifications were prepared by Smith, Hinchman & Grylls, architects and engineers. It is estimated that the expenditure involved will be around $90,000.

Lansing—The city council last week virtually awarded the contract for the construction of the Elm street bridge to W. Marshall & Son, Grand Rapids, who bid $53,000.

Detroit—Building permits taken out during the week ended March 30 totaled 342, as compared with 458 for the week of March 23 and 484 for the corresponding week in 1920. The outlay represented was $230,690, as compared with $1,514,545 for the previous week and $1,736,575 for the corresponding week in 1920.

Capac—Eastern capital has obtained control of the St. Clair Paper Company and will enlarge the plant, it is reported.

Lansing—Work on the construction of a store and office building to be erected by the Lansing Fifty Associates Company will be started before the middle of the month. Two stories will be built now but foundations will be placed for more stories.

Detroit—Contracts and sub-contracts let by architects during the week ended March 31 were mainly for residences, stores and schools, as the list from the Detroit Builders & Traders' Exchange shows. Among the projects in the hands of architects and reported to the exchange are a number of school propositions, among them an addition to the Estabrook school, Linwood and McGraw avenues; additions to Sampson school, Begole avenue and the completion of the Case Technical gas engine laboratory and welding plant.

Saginaw—In February 112 permits were taken out, as compared with 75 in February, 1920, and the cost involved was $106,083, while a year ago the amount was $72,985. The construction contemplated was mostly small jobs.

Kalamazoo—The week ended March 19 was the best thus far this year, 26 permits being taken out, cost of buildings being estimated at $20,100. Most of the grants were for residences or homes.

Grand Rapids—Activities during the week ended March 26 increased as far as number of permits issued was concerned, and decreased as to cost involved. The number taken out was 65, which was 13 more than the previous best record so far this year. The cost of the jobs planned was figured at $63,787, as against $114,715 for the previous week, which was the high mark this year. The list of permits is headed by one taken out by the Moon Lake Ice Company, for a manufacturing plant of brick construction, to cost $20,000.

E. Foster Moreton Heads State Cartage Association

[*By Staff Correspondent*]

GRAND RAPIDS, April 6—Sixty cartage men from all over Michigan and representing about 2,500 operators, assembled at Hotel Pantlind today and organized the Michigan Highway Transportation Association, and for the first time gave the commercial hauling industry of the state a unity for co-operation.

The morning session was devoted principally to a general discussion of basic conditions under which operators in various sections must do business. All pleaded for a state body that would stabilize conditions, reduce price cutting and make for a better understanding of the cartage industry on the part of the general public.

The convention was welcomed to Grand Rapids by Lee H. Bierce, secretary of the Grand Rapids Association of Commerce, and by J. Zevalkink, president of the Grand Rapids Cartage & Transfer Association. Mr. Bierce discussed legislation and urged the delegates to work for a constructive legislative program to be submitted to the 1923 lawmakers. He explained to the truckmen how freak legislation is born and made a plea for educational efforts.

In the afternoon, a constitution and by-laws were adopted and the convention adjourned, prepared to make a strenuous campaign for membership all over the state.

E. Foster Moreton, of Detroit, was elected state president. The other officers chosen are: First vice-president, E. M. Radcliffe, Grand Rapids; second vice-president, W. G. Stone, Hillsdale; treasurer, H. G. Bebbe, Battle Creek; secretary, H. H. Hardy, Lansing; directors, the above and Henry Stephens, Flint; F. H. Stevens, Saginaw; Edgar T. Raseman, Kalamazoo; E. A. Hopperstead, Muskegon; Charles J. Foster, Cadillac; C. L. Alden, Benton Harbor; Henry Wellman, Hastings; A. Alexander, Battle Creek; W. J. Lastrange, Mt. Pleasant, and L. J. Flanagan, Marquette.

Lansing will be state headquarters, with offices of the secretary in the building of the Fireproof Storage & Transfer Company. The delegates accepted invitations to attend the convention of the National Team & Motor Truck Owners Association in Detroit, in June.

The Michigan Manufacturer and Financial Record, by resolution, was made official organ of the state association.—FISCHER.

CANADIAN BRIDGE CO. APPROVED

A bill to incorporate the Canadian Transit Company to be capitalized at $5,000,000 and to build and operate a railway and traffic bridge over the Detroit River between Detroit and Windsor, has been passed by the house committee on railways, canals and telegraph lines of the Canadian Parliament at Ottawa. The company is empowered to borrow money, issue bonds and charge tolls subject to the approval of the Canadian Railway Commission. The construction of the bridge cannot be started until the United States Congress approves the plan.

Building Revival Reported By Three Michigan Cities

The building outlook in Grand Rapids is improving, due to the fact that contractors are buying lumber at practically the prices asked four years ago. That is the gist of a statement given the Grand Rapids Press by John McNabb, who is quoted as follows:

"The time honored oak is going out of fashion for interior finish owing to its scarcity. Gumwood, imported from the South, is taking its place, even in the highest priced homes. It can be treated to resemble any wood desired and for enameling it is wonderful. It costs about what oak did three years ago.

"We also are getting a full day's work for a full day's pay. That adds to the efficiency of the work and economy of construction. One of our greatest troubles in the last two years and a principal cause of the high cost which has discouraged the building of houses, has been that the men loafed on their jobs because there were more jobs than men. They thought that by that policy they could continue the demand for labor at any price, indefinitely. But when they know they must work to hold their jobs they do their best. We don't mind paying high wages when we get full recompense in work. With these conditions there is no better time than now to build."

A dispatch from Cadillac says that despite the high prices of building materials a large number of new houses are being put up in the city, in addition to much repairing and cleaning-up work.

In Allegan a movement has been started to remedy to the shortage of bonses. The city council has been urged to exempt newly constructed homes from taxation for a number of years.

AMERICAN BOY PROMOTES GRIERSON

Griffith Ogden Ellis, editor of the American Boy, and president-treasurer of the Sprague Publishing Company, Detroit, announces the appointment of Elmer P. Grierson as business manager of the magazine and secretary-assistant treasurer of the company. Mr. Grierson, a graduate of the University of Michigan, has been advertising manager of the American Boy for seven years.

GRAND TRUNK GETS ULTIMATUM

If the Grand Trunk Railway Company wishes to have its petition for further advances in rates and an extension of time in the arbitration proceedings to determine the value of the physical properties, it must turn its property over to the Canadian Government, according to an ultimatum issued by Arthur Meighan, prime minister, who said that the government railway system must be unified and placed upon a more economical working basis. It had previously been charged that the Grand Trunk system was too expensively conducted and administered.

FOREIGN TRADE CREDIT EXTENSION

In support of its contention that foreign trade credit extension facilities are badly needed the Foreign Trade Financing Corporation asserts that 2,000,000 tons of exportable foodstuffs and fuel are held in elevators, freight cars and warehouses waiting for arrangements for financing shipment. This amount of goods represents a single order from one foreign government.

ENGINEERING OFFICES MOVED

The offices of E. R. Little, engineers, have been moved from the Dime Savings Bank Building to 1918-1920 Ford Building, Detroit.

BROADWAY MARKET DIVIDENDS

A semi-annual dividend of 3 per cent on preferred stock, payable April 20 to stockholders of record, April 1, has been declared by the Broadway Market Company, Detroit.

DETROIT, SATURDAY, APRIL 9, 1921

The Program at Washington

IT IS REPORTED from the national capital on what appears to be reliable authority that the legislative program mapped out by President Harding and his advisers is as follows:

First, an emergency tariff to protect the agricultural interests; second, an anti-dumping law; third, an American valuation bill; fourth, a permanent tariff, and, fifth, taxation reform.

This is all meaty enough, but it seems to this paper that it could be improved upon. In our opinion there are three things more immediately pressing than the tariff, and these are: First, relief for the railroads; second, taxation reform; third, government retrenchment. They are, we believe, of importance in the order named. After these have been taken care of, Congress could very well turn its attention, first, to an anti-dumping law, and, second, to the enactment of a permanent tariff schedule. There is no real need for agricultural relief, and as for the commodity valuation bill, it may be sandwiched in among the others.

In these columns last week we endeavored to show something of the plight of the railroads and to explain why we believed it necessary that steps be taken immediately to improve their condition. We pointed out that industry could not possibly prosper under the handicap of a completely demoralized transportation system, and that we were going to have a completely demoralized transportation system by the middle of the year unless a radical operation were performed.

The point is that even under the present indefensible taxation system, and whatever tariff duties are laid under the Underwood law, business has begun to revive, and will continue to revive as the public loosens its purse strings further, and it will not be long until the railroads will be called upon to handle a volume of business much greater than that of the moment. With bare treasuries and inadequate and crippled rolling stock, how are they going to meet the demands? How are they going to care for what business we have? It seems to us that to provide the means of stimulating business first, leaving for future consideration the means of moving the products of revived industry from manufacturer to consumer, or to the seaboard, is putting the cart before the horse. The railroads should have first call.

After the railroads, taxation reform. And hand in hand with taxation reform must come government retrenchment. People of all shades of political opinion are practically unanimous in the conviction that the usefulness of the excess profits tax died with the war, and that the law should be repealed at the earliest possible moment. In view of all that has been written on this subject, it hardly seems necessary to restate at this time the arguments as to why such taxes be done away with. It may not be out of place, however, to recall to the mind of the reader that three reasons are paramount: First, that the handicap upon business enterprise and initiative laid by the tax must be removed; second, that the condition which is driving capital out of industry and into tax-free investments must be eliminated, and third, but of no less importance, that business be given prompt assurance as to what the taxation demands of the next year or eighteen months are going to be. Nothing is contributing more to the timidity of industrial leaders than the uncertainty as to what the government is going to require of them in the way of taxes. Knowledge in this regard is more important than an understanding of the principles that are to underlie our next tariff. By admission of Rep. Fordney, chairman of the House Ways and Means Committee, it will require eight or nine months to frame and pass a permanent tariff bill. Business cannot wait that long on a taxation program.

As to just what form of tax can be enacted to take the place of the excess profits levies the members of Congress are reported to be somewhat at sea. However, the business interests of the country seem to be pretty well agreed—and in this agreement they are supported by some of our most noted economists—that a tax on sales will warrant a try-out. There are objections to this program, chief among them that such a tax would be hard to collect, but, notwithstanding, the sales tax is worth trying. Certain it is that considerable relief could be afforded by spreading the liquidation of the war debt over a longer period, so as to lift some of the burden off the backs of this generation, upon whom the present system places responsibility not only of paying interest, but of the principal as well. It does not seem unreasonable to suggest that the next generation might pay its part. Although, perhaps indirectly, it has profited as much by the result of the war as have we.

Along with taxation reform must come the strictest kind of government economy. A few hundreds of millions of dollars of expense can be lopped off the annual budget, and every million saved is that much subtracted from the total of what the country has to pay. It has been estimated that there are a good many thousands of government employes scattered about the country filling jobs that were created where no need existed, and simply to provide jobs for the "deserving." These can be done away with without loss of government efficiency; indeed, with a promotion of efficiency. There are bureaus that can be abolished or combined with others, and there are many lines of endeavor that can be curtailed. The application of the principles that govern the management of private businesses would result in the saving of a staggering total annually.

A great many earnest men will argue that the tariff should come first. Mr. Fordney, writing in the Protectionist, explains our languishing industries, increasing unemployment and shrinking revenues as "the inevitable result of the inadequate tariff law now in force," declares that "the disparity between production costs here and abroad is greater than in the pre-war period," and warns that "to save our industries and the earning power of the American people, no time should be lost in replacing the present tariff law." That may be true, but we may be pardoned for expressing the opinion that Mr. Fordney has overestimated the importance of the tariff, at least for some months to come. Production costs, as he says, may be further apart, here and overseas, than they were before the war, but over against that may be weighed the fact that Europe is in no position now to compete with us aggressively, and will not be for some time to come. It is admitted that Germany is making more rapid strides toward rehabilitation than any of her neighbors, but how serious a factor in world commerce Germany may be after the Allies get through collecting the war debts remains to be seen. Our guess is that she will not cut so much of a figure as a good many people expect. Certainly, if all the reports coming from England are true—reports of disorganized industry and trade—we have nothing serious to fear from her. And France is pleading bankruptcy in such convincing fashion that the Harding administration seems disposed to believe her. There is much to support the proposition that America can hold her own in world markets and fear little from European imports on the basis of the present tariff, at least for the present.

Digitized by Google

If it be argued that we must have the tariff ahead of taxes as a means of raising revenue, let it be recalled that the tariff last year yielded only $825,000,000, as against $4,000,000,000 of the income tax. It is the opinion of able economists that the tariff for some time to come will yield only 8 to 10 per cent of the national revenues. It would be better to look first after the hen that lays the golden eggs.

The agricultural emergency tariff propaganda may be dismissed as purely political in character and deserving of corresponding consideration.

Britain at the Crossroads

WITH practically every mine in the islands tied up by a strike, with other trade unions debating whether to walk out in sympathy and with rioting so widespread and so violent as to necessitate a virtual rule by arms, Great Britain appears to have arrived at an industrial crossroads. Will the government declare for a permanent policy of subsidy to guarantee wages or will it abide by its recent decision to withdraw entirely from industry? Mr. Lloyd George asserts there will be no surrender—that the government cannot, in the present state of its finances, levy taxation to subsidize a great industry to satisfy its employes. Such a course, he declares, is "wrong in principle and completely indefensible," and now is as good a time as any to settle the question once and for all. The unions, on the other hand, are presenting what appears to be a united front. The business interests of the whole world look on with bated breath.

The situation came about substantially as follows: During the war the government found it necessary to guarantee the income of the British mining industry in order that the latter might pay the scale of wages demanded by the unions. The crisis will be remembered. Recently came the end of government subsidy and in connection therewith the announcement by the mine operators that they would have to reduce wages, support from the federal exchequer having been withdrawn. The miners struck. Today the fuel supply of the British Isles is cut off, industry, already at a low ebb, is demoralized, and the thousands of men out of work stand to be augmented by members of other unions, notably those engaged manning the railroads and the water transport systems. The government, declaring it will not retreat, repeats that it is prepared for a showdown.

The situation as embracing the miners alone is serious enough, but it becomes the more critical in view of the stand being taken by other unions. Havelock Wilson, president of the seamen's union, is reported as "opposing" a subsidy for the miners for the reason that, if it were granted, it would be necessary to extend government support to other industries. "If the miners are going to be subsidized," he asked in a speech in Liverpool, "why should not all other workers whose wages are being reduced?" It is to be suspected that he is not so anxious to beat the miners as to establish grounds for similar demands on the part of the seamen and the railroad men in case the miners win out. Earl Curzon, secretary for foreign affairs, seems to have sensed Mr. Wilson's meaning pretty clearly, for in an address in the House of Lords on Monday he declared the question had ceased to be one of wages and had become one of state policy, affecting every industry in the country.

Anyone who understands how largely British labor is unionized and how ever since the outbreak of the war it has dominated the government's course as regards industry, and how imbued with radical ideas it has become by reason of communion with the red element in Russia, will understand the gravity of the present crisis. Government subsidy of any industry to guarantee wages is nothing less of course than state socialism. The unions want a continuance of it because under it they wax comfortable while the men who pay the taxes foot the bill. So long as their income was guaranteed, the operators condoned the policy, but now that normal conditions are being restored, they realize what a Frankenstein they have helped to create. And so does the government.

Once more it is being demonstrated that the time tried principles of sound economics still prevail and that whoever tampers with them plays with fire.

This Is Real Co-operation

HERBERT HOOVER promises to put the Department of Commerce on the map, just as everybody expected he would. He started this week a series of conferences with the leaders of American business and industry looking to the development of our world trade. From the personnel of the first delegation, much is to be expected from this effort. His callers included A. C. Bedford, chairman of the board of directors of the Standard Oil Company of New Jersey; George Ed Smith, president of the Royal Typewriter Company and one of the moving spirits in the American Manufacturers' Export Association; John H. Fahey, Boston; Homer L. Ferguson, president of the Newport News Shipbuilding & Drydock Company and former president of the Chamber of Commerce of the United States, and Philip H. Gadsen, Philadelphia, president of the American Electric Railway Association. All these men were named by the U. S. Chamber of Commerce. Later on a committee from the American dye industry will confer with Mr. Hoover regarding steps to be taken to protect this youngest American industrial infant from German competition, and after that there will be meetings with some of the leaders in the automotive and other industries.

The new Secretary's program is truly significant in itself, but it is more important in that business generally has confidence in Hoover and is disposed to give him the greatest measure of support. It understands that he has sensed the correct function of the Department of Commerce, which is to bring into play all its facilities and to extend them for the assistance of commerce and trade, and that, moreover, he has the ability to do that thing in the largest way.

This is something new in American political life—at least within the last few years—and it is as gratifying as it is new.

Short Measure Stuff

THE BANDITS' lobby at Lansing has passed the word among the boys not to kill any more policemen until the legislature kills the capital punishment bill.

FINANCIAL

They Seek the Facts Now * * * Something to Think About in South America

By PHIL S. HANNA

THERE is a growing disposition on the part of everyone to get at the facts concerning the future of business. This evolution of mental attitude is one of the most encouraging signs of the times. Until recently one who dared paint the picture of the business outlook according to reason and known facts, rather than wishes and hopes, was commonly accorded a reception not unlike that given a leprosy suspect. He has been shunned, avoided and ridiculed. But time has proved the failacy of attributing all our business ills to psychological trade drawbacks.

Another popular theory is likewise about to go into discard, namely, the hypothesis that business is good or bad according to the amount of money available. In spite of the fact that the Federal Reserve Banks are now holding real reserves of $53.40 against every $100 of deposits and currency outstanding, business still lags behind the early 1920 pace. On December 33, 1920, when the reserve ratio was $45 of reserve to $100 of deposits and notes, the money theorists gave us much promise that business would revive if we only had more credit. But we now have more credit and business has not come in the same proportion that the banking situation has improved.

The most dependable theory advanced is that business has been poor because more goods have been produced than consumed. In any consideration of the business outlook it is necessary to weigh the part that foreign sales has played since 1913. We cannot overlook the fact that when a truck manufacturer in Detroit failed to ship three trucks a day to Buenos Aires during November and December, an equal amount of orders from some other source had to be substituted in order to maintain his steady stream of business. And when the Detroit truck maker cut down his production by three trucks a day he cut down his purchases and his payroll proportionately, with the result that the materials and men so released became available for other country factuers, who, finding themselves confronted with a similar loss of orders, not only had no use for the men and materials released from the truck maker, but added to the surplus materials and men by releasing some of their own. And all the way down the line there was a similar falling over of tin soldiers.

We often read government figures of exports and imports which are construed according to the theory of the writer, but granting the constructions so placed, when one sees actual photographs of thousands of crates of American automobiles, steel and other commodities piled up in the harbors of Cuba and Brazil, he cannot fail to conclude that the failure of former customers to pay for and continue to buy our goods is at once one of the most definite and conclusive reasons why business has slumped.

* * *

The Buenos Aires representative of the J. B. Ford Company has favored us with a copy of the Buenos Aires Herald of February 27, in which are photographs of huge piles of goods in vacant lots in Buenos Aires. One shows more than 3,700 American automobiles in crates which have been refused by purchasers; another shows piles of machinery and steel covering an area seemingly larger than an ordinary city block. The third shows hundreds of boxes containing general merchandise. The paper says: "The situation is due largely to refusal of consignees to accept shipments. These rejections commenced to be serious last October when news arrived of falling price values in United States. Dr. Varela, addressing the Chamber of Commerce, estimated the value of rejected American goods in the port at something between 40 and 45 million gold dollars, and local bankers say the amount is now above 50 million dollars and new merchandise continues to arrive by the shipload."

If the failure of abnormal foreign trade built up during the war is not the reason why business is poor in Detroit, the falling prices have at least by the above specific instance cheated American manufacturers out of about $50,000,000 of sales previously made, and stopped new business while the accumulation is being disposed of. When the price question is brought up you have hit the nail on the head.

Let's forget exchange rates for a moment and assume that all the countries of the world use gold dollars, and look at the position of the United States as a seller of goods in competition with France, Germany and England. It seems clear that insofar as our prices are higher than those for goods offered by other nations, we should lose trade—quality, usefulness and other considerations being approximately equal. "Very well," some will say, "let's forget foreign trade. It is a hoax anyway." Therefore suppose we go back to prewar days and sell to the world approximately what they come after and buy merely those things with which nature did not endow our land. We must then witness falling prices and idle factories for some years to come. Eggs were 16 cents in Reed City, Mich., this week, because more people are raising eggs up in that section and fewer are consuming them down in this section; and on top of that, the express charges are nearly as much as the eggs cost at Reed City.

But the outstanding fact is, whether we agree with the "over-productionists" or the "under-consumptionists," that foreign purchasers have kept our factories going longer than we realize it, and the immediate future of business is going to depend largely on whether we can achieve a resumption of foreign sales or not. For any surplus of goods over home consumption, even though the surplus be small, acts as a brake on business and holds production off until the surplus is consumed. Witness the closing of the copper mines despite the fact that $40,000,000 worth of the product was temporarily taken off the market. And while the brake is clamped on business, the purchasing power of employes falls, but if only a method may be found whereby our surplus may continue to be taken by the rest of the world without interruption, the loss of our surplus goods over there will make these peoples larger ultimate purchasers and in the meantime we shall avoid the waste due to unemployment. In many respects the machinery of American business is like that of a large automobile plant which relies on quantity production for its profits. Unless a certain production is maintained, there are no profits nor even expenses, but above that figure of output there is a progressive rate of profit. And as they say in the language of the trade, "we have got to keep production low to make money." So here is something to think about. The United States is committed to quantity production and the proposition before us now is either enough orders for that kind of industrial life or go back to custom-made methods.

* * *

A strange effect of the business depression which goes to show how similar industries have been differently affected is a comparison of reports of the S. S. Kresge Company and of Sears, Roebuck & Company. The Kresge company reports sales for March as $4,642,223.89, against $4,074,175.43 for March a year ago, a gain of $568,048, or 13.94 per cent. Sears, Roebuck & Company report sales for the first three months of 1921 as $49,706,969, a decrease of 41.64 per cent, compared with the first three months of 1920. Sales for March, 1921, were $20,105,904, a decrease of 26.83 per cent over March a year ago. The figures of course bear out the well known capacity of the farmer to get along without new things as against the habit of the city man of providing himself with clothes and other commodities from day to day. The gain of the city merchandiser no doubt reflects efforts on the part of the city dweller to save money by patronizing the so-called 5 and 10 cent stores.

* * *

The ease with which the Guaranty Company of New York sold $500,000 of Porto Rico 4½ per cent bonds, April 1, is a sign that there is considerable money for investment when the offerings appeal sufficiently. These bonds, so it is reported, were sold within a few hours. The bonds mature in 1941 and 1942 and were sold on a basis of 5¼ per cent.

New Export Problems

Mere order-taking in foreign trade has had its day. Though American shipments of foods, merchandise and materials over-seas continue large, exporters in every line recognize that the turn in the tide has come.

In future, goods that go abroad must first be sold. Customers must be sought, studied, served. Markets must be developed and connections formed on a basis of information and analysis even more exact than those required in securing business in the past.

In making contacts with unfamiliar markets—in keeping touch with changing conditions—in carrying out the financial or shipping operations required in over-seas transactions—the Irving's Foreign Service and Foreign Trade Divisions may be able to supply you with just the information, counsel or banking and commercial aid you need. For exporters—as well as importers—Irving spans all seas.

Who's Who In Michigan Finance

A. J. Haviland, Cashier, Traverse City State Bank

Honors came to Albert J. Haviland when the directors of the Traverse City State Bank, Traverse City, a few days ago elected him

A. J. HAVILAND

only is the election an honor to Haviland because of the well-merited promotion of which cashier to succeed August J. Maynard. Not it is evidence, but because he becomes thereby the cashier and managing head of the largest and one of the oldest banks in northwestern Michigan. The bank was founded in 1856 by Hannah, Lay & Company and was incorporated in 1892 as a state bank. Capital is $200,000 and on February 21 total deposits were $3,016,462.

Mr. Haviland is a native of Traverse City, having been born there in 1878. He went to the local schools, graduated from high school and went into the bank in 1897 as a messenger, in 1905 he was elected assistant cashier. An official of the bank writes: "He has filled every clerical position and for many years has been on the official staff, so that he knows the game from 'A to Z,' as well as being well versed upon all local conditions."

In addition to becoming cashier Mr. Haviland was also added to the board of directors.

$369,434, same as year before. Liabilities—Capital stock, $919,720, no change; accounts and notes payable, $9,193,390, as compared with $1,749,351; reserves, $3,253,452, as compared with $2,823,329; profit and loss, $3,716,300, as compared with $5,946,759; capital surplus, $1,147,287, no change.

BANK REPORTS FEBRUARY 21

Commissioner F. W. Merrick has issued Bulletin No. 60 containing abstract of reports of 550 state banks, two industrial banks and eleven trust companies doing business under Michigan banking laws, as of February 21, 1921.

Aggregate footings, compared with the report of December 28, 1920, decreased $16,650,407.04, but showed an increase of $13,085,785.72, as compared with the report of February 20, 1920. An idea of how both loans and deposits are following one another down the scale of deflation may be gained by the following tabulations:

Report Feb. 21, '21, compared with:	Report Feb. 24, '20	Report Dec. 28, '20
Loans and discounts, com'l, deps.	*$2,378,302	*$ 5,267,744
Bonds and mtgs., com'l, dept.	$ 19,249,062	* 2,764,393
Deposits, commercial dept.	$ 52,867,572	$ 4,196,920
Bonds & discts, savings dept.	* 1,900,404	$ 4,551,603
Bonds, mtgs., Sec., savings dept.	* 19,909,957	$ 4,458,142
Deposits, savings department	* 19,959,548	$ 13,422,396
Total loans and discounts	$ 14,128,844	$ 14,256,784
Total deposits	$ 21,075,327	$ 15,954,916
Capital stock	$ 12,317,675	* 3,427,425
Borrowed money	* 14,822,938	* 166,960

*Increase. †Decrease.

A condensed statement of all the institutions as of February 21, 1921, follows:

Loans and discounts	$ 509,106,534
Bonds, mortgages and securities	161,570,191
Reserves	113,092,421
Other assets	52,56?,?80
	$?,?08,?2?,?06
Capital, surplus, undivided, etc.	$ 118,540,408
Commercial deposits	317,?96,?2?
Savings deposits	?01,?2?,?79
Rediscounts	29,901,130
Bills payable	?7,?61,?54
Other liabilities	29,?86,6?6
	$1,?2?,?5?,6?6

Applications for charter for new banks approved February 4, to March 21, are as follows:

Nunica State Bank, Nunica; Kaleva State Bank, Kaleva; Cass City State Bank; American State Bank, Cadillac; Pinney State Bank, Cass City; Jeddo State Bank, Jeddo.

Increases in capital stock have been approved as follows:

Lansing State Savings Bank, from	$150,000 to	$200,000
Merchants Savings, Battle Creek, from	125,000 to	250,000
State Bank of Perry, from	15,000 to	25,000
Athens State Bank, from	30,000 to	40,000
Citizens Com'l & Sav., Flint, from	150,000 to	400,000
Farmers State, Breckenridge, from	25,000 to	50,000
Allegan State Savings, from	50,000 to	75,000

AN UNIQUE ADVERTISER

F. A. Roethlisberger, president of the First State Bank of Hillsdale, believes in writing his own copy. Excerpts from recent advertising carried on by his bank seem to be of sufficient carrying power to warrant reproduction, as follows:

"What is 'Conservatism' in Banking? It is a standard bank word, but what does it mean? U. S. Government securities illustrate that of itself a low interest rate does not prove conservatism or safety. For who can say that a government 2 per cent bond is more safe than one at a higher rate?"

"Conservatism in banking seems to us to consist in doing the right thing at the right time. For some time banks have received 1 per cent or 2 per cent more for their loans than formerly. We feel that we are conservative when we allow our depositors a part of this increase. We believe it is the right thing for us to pay 4 per cent on savings deposits and this is the right time to do it."

REDMONDS OPEN DETROIT OFFICE

George F. Redmond & Company, Boston brokers, have opened a Detroit office in the Congress building.

LOSS RESERVES and SURPLUS

These two items comprise the real strength of an insurance company.

Of the two, SURPLUS is the most important, for if the LOSS RESERVES of the company are only barely sufficient to comply with the law, it is still technically solvent and may continue business.

But LOSS RESERVES in compensation insurance are of necessity partially based on estimate. If they prove insufficient the solvency of the company thus depends on its SURPLUS.

Realizing the vital importance of an adequate SURPLUS for the complete security of its member policyholders, the Michigan Mutual has consistently maintained such a surplus.

On Dec. 31st, 1920, this amounted to MORE THAN A MILLION DOLLARS, providing a margin of security ample for every possible contingency.

Write for "The Motive of the Mutual," a booklet giving full information about the company. A postal will do.

Michigan Bond Items

Walton township, Olivet, has approved the proposition of bonding the village for $30,000 for building and equipping a public school building.

The voters of Shelby have decided, 138 to 18, in favor of bonding the town for $10,000 for highway purposes.

The city of Manistique has sold to Howe, Snow, Corrigan & Bertles, Grand Rapids, $97,000 of pumping station and water extension bonds, the offer being par with a premium of $2,968. Other offers were: Whittlesey, McLean & Company, Detroit, par and $1,940 premium; Keane, Higbie & Company, Detroit, agreed to find purchaser for bonds, par value, accrued interest and $950 commission; Watling, Lerchen & Company, and Bolzer, Mosser & Willaman, Detroit, agreed to find purchaser and offered par value, accrued interest and asked $1,675 commission.

Frank F. Rogers, state highway commissioner, will receive sealed bids at his office at Lansing up to 1:30 p. m., April 20, for the sale of road assessment district bonds following: Road Assessment District No. 364, in Isabella, Mecosta and Montcalm counties. Approximately $66,000 worth, maturing serially in from two to five years. Bonds are the obligation of Rolland township, Isabella county; Millbrook township, Mecosta county; Belvidere and Home townships, Montcalm county and the counties of Isabella, Mecosta and Montcalm and an assessment district. The bonds are being issued under the Covert Act. Interest will be payable semi-annually on May and November 1 in each year. Each bidder will be required to name the rate of interest (not exceeding 6%) and premium for each thousand dollars he will pay, in his bid. A certified check in the sum of 2 per cent of the amount of the bonds bid on, payable to the order of the State Highway Commissioner, will be required with each bid. The right is reserved to reject any or all bids.

To provide funds for reducing the company's bank loans and increasing its working capital, the Vacuum Oil Company, through a banking syndicate, headed by the National City Company, is marketing $20,000,000 of 15-year 7 per cent gold bonds, dated April 1, 1921, and redeemable on and after April 1, 1926.

The state highway commissioner will receive sealed bids at his office at Lansing, up to 1:30 p. m., April 20, on the sale of $120,000 of bonds of road assessment district No. 205 in St. Clair and Macomb counties. The bonds mature serially in from two to five years. They are the obligation of Wales, Columbus, Lenox and Berlin townships, St. Clair county; Armada and Richmond townships, Macomb county; the counties of St. Clair and Macomb and an assessment district. They are issued under the Covert Act, with interest payable semi-annually on May and November 1 each year. Each bidder will be required to name the rate of interest (not exceeding 6%) and premium for each thousand dollars, he will pay, in his bid. A certified check in the sum of 2 per cent of the amount of the bonds bid on, payable to the order of the state highway commissioner, will be required with each bid. The right is reserved to reject any or all bids.

Elston & Company are offering an issue of $600,000 of 8 per cent notes, dated March 1, 1921, due serially up to March 1, 1931, at par and accrued interest, of Barnhart Brothers & Spindler. This company manufactures and sells commodities necessary to the printing industry and according to the announcement has earned consistently since its establishment 53 years ago, the average for the last nine years being $227,136.

The Belgian government will retire, June 1, 1921, by operation of the sinking fund, $2,000,000 of the issue of 7½ per cent bonds, due in 1945 at 115 and accrued interest. Paine, Webber & Company are asking holders of these bonds to report the numbers on their bonds and they will advise whether such numbers are included in the list of bonds drawn for payment.

Halsey, Stuart & Company are offering a limited amount of bonds of the state of San Paulo, Brazil, to yield annually 8.47 per cent. The bonds are secured, according to announcement, by first charge on a surtax of 5 francs per bag levied on the export of all coffee produced in the state, bear 8 per cent interest and are due January 1, 1936.

H. M. Bylesby & Company are calling attention in an unique way to possible returns of $2,320 from an original investment of $760 in the Standard Gas & Electric Company's 6 per cent notes, due October 1, 1935. The notes are offered at 76, which gives the investor an annual income of 7.80 per cent for 14 years, with a 31.50 per cent profit on principal if both interest and principal are paid according to terms of the notes.

The Province of Nova Scotia has issued $1,500,000 of five-year, 6 per cent bonds, which are being offered by Wood, Gundy & Company at 93⅜ and interest, yielding 7⅝ per cent. Payment is required in American funds. Principal and interest are payable in either Canada or New York at the option of holders.

Miscellaneous Finance

GENERAL MOTORS EARNINGS

The annual report of the General Motors Corporation for 1920 was given to the stockholders, Tuesday, April 5. Net earnings were $82,762,063, as compared with $103,667,700 for 1919. Earnings applicable to common stock were $32,129,949, as compared with $55,792,972 for 1919. Surplus account increased from $78,641,897 at the end of 1919 to $121,273,217 at the end of 1920, with a corresponding increase in assets covering the same period from $468,737,345 to $604,806,868. President Pierre S. du Pont said:

"In the early months of 1920 there was promise of increasing annual sales and net profits. Volume of sales reached this expectation notwithstanding the sudden diminution of business during the latter quarter of the year, but the net profits fell somewhat short of 1919, although far in excess of any other year of the corporation's history. The decline of the latter months of 1920 has continued during the early months of 1921, but as this report goes to press there is evidence that the year will show a substantial recovery and a reasonably satisfactory business, with foundation well laid for future prosperity."

Comparative figures of surplus, net income and assets for three years are as follows:

	Surplus	Net Income	Total Assets
1918	$ 38,408,927	$25,804,576	$299,488,335
1919	78,641,897	103,667,700	468,737,329
1920	121,273,217	82,762,063	604,806,868

*In addition just received net income for 1919 is given as $103,667,700.

The directors have declared the regular quarterly dividend of 25 cents a share on the common stock and the regular dividends on the other issues.

INVESTMENT DEALERS ORGANIZE

At a meeting of Grand Rapids investment bankers and representatives of the bond departments of the banks, the Investment Bond Dealers of Grand Rapids was organized for the purpose of protecting its members and for furtherance of good fellowship and co-operation among the class. C. R. Kusterer is president; Warren H. Snow, vice-president; L. S. Hillman, secretary; James C. Everett, treasurer. Executive committeemen are A. E. Kusterer, H. W. Nelson, J. A. Whitworth, J. F. Barnett, Noyes L. Avery, J. D. MacNaughton and Russel J. Boyle.

NOBLE OIL ISSUES BONDS

As previously announced, the Charles F. Noble Oil & Gas Company is offering $3,000,000 of first mortgages 8 per cent convertible serial gold bonds, dated April 1, 1921, and due serially up to April 1, 1931, on a basis to net 8¾ per cent. According to announcement of Emmet L. Spracue & Company, the bonds are secured by a first mortgage on the entire properties of the company, now owned or hereafter acquired; the value of the physical properties as certified by Bauer & Clark is $17,244,435; developed oil producing properties, $1,556,487, and undeveloped properties, $470,267, a total of $19,271,290. Net profits for the year ended December 31, 1920, before taxes and depreciation, are given as $2,704,058. The bonds are convertible at par into common stock on the basis of $1.25 per share on or before March 31, 1922; $1.50 per share on or before Sept. 30, 1922, and $1.75 per share on or before March 31, 1923.

ADVERTISING NATIONAL SYSTEM

The First National Exchange Bank, Port Huron, of which Gust Hill is president, is carrying on a local advertising campaign pointing out the advantages of incorporation of banks under the federal law, and has offered $150 in prizes to the girl or boy of Port Huron who turns in the best essay on this subject.

MASS COPPER DEFICIT $48,403

The report of the Mass Consolidated Copper Company for 1920 shows total income of $27,338, as against total expenses of $75,742, leaving a deficit of $48,403. For 1919, income was $429,845 and expenses $575,951, a deficit of $146,106. The mine forces have been reduced to watchmen and caretakers. The directors have voted an assessment of $1 a share on the stock, payable April 15 by stockholders of record April 14. No stock will be transferred on the books after this date on which the assessment has not been paid. This assessment brings the total paid in on capital stock up to $25 a share.

A. T. & T. GOES UP

On July 15 the American Telephone & Telegraph Company will increase its annual dividend rate to 9 per cent. For fifteen years the rate has been 8 per cent, payable quarterly.

MOHAWK MINING NETS $632,762

The Mohawk Mining Company reports net profits before depreciation, depletion and federal taxes, of $632,762 for 1920. This compares with $570,635 in 1919.

THE LAW AND BUSINESS

EVERY CORPORATION LAW-YER knows the predicament of the foreign corporation which endeavors to do business in another state with authority only from the state in which it is domesticated. In many states corporations coming under the head of "foreign corporations" are required to obtain a license to do business. In Michigan, for instance, this requirement is known as "qualifying in Michigan."

While most large corporations are very careful to inquire about such laws before offering goods for sale or making contracts in other states, there is so little prohibitory restriction on such trading that "doing business in a foreign state" and "interstate commerce" are often confused. Often the distinction is very minute in the eyes of the law. In order to throw some light on this distinction we quote a few decisions of state courts in which the layman as well as the lawyer will be interested.

Example 1. A foreign corporation appointed an agent in Michigan to devote all his time to selling its goods. Goods were shipped to the agent, but title remained in the corporation until the goods were sold. The agent remitted each week the special price to him of all goods sold during the week, retaining the difference between that amount and the retail price as his commission. The Michigan Supreme Court held this arrangement to be "doing business," and denied the foreign corporation the right to sue on this contract since it had not obtained authority to transact business in Michigan before the contract was executed. E. A. Lange Medical Company vs. Brace, et al, 186 Mich. 453; 152 NW., 1026 Corp. Journal, No. 50.

Example 2. A foreign corporation engaged in manufacture and sale of patterns appointed a resident of Michigan as agent for its product. The contract provided that the corporation should sell and deliver F. O. B. at points outside of the state, its product at a specified discount from retail prices and allow the resident agent to return semi-annually such of the patterns remaining unsold in part payment for new patterns. The contract also provided for the purchase by the dealer of fashion sheets which, on specified terms, would bear his name and advertising. The Supreme Court of Michigan held that, although the contract was called a contract of agency, the resident was not the agent of the corporation in the state and the transaction so far as the corporation was concerned was interstate commerce and not "doing business" in the state. The corporation, therefore, could sue upon the contract in the local courts. Standard Fashion Company vs. Cummings, 187 Mich. 196; 153 NW., 814 Corp. Journal, No. 5.

Example 3. A New York corporation, without securing authority to do business in Michigan, sold, delivered and installed six superheaters in a power plant in Lansing. In an action to recover the price of $1.25 per heater, a new trial was ordered to permit the plaintiff to show that the installation of the superheaters was "such an essential requisite to the sale that it can be said that, but for the installation by the plaintiff, it could make no sale." It would appear that if this could not be proved the plaintiff could not recover. The decision in Browning vs. Waycross, 233 U. S., 16, wherein it was held that the sale and erection of lightning rods was intrastate commerce, is cited.

In its recital of facts in the case, the court says: "The superheaters were fully manufactured and made ready for shipment at the plaintiff's manufacturing plant at Dansville, N. Y., and were shipped in a knocked-down condition to the defendant's plant at Lansing, ready to be put together and installed. Plaintiff set up the superheaters in the two new boilers as they were being erected. In other words, the superheaters in these boilers were assembled by plaintiff and connected up before the boilers were bricked up. No brick work was to be done by the plaintiff on these boilers, it being necessary for him merely to install the superheaters as soon as the steel work on the boilers was completed. In order, however, to install the superheaters in the six old boilers it was necessary for the plaintiff to tear out the brick work in front, assemble and connect up in their proper places the pipes that made up the superheaters, insert the doors at the proper place, tie the pipes so as to hold them in place securely, and then brick the boilers up again." There was no evidence before the court as to whether this work could be done by the manufacturers through local workmen, and for that reason the case was sent back for a new trial. Power Specialty Company vs. Michigan Power Company, 190 Mich. 699, 157 NW. 408 Corp. Journal, No. 59.

Example 4. The B. F. Sturtevant Company entered into a contract with the A. Leitelt Iron Works for the sale and installation of a ventilating system in a high school at Grand Rapids. The contract was breached by the defendant, but plaintiff was unable to recover because at the time the contract was made he had not complied with requirements imposed upon foreign corporations doing business in the state. The Supreme Court of Michigan holds that "while the apparatus, the subject of the contract in this case" was somewhat complicated, it had no such "intrinsic or peculiar quality or inherent complexity" as made it necessary for the manufacturer to agree to install in order to effect sales generally; indeed, the contrary appears from the testimony of the plaintiff's witnesses. Many persons named by the witnesses purchased plaintiff's apparatus and made a business of installing it. The fact that the defendant

Is Your Money Efficient?

Mechanical efficiency is defined as the "ratio of energy-obtained to energy-exerted." Apply this definition to your investments. If the dollar you invest requires energy disproportionate to the money returned, your investment is inefficient. If you are receiving less than 6%, your investment mechanism needs lubrication. If you are striving for more, you are racing your motor.

Our First Mortgage Bonds offer a perfectly balanced ratio.

did not show there was a firm or individual in the State of Michigan capable of making the installation (apparently relied upon by the plaintiff) is, we think, of no consequence. The record does show that the apparatus of the American Blower Company was installed in place of that which the plaintiff contracted to install. The record shows that it was the claim of plaintiff that its apparatus was "equal to" the apparatus of the American Blower Company. B. F. Sturtevant Company, vs. Adolph Leitell Iron Works, 196 Mich., 552; 163 NW., 13 Corp. Journal, No. 71.

Banks and Bankers

DREHER GOES TO NEW ORLEANS

Harold J. Dreher, whose banking connections have included the National City Bank, First National Bank, Milwaukee; Marshall & Ilsley Bank, Milwaukee, and J. P. Morgan & Company, New York, has been elected vice-president and director of the Federal International Banking Company, New Orleans, the new foreign trade bank recently established under the Edge Act by 1200 southern banks.

NEW BANK AT TROUT CREEK

Trout Creek has a new bank known as the Tront Creek State Bank. J. S. Weldman, Jr., is president, and Percy W. Saxton, cashier. Mr. Saxton formerly was connected with the Isabella County State Bank, Mt. Pleasant.

JACKSON OFFICES EXTENDED

The Jackson State Saving Bank, Jackson, is remodeling the interior of its building and has extended the building by a 70-foot addition to the rear of its old quarters. The new safe deposit vaults in the basement will accommodate 2,500 box renters. The equipment is modern in every particular. The improvements in the main banking room involve putting in completely new furniture. Pictures of attractive marble and brass design give the remodeled structure the appearance of being a brand new building. The bank had total deposits of $1,840,543.41 February 21, with capital and surplus of $425,000.

BLOOMFIELD BUYS AN INTEREST

The Montgomery State Bank, Montgomery, has been strengthened hy the addition to its stockholders of A. C. Bloomfield, vice-president of the National Union Bank, Jackson. New officers of the Montgomery bank are George L. Tanner, president; O. K. Coolman, vice-president, and E. W. Barber, cashier.

PURCHASE AT BRECKENRIDGE

The Farmers State Bank of Breckenridge has purchased the First State Savings Bank of the same place, including the building, where the business of the combined institutions will be carried on. Directors and officers remain the same and capital of the Farmers State is increased to $37,500 from $20,000. Total deposits will be about $700,000.

KALEVA BANK REORGANIZED

A reorganization of the Bank of Kaleva has been effected and the institution is now known as the Kaleva State Bank. The officers are: President, Gust Haksiuoto; first vice-president, August Lens; second vice-president, Charles Billman; cashier, Ellsworth Billman; assistant cashier, Frank H. Wilson; auditor, Elmer Billman. The bank was originally organized nine years ago. The capital stock will be increased.

(*No. 5 of a series of examples*)

Must a Corporation Ascertain Whether Proposed Transfers of its Stock Are Authorized by the Owner?

Yes. For example, stock was surrendered (by a supposed agent of the owner) to a corporation and transferred on its books. Years after, the original owner alleged that the transfer was without his authority and void. Both the Secretary (Transfer Agent) and the supposed agent of the stockholder were dead. Records had been destroyed by fire. The Court held that the stockholder could not be deprived of his stock without his consent or negligence, and that the corporation was liable to the original stockholder.

As your Transfer Agent, the SECURITY TRUST COMPANY will relieve you of the difficulties involved in determining what are authorized transfers.

The Bond Between University and Industry

(Continued from Page 8)

has shown itself to be as vigorous and progressive as Michigan. The minute you cease to have problems you cease to be alive, and may such a day never come to Michigan.

Do you say, though, we have no problems of a joint character? There again I say that those industries of a similar type that cannot ally themselves with one another to the extent of finding problems of a joint character are not truly representative. They are not the type we desire in this state. Either they lack that spirit of co-operation so essential to present-day progress or else they have become decadent and will not long withstand the continual battering of modern business.

But do you say we are not sure whether we will get results since we have little choice in the selection of the men who will do the work or the methods of attack that will be pursued in an attempt to solve the problem? To these I would answer that the University will be only too glad to co-operate with you to find the right man or men for the given problem or problems. Men who will be assigned to problems will be chosen on the basis of their fitness irrespective of whether or not they are now connected with the University. As a matter of fact there is not now a man on the faculty who is not carrying a full schedule. This means, therefore, that the men who handle these problems must either come from the outside or else, if chosen from within, we must find men to take their present teaching positions.

Forming Research Committees

Some concern has been expressed that the Department of Engineering Research would develop into a testing bureau. No fear need be entertained on that score unless the industries themselves demand such a laboratory and will procure facilities so that such a laboratory may function. At the present time there are no funds available for the maintenance of a staff necessary for such a department and there is no building on the Campus for housing such a laboratory. As a rule most concerns have a laboratory of their own for such work and those that have not can send their routine work to laboratories established for just such purposes, who are in a position to render the service at a much lower cost than could be rendered at the University under present conditions.

It is believed that the Department of Engineering Research at the University of Michigan can be of distinct service and value to the industries of the state through the channels of centralized research. It is recommended that the industries of the state with interests closely allied join together. It is recommended that there be formed in each group a research committee to confer with the director of the Department of Engineering Research on matters relating to problems and policies. Included in this discussion there should be all matters relating to costs and details regarding how the problem or problems are to be approached, who is to take charge and other things of a pertinent and relevant character. The committee unless otherwise empowered should then report back its finding to the interests represented and procure from them authorization to proceed with the work. In the case of an individual industry the same general procedure should be followed.

The University has already pointed out to the industries that although desirous of doing everything in its power to be of service, yet it cannot assume, beyond a very nominal figure, the cost of the investigations and researches.

To be sure the facilities of the University Library are at the disposal of the industries. This library is among the largest in the country and is especially strong in technical books and periodicals. No research should be undertaken without a thorough study of the literature on the subject. Often such a search saves thousands of dollars. On February 1 the industries of the state were advised of this service but to date the resources of the library in this respect have not been scratched. I question if the industries of the state can afford to make as little use of libraries in the future as I believe they have in the past. Requests for service may be made either to the librarian or to the director of the Department of Engineering Research. This service includes the loan of books and periodicals and at a nominal charge abstracts, bibliographies and translations.

The service further includes the use of buildings and parts of buildings when not in use for instructional purposes. At the present time there is no space that can be set permanently aside for this work because of the large enrollment. One of our departemnt heads, for instance, has but one-half an office where he should have, if given the same facilities as members of the faculty have at Columbia and the Massachusetts Institute of Technology, two private laboratories and a private office.

Further, the use of equipment and apparatus, when not in use for instructional purpose, is placed at the disposal of the industries at a fee sufficient only to cover the cost of repairs, renewals and replacements.

The Present Budget

But little thought is necessary to appreciate how necessary it is for the passage of the budget now before the state legislature if the University is to serve the industries to advantage. The passage of this budget in its entirety is necessary, for there is not a single item that can be cut without seriously hampering the work of the University. In this budget $1,500,000 for an engineering laboratory is requested. It is vitally necessary that this sum be granted, since it will provide, at least temporarily, increased space for the College of Engineering and for the Department of Engineering Research.

When we realize that today we have no greatly augmented facilities for engineering training and research over what we had in 1910; when we realize that our student body in this college is today double what it was in 1910, with good prospect of being trebled by 1930; when we realize that the state has leaped into a commanding position from an industrial standpoint, with the value of its products increasing nearly five-fold in eleven years, or, to be exact, from $685,109,169 in 1909 to approximately $3,000,000,000 in 1926, is it not time to request increased and improved facilities to train men for the industries and also for research?

To sum up, therefore, the Department of Engineering Research is to be established for the purpose of assisting the industries in such proper ways as lie within its powers. It places at the disposal of the industries its library, its available laboratory space and equipment. The industry or industries requesting service pay labor charges, provide special equipment and pay a nominal fee for administrative expense and the use of equipment. As a state institution it cannot grant special privileges. Therefore work on which patents are desired or privileges with regard to matters of publicity cannot be accepted. It is recommended that the various main groups of industry join together on a basis, each of a joint character be placed before the Department of Engineering Research for solution. It is believed that by this joint co-operative alliance large sums can be saved each company. The present day is unquestionably one of co-operation, economy and a strong belief in the value of properly conducted research. The department of Engineering Research is founded on these principles, trusting that it may be of service to the industries of the state, through them to the people at large, and that in rendering service to these groups it may be credited with duly laboring for the cause of true science, of which research is the chief if not the only servant.

A paper presented before the Detroit section of the Society of Automotive Engineers, at the Board of Commerce, March 25.

Mississippi Valley Ass'n To Meet in New Orleans

The Mississippi Valley Association will hold its third annual convention in New Orleans May 2, 3 and 4, bringing together representatives of 27 states and 28 foreign countries. The convention will have been looked to more than 10,000 interests in the Mississippi Valley, representing nearly every industrial, commercial and professional activity in this section of the country.

Probably the oddest thing about this convention call is the announcement that there will be no set speeches. Instead, there will be a series of open conferences on such vital subjects as transportation, waterways, reclamation agriculture, merchant marine, economics and foreign trade. It is the conference on foreign trade that brings the delegates from 28 countries to tell the convention their views and ambitions in world commerce.

While the convention is in session the $20,000,000 Industrial Canal connecting the river harbor of New Orleans with Lake Pontchartrain, an arm of the Gulf of Mexico, and with Bayou Bienvenue, a navigable river connecting the canal with the gulf, will be opened. This canal is 200 feet wide, 30 feet deep at all times and provides 11 miles of frontage to be leased to industries and transportation companies.

Harry H Merrick, president of the Great Lakes Trust Company, Chicago, president of the Association, will preside at the convention. Among the delegates from Detroit will be John C. Carr, Detroit, director of the Association for Michigan.

NEW CORNELIA REPORT

The 1920 report of the New Cornelia Copper Company shows net earnings of $391,137, which is equal to 55 cents a share on the capital stock, as against $17,216, or about one cent a share, in 1919.

KALAMAZOO POST OFFICE BUSINESS

Another indication that Kalamazoo is not "standing still" is furnished in the report of the post office's business during 1920, which shows a total of $311,348 taken in, compared with $294,764 in 1916; $270,275 in 1900; $48,382 in 1880; $18,105 in 1860; $15,654 in 1870; $5,200 in 1860; $2,516 in 1850 and $1,384 in 1840. Business at the post office now is averaging more than $1,000 a day, which is a substantial increase over the business done in past years and fully equals the average business done in 1919, when 3-cent postage was in effect.

Eight Hour Bill Beaten

(*Continued from Page* 15)

it would discriminate against this state in favor of outside and mail order concerns.

Senator Barney E. Brower's substitute for his measure to require steel vestibule cabs for all engines was reported out by the railroad committee with recommendation for its passage. The substitute would give the utilities commission the power to order a steel vestibule on an engine.

The corporation bill, an administration measure, passed the Senate with three amendments, lowering the tax upon building and loan associations, protecting non-paying ore mines and exempting foreign insurance companies. The Senate also passed Rep. Andrew B. Glaspie's joint resolution asking Congress to restore state control over intra-state railroads.

The MacDonald bill making a number of amendments to the compensation act for the benefit of the workman, was reported out by the labor committee. The committee placed the maximum death compensation at $7,000, the present law fixing the limit at $6,000. The present provision allowing 60 per cent of the wage up to a certain amount was not changed to the 66 2-3 per cent as proposed in the original bill. The new provision giving the industrial accident board jurisdiction over cases in which men are injured out of the state but while working under contracts signed in this state, stands, as does the compensation benefit to include employes of the public, except elective officials. It also makes sub-contractors liable. Police and firemen are given the right to elect between a municipal and state benefit, but cannot have both.

Among the bills passed by the House was the Copley measure, which would require all public utilities under the jurisdiction of the commission to pay all expenses of appraisals, book audits, etc., made of their property, the money to go into the general fund for the expenses of the Commission.

The Evans bill increasing the maximum amount of highway road bonds which may be issued annually from $5,000,000 to $10,000,000, and the interest rate which may be paid from 5 to 5½ per cent, also was passed.

Senator W. A. Lemire, Escanaba, introduced a bill in the Senate to further the restrictions upon food manufacturers and dealers by protecting the consumer from mislabeled articles. Under the bill every article of food must have an accurate label showing its contents and the quality contained. Violations would be punishable under the pure food statutes, of which it would be a part if passed.

New Refrigerating Unit Will Be Made in Adrian

After a number of years of experimental work in its plant at Harper avenue and Rivard street, Detroit, the Utility Compressor Company has perfected an iceless refrigerator unit, which, it is confidently expected, will revolutionize the present systems of iceless cooling. The company will begin production in a new plant in Adrian in August. The Detroit factory has been suitable for experimental work but is not considered adequate for quantity production.

The company has taken the view of many manufacturing concerns that plant development and manufacturing can be better accomplished in the communities of moderate size than in the larger cities, and for that reason has ordered plans from Baxter, O'Dell & Halpin, Detroit architects, for a plant in Adrian. The manufacturing space provided will be about 20,000 squnre feet. The old factory has been sold to the City Patern Works.

This new type of iceless cooling unit dispenses with pipes, running water, stuffing boxes and much of the other machinery necessary in artificial cooling systems. The entire unit is enclosed so that no running parts are exposed. It can be attached to any refrigerator by the simple process of cutting a hole in the top of the box, adjusting the machine and connecting it to an electric lighting socket. The temperature is maintained automatically. The whole refrigerator space is reserved for food.

The officers of the company are E. R. Hasse, president; J. W. Foster, vice-president; G. J. Lehmann, secretary, and T. P. Stephens, treasurer.

MICHIGAN'S 1920 COAL OUTPUT

Statistics concerning coal output per state in 1920 have been announced by the Department of the Interior, the figures being the approximate estimates, and not final. The total production of bituminous coal for the country, according to the tabulation, was 556,563,000 tons, as compared with 458,063,000 in 1919; 579,385,820 in 1918 and 551,790,563 in 1917. The output of anthracite is estimated to have been 89,100,000 tons, as compared with 88,092,000 in 1919, 98,826,084 in 1918 and 99,611,811 in 1917. The grand total of coal produced was thus 645,663,000 tons last year or 99,599,000 more than in 1919 but 32,548,904 less than in 1918 and 5,739,374 less than in 1917.

The production credited to Michigan was 1,440,000 tons, or 210,000 more than in 1919, but 64,000 less than in 1918 and about 70,000 in excess of the 1917 output. Pennsylvania tops the list, with 163,000,000 tons; Illinois is second, with 90,050,000; West Virginia, third, 87,500,000; Ohio, fourth, 45,000,000; Kentucky, fifth, 31,000,000, and Indiana, sixth, 30,000,000. The anthracite output is all credited to Pennsylvania.

REINCORPORATING AT OTSEGO

Owing to the expansion of the business, and the fact that the original issue of the preferred stock is now retirable, directors of the Otsego Furniture Company have decided to dissolve the company and wind up its affairs as provided by law. A petition asking for a dissolution has been filed in the Allegan circuit court. H. Lyle Johnson, Kalamazoo, and H. D. Lanz, Otsego, have been appointed temporary receivers, and have assumed the management. The directors say that the concern is amply solvent. A reorganization to take over the plant and business at the conclusion of the receivership is under way.

NEWAYGO CEMENT ELECTION

The Newaygo Portland Cement Company, Newaygo, has re-elected Clay H. Hollister president and treasurer; Wilder D. Stevens, vice-president; J. B. John, vice-president and general manager, and W. A. Ansorge, secretary and assistant treasurer. The directors are the officers and P. H. Travis and Fred Vogel, jr., Milwaukee; H. D. Higginbotham, Joliet, Ill., and Mrs. Daniel McCool.

$150,000 ADDED TO CAPITAL

The St. Joseph Iron Works, St. Joseph, has increased its capital stock from $60,000 to $250,000—$150,000 being preferred and $100,000 common. The company is said to be planning increased activities. Its officers are: President, John Lindt; secretary, W. E. Hatch; treasurer, G. F. Filbrandt. These officers and Herman Hintz and John Eklund comprise the board of directors.

FORD CLOSES CORK PLANT

The Ford Motor Company has closed its tractor plant in Cork, Ireland, indefinitely. Fifteen hundred men have been laid off.

Drafting a Standard Form of Contract

(*Continued from Page 8*)

This will be true, because, whereas a firm may not hesitate to break a special agreement which exists between it and some other one firm it certainly would hesitate to break a generally approved contract which has back of it all the prestige and influence of the constructive business interests of the whole country.

Further, court costs and liquidation would be immensely reduced by the establishment of such a standard contract form. This would be true because in a short time there would be supreme court rulings upon each clause and paragraph in the contract. Then each party to such a contract would know in advance what decision the courts would render without the matter having to be taken to court.

In line with the program outlined above, the National Association of Purchasing Agents is now proceeding with the first step. This is to be carried out as follows:

Each of the national commodity committees will work out a contract form covering the special needs of their particular commodity or industry. This will then be submitted to each of the various trade, manufacturing and professional associations representing all of the constructive business interests of the country. The various criticisms, suggestions for changes, etc., will be worked out as presented. Whenever necessary, conferences will be called between the representatives of the various associations to work out the important points upon which the various parties differ.

Then finally when the various commodity contracts are worked out they will be turned over to the standardization committee. This committee will then draw up a basic standard form of contract, which meets the needs of every industry, and, in conjunction with the commodity committees make provisions for the special modifications which are necessary to meet each special commodity requirement.

In the undertaking of this definite program the National Association of Purchasing Agents desires every business firm and association to understand that it is not going to set up a contract whose chief purpose is to satisfy buyers. Such a contract form would never be generally accepted. Instead the entire aim is to carry out that program which best serves the needs of the business welfare of the entire country.

In any such movement it is necessary that some organization take the initiative and see that the work is kept moving. It is also necessary that such an organization have the confidence of the business public in general.

The National Association of Purchasing Agents has gained the confidence of business men and business organizations everywhere because from the very beginning its entire work has been of practical, constructive benefit and never directed towards obtaining any unfair, selfish advantage. Also, through the manner in which it proceeded with and carried out the establishment of a standard catalog size and a standard invoice form, it has gained the confidence of the business world to its ability and in its absolute fairness to carry out such work.

The readers of this publication will be kept informed as this work progresses. Constructive criticism and suggestions from everyone will be welcomed. Also, any business association or organization desiring to keep directly in touch with this work is invited to write to the national headquarters of the National Association of Purchasing Agents, 19 Park Place, New York city.

THAT FORD BALANCE SHEET

ASSETS	Dec. 31 1920
Real estate	$ 59,861,000.92
Goods, chattels, merchandise, notes, etc.	124,350,296.39
Cash	12,857,244.51
Good will	21,262,833.46
Receivables	54,425,632.50
All other assets	20,084,032.85
	$284,554,041.55
LIABILITIES	
Capital stock	$ 17,264,500.00
Liabilities	143,025,300.00
Surplus	124,264,241.55
	$284,554,041.55

The above statement has been arrived at by taking the actual items of assets reported by the secretary of state of Michigan and deducting admitted liabilities to total admitted assets to find surplus. It is interesting notwithstanding its lack of definiteness because it may be compared with a similar statement filed July 31, 1920, with the Delaware authorities. In the Delaware statement the items are grouped differently than in the above, but some of the comparisons are as follows:

	Lansing Statement Dec. 31, 1920	Delaware Statement July 31, 1920
Total assets	*$284,554,041	$206,695,109
Surplus	124,264,241	165,679,122
Cash	13,557,244	142,499,929
Real estate	59,861,000	85,549,726
Cash and receivables	67,798,877	85,499,029

*Less authorized capital of $100,000,000. Includes accounts receivable.

in the Lansing report $100,000,000 of capital stock authorized is included among the assets which has been deducted in making up the December 31 balance sheet.

FINANCING LANSING EXPORTS

James R. Otto, manager of the foreign department of the Capital National Bank, Lansing, reports that Lansing manufacturers are rapidly increasing their foreign trade so that in some cases shipments even exceed those before the war. Banking connections for local concerns are being opened in South America, Europe, the British Isles and the Orient. Trade with Germany has also increased. Automobiles and parts comprise the chief exports, and most of the products are going to Latin America, Britain, Germany and Poland. Local trade with Australia has grown since the overruling of the government regulation requiring Australians to buy at the current rate of exchange, and allowing them a permanent rate. The Capital National Bank's foreign department is financing many shipments through a credit system of its own, which heretofore had to be done through the New York office. A foreign banking and credit business may be done through the mail.

UNITED LIGHT AND RAILWAYS

Surplus earnings of the United Light & Railways Company for the twelve months ended December 31, 1920, are $916,084.16 after paying all expenses, taxes, maintenance, interest, and preferred dividends. The surplus earnings for the year 1919 were $482,943.07. Thus for 1920 there was an increase of $333,141.06, or more than 70 per cent.

NEW BOND AND MORTGAGE CO.

Organization of the Grand Traverse Bond & Mortgage Company, Traverse City, has been announced. The officers are: President, J. D. Munson; vice-president, M. D. Bryant, J. O. Duncan and C. B. Hammond; secretary, L. P. Titus; treasurer, E. P. Allen. Offices have been opened in the Beadle building.

TRUSCON STEEL STATEMENT

Assets	Dec. 31, 1920	Dec. 31, 1919
Cash accounts	$ 300,715.82	$ 246,238.68

CENTENNIAL COPPER CO.

Coincident with the drop in the market value of copper is the report of the Centennial Copper Company, Lake Linden, for 1920, just received. Loss from copper delivered was $39,-816, as compared with $48,029 in 1919. Production cost of 561,284 pounds of copper in 1920 was 36.17 cents a pound, as compared with 24.64 cents for 1,365,148 pounds in 1919. The income statement and balance sheet follow:

Received for copper delivery	$172,829
Cost of copper	212,646
Loss on copper delivery	39,816
Loss by red. of copper	87,509
Deficit	127,325
Miscellaneous receipts	4,347
Net loss	123,177
Add Federal tax, 1918	7,811
Inc. in capital invest	24,748
Total loss	155,891
Inc. in res. for deprec. & depl	12,024
Final loss	159,746

Principal assets and liabilities as of December 31, 1920:

Cash	$110,414
Accounts receivable	24,486
Liberty bonds, 3rd	1,400
Liberty bonds, 4th	25,650
Copper on hand	48,095
Supplies at mine	36,843
Total	$246,870
Current Liabilities	
Accounts payable	$ 22,467
Excess of assets	223,403
Total	$245,870

A BLUE SKY DECISION

Under a decision of the Michigan Supreme Court given last week in the Detroit case of the state against Frederick E. Clum, it was ruled that so-called common law trust associations, even though not incorporated under Michigan or any other state laws, but which sell stock in this state, are within the purview of the blue sky law and violate it when they sell stock without the approval of the Michigan Securities Commission. In May, 1920, Clum solicited and sold stock issued by the National Business Men's Protective Association, and certificates were issued to investors purchasing it. The capital stock was given as $25,000 preferred and 7,500 shares non-par common. Clum was convicted in the Detroit recorder's court and appealed to the Supreme Court on the ground that the association was a common law trust and did not come under the law.

New Centerless Grinder Brought Out

(Continued from Page 14)

indrical extension of bearing of lower wheel which consists of a clutch operated by pulling the hand wheel endwise. An outward motion will rotate the wheel at proper work rotating speed, while an extreme inward push will disengage a back gear which will throw the wheel in high speed for wheel trueing purposes. If work of unusually large diameter is presented by mistake to the machine, the moment the operator notices the heavy cut he can grasp the hand wheel and push it toward the wheel and the wheel will stop instantly.

A month's test on actual production has shown that the machine has an hourly earning capacity of $4 to $10. Thie is based on present market prices for grinding piston pins.

A machine will be exhibited at the annual Car Builders' convention to be held in Atlantic City, as well as one in the near future in Chicago in the Machinery building, with the E. L. Eesley Machinery Company, the Chicago agent.

McGRAW BUILDING ON MARKET

The Detroit Journal says the McGraw building, at Griswold street and Lafayette boulevard, Detroit, is on the market and that several propositions looking to its future use either have been or are under consideration. One plan is said to involve the erection of a 33-story office building on the site, which is assessed at $1,000,000. Another has to do with an extension of the Free Press building. The Detroit Trust Company handles the property for the McGraw Land Company, owner of the corner. George H. Kirchner, president of the First State Bank of Detroit, which occupies the lower floor of the building, said the bank had not made a decision as to a new location when its present lease expires in 1924.

MICHIGAN MORTGAGE INVESTMENT

The Michigan Mortgage Investment Company, Lansing, distributed its regular quarterly dividend of 1¾ per cent on the preferred stock April 1 to stockholders of record March 20. The distribution totaled $18,715.59, making a grand total of $113,742.84 which the company has distributed since its organization, besides two stock dividends.

CONTRACTORS TO SELL STOCK

Gohr Brothers, Lansing, contractors, will sell about $20,000 of their reserve stock to assist in financing a number of road contracts. The concern was incorporated for $75,000, but only $54,000 has been sold.

CITIES SERVICE DISTRIBUTION

The twenty-sixth monthly distribution on Cities Service Company bankers' shares, payable May 2 to bankers shares of record April 15, will be 35 cents, the same distribution as made April 1.

WILL BUILD AT GRAND LEDGE

Plans are being made for the erection of a building for the Loan & Deposit Bank, Grand Ledge. E. P. Mills, formerly cashier of the South Lansing branch of the Lansing State Savings Bank, has been appointed cashier of the Grand Ledge bank.

DURANT-STUDEBAKER REPORTS

Some of the New York newspapers have published reports to the effect that William C. Durant has acquired a good sized block of stock of the Studebaker Corporation. His holdings, along with those of E. R. Erskine, president of the corporation, and Frederick S. Fish, chairman of the board of directors, are said to amount to more than one-half the stock.

The Real Battle Is Yet to Come

(*Continued from Page 10*)

Hughes declared. The grain-growing sections of Australia, Austria, Russia and India are closer to seaboard by many miles than the Middle West of the United States and the Canadian farm lands, he said.

Mr. Macomber also challenged Mr. Hill's statement that the railroads could handle the traffic when there were no war conditions to interfere. He asserted that of the 2,500,000 freight cars in use, five-sixths were in movement and the rest idle. He questioned the ability of the remaining one-sixth of all available freight cars to care for traffic resulting from a renewal of business activities. The average car miles a day was given as 33 3-10 and the average time from Toledo to New York city as thirty days, whereas the shipment by water to Liverpool from Toledo would not exceed fourteen days. He called attention to the continuous embargoes from January to June, 1920, as sufficient evidence of the "ability" of railroads to handle traffic and the conditions obtaining at the New York terminals.

Summed up, the entire flow of testimony in the final hearing bore out the statement of Mr. Russell that the railroads needed supplemental waterway transportation and the country needed it; that whereas the great railroads of the United States and Canada were built in the belief that the growth of the country would justify their existence, which belief was sound, the necessity of the Great Lakes-St. Lawrence route is apparent from present transportation conditions and present tonnage, and not dependent for its justification upon what the future may bring.

New Publications

AUTO ELECTRICIAN'S GUIDE

The Michigan State Auto School, Detroit, has issued a new volume of its Auto Electrician's Guide, a compilation of automotive wiring diagrams. The Guide is complete in two volumes, the two together containing more than 1,700 different wiring diagrams, ranging from 1906 to 1921. This is said to be a much larger number than any similar book issued to date has approached.

The price of the Auto Electrician's Guide is $15 complete. It can be had from the Auto School, 3729 Woodward avenue, Detroit.

CUTLER-HAMMER PUBLICATION

The C-H Enclosed Switch, used for starting polyphase squirrel cage motors, is described and illustrated in Publication 2046, which is a two-color, four-page imprint folder of envelope size. The first page bears the caption, "Start 'Her up, Bill," and shows a view in an industrial plant, with "Bill" moving the lever of the Bulletin 9116 Switch in the process of starting the motor. The folder states that this switch protects the motor by inserting the fuses in circuit only after the motor has reached speed, thereby avoiding over-fusing of the motor to carry the heavy inrush current. The totally enclosed structure of the switch protects the workman from injury by accidental contact with live parts. When the switch is "off" and the fuses are dead, a sliding panel on the enclosure case can be lowered to allow inspection and renewal of fuses.

Copies of this publication may be had on application to the Cutler-Hammer Manufacturing Company, Milwaukee.

DETROIT AUTO CLUB ISSUES GUIDE

The Detroit Automobile Club has just issued to its members at 50-page booklet entitled "Marked Roads," which is going to be a valuable asset to members driving in the environs of Detroit. The map shows the state roads as well as the county roads and gives several optional routes for the same trip in many cases. The book alone is worth the price of membership in the club.

ARIZONA ROADS

Better Good Roads for Maricopa County, Arizona," the name of a new booklet published by the Lakewood Engineering Company, Cleveland, describing Twohy Bros.' 280-mile road job. The booklet is mostly pictures, reproduced in brown duo-tone ink on very fine paper. A cactus plant on the front cover gives some idea of the nature of the country in which this road building program is being carried out.

Copies of the booklet will be sent free on request.

REORGANIZING KILLEN KEMICAL

The Killen Kemical Kompany, Lansing, has been placed in the hands of a receiver by Judge Carr, of the Ingham circuit court, as a result of petitions made by executives of the company that the present trusteeship be terminated and receiver appointed. Joseph Gerson took charge of the plant's finances and promises creditors he will make every effort to pay them in full. An unusual legal tangle is involved in this receivership. The concern was brought to Lansing last September from Marinette, Wis., by D. J. Killen, president. In order to avoid Michigan corporation laws, the company organized under a common law trusteeship, a procedure not recognized in Michigan courts. It is an old English law which empowers a man to place his properties in the hands of plenipotentiary trustees, a statute that is still in force in Massachusetts.

President Killen resigned February 5, withdrawing his stock and leaving the other executives to bear all responsibilities as trustees. These executives are R. W. Johnson, secretary; J. F. Murphy, vice-president; E. A. Golden, treasurer; H. C. Nielson, chemist, and Dewitt Hungerford, trustee. When it was realized the company could get no further under these conditions, action was taken to end the trusteeship and name a receiver to continue until the company can be incorporated under Michigan laws. The company manufactures oils, greases, soaps, paints, varnishes and a patented antifreeze solution known as "Hot Frost."

BRIER HILL STEEL'S DIVIDEND

J. B. Kennedy, chairman of the board of the Brier Hill Steel Company, is quoted in an eastern newspaper as saying that unless there is a decided improvement in steel buying during the second quarter of the year it is probable there will be no July 1 Brier Hill dividend. A dividend payment of 4 cents a share was announced for the first quarter, as against a payment of 60 cents on the junior stock for the preceding three months.

PONTIAC EMPLOYES' BENEFIT ASS'N

The Pontiac Employes Mutual Benefit Association paid out $47,621 during 1920, or $17,600 more than in 1919, according to announcement made at the annual meeting, recently. The total number of claims was 1,092, of which 638 were for sickness, 431 for accidents and 28 for death benefit. Benefits paid were as follows: Sickness, $24,456; accident, $18,563; death, $4,602.

Since the Association was formed, some years ago, there has been paid out $77,643 as follows: Sickness, $40,960; accident, $33,756; death, $5,827. The average benefit paid to members is $35.01; the average absence on account of sickness, 17.2 days; accidents, 16.4 days. Total assets of the Association are listed at $53,329.

The election of officers for the year resulted as follows: W. A. Booth, Wilson Foundry & Machine Company, president; O. I. Van Schoick, Hubbard Spring Works, vice-president; George Westbrook, General Motors Truck Company, treasurer; C. S. Skelton, manager and secretary of the board of trustees. Trustees: Clayton Springer, Oakland Motor Car Company; Chris Bachner, Eames & Brown; Harry Elkins, Iless-Pontiac Company; Frank Stout, Michigan Drop Forge Company; George Eaton, O. J. Beaudette Company; Edward Goulet, Slater Construction Company; Vern Rohn, Consumers Power Company; D. L. Brown, Pontiac Daily Press, and the officers.

TWO NEW INDUSTRIAL FILMS

Two new educational motion picture films are announced as being ready for distribution by the United States Bureau of Mines.

"A dollar saved is a dollar earned" is the title of a film produced in co-operation with the National Association of Pipe Covering Industries. This film shows the advantages and economy that result when pipes and boilers are properly insulated and radiation losses thus overcome.

"The story of ingot iron," a three-reel picture showing the various steps in the process of making ingot iron for plates and sheets, was produced in co-operation with the American Rolling Mills Company, Middletown, Ohio.

Requests for the loan of these films should be addressed to the Bureau of Mines, 4800 Forbes street, Pittsburgh.

AMERICAN SHIPBUILDING CO.

The American Shipbuilding Company in announcing its regular quarterly dividends on the common and preferred stocks, also the usual extra dividends, has disposed of rumors that these payments were to be passed. The Cleveland Plain Dealer says: "Prior to 1917 the company paid dividends on a hit-and-miss plan, as the preferred stock is a non-cumulative issue. However, it paid the regular 7 per cent dividend on the preferred since date of organization to January 15, 1914. No more was then paid until 1916, when 8¾ per cent was distributed. The regular dividend has been paid since. On the common stock 60½ per cent has been paid in cash and 15 per cent in Liberty Bonds since 1917, as follows: 8½ per cent in 1917; 12 per cent cash and 15 per cent in Liberty bonds in 1918; 16 per cent cash in 1919 and 1920, and 8 per cent in cash thus far this year."

ENGINEERS' PROGRAM APRIL 12

The subject, "Cost Analysis as a Device for Executive Control," will be discussed at the meeting of the Detroit Chapter, Society of Industrial Engineers, at the Board of Commerce, April 12. The question will be taken up first by Clinton H. Scovell, of Scovell, Wellington & Company, accountants and engineers. After the address there will be an open discussion. A. G. Sherman, general manager of the Detroit Vapor Stove Company, and R. J. Houser, comptroller of the Penberthy Injector Company, will be among those speakers. The chapter also has arranged for a talk to be given at a noon meeting of the Board of Commerce, to be announced shortly.

NEW HARBOR SPRINGS ENTERPRISE

Official announcement is expected to be made at any time of the establishment of a new industrial enterprise in Harbor Springs. Those principally interested, Chicago business men, asked, it is said, that $10,000 of the concern's capital stock be subscribed by local people, which was done. It is reported that the company will occupy the property formerly used by the Cadillac Handle Company.

U. S. Copper Production Practically at Standstill

Practically the entire porphyry copper mining industry in the United States came to a standstill March 30. Temporary suspension of mining operations was announced by the Anaconda, Utah, Ray Consolidated, Chino and Nevada companies, while the Inspiration and North Butte companies closed down the week previous. These seven concerns have a total productive capacity of about 1,000,000,000 pounds of copper a year, although last year their output was about half that amount. It is expected other companies will act similarly.

Lack of domestic and export demand, coupled with large surplus stocks, was given as the reason for stoppage of production, which at present costs and the price of the metal around 12 cents a pound was a losing venture. Officials of the companies expressed the opinion that the shutdowns would be only temporary and that normal production would be resumed at general industrial conditions become easier.

"Suspension of activities was ordered with regret, and only after deliberate consideration compelled the conclusion that under existing conditions no other course was advisable," said John D. Ryan, chairman of the Anaconda Copper Mining Company. "The mines and plants are in good condition and can and will be so kept that a normal production at reasonable cost can be made quickly whenever there is sufficient improvement in the business situation to warrant an output on an economic basis."

"Continuation of production which cannot be sold at the cost of production would lead only to later demoralization, a detriment to stockholders and ultimately a much greater pecuniary loss to employes," said Charles Hayden, a director in several of the companies. "Copper is a basic industry and it is the belief of the managements that rehuilding of commercial industry in this country and abroad will not require a long period of shutdown."

REALTY DEVELOPMENT CORP.

The Realty Assurance Corporation, 1402 Real Estate Exchange building, Detroit, announces that its name has been changed to Realty Development Corporation, for the reason that the former name did not clearly indicate the nature of the business, which is confined to the development of real estate. The change of name in no way affects the personnel, organization or business transactions of the corporation.

NEW PUNCH AND RIVETER

A new machine is being manufactured by the Baird Pneumatic Tool Company, Kansas City, Mo. It may be used either as a punch or riveter simply by changing the dies. Among the many advantages claimed for the machine is the fact that although it is a stationary unit, it can be readily moved from place to place in the plant where the work is located, as it weighs only 600 pounds complete. It has a capacity for punching ⅝-inch plate and for riveting ⅝-inch cold rivets, and because of this dual use is practicularly adaptable for light structural steel fabrication. The pressure exerted on the punch and rivet dies is approximately 70,000 ponnds. It operates on the standard airline pressure of 100 pounds.

ST. JOHN'S COMMERCIAL CLUB

The St. Johns Commercial Club, St. Johns, at its annual meeting elected George H. Chapman, president; A. E. Wilson, vice-president; A. L. Rand, secretary, and R. C. Dexter treasurer.

TO BUILD CANNING PLANT SHORTLY

Work on the canning plant to be erected in Greenville is expected to be started shortly. Officials of the company have acquired the site of the old Greenville barrel factory.

Yankee Ingenuity and World Banking

(*Continued from Page 12*)

February; Great Britain, $93,000,000, as against $169,000,000; France, $20,000,000 as against $65,000,000. Nearly every country shows similar decreases in purchases of our goods except Germany, and it is noteworthy that this "bankrupt" country bought $39,000,000 from us in February this year, as against $18,000,000 last year. Germany also increased her sales to us from $3,881,559 in February, 1920, to $4,952,278 in February this year.

Alright, some have said, how about the improvement in business the last thirty days in spite of falling exports? That improvement is simply the natural rebound from overmuch contraction. Yankees never take the middle of the road. When the price of Ford cars was cut, September 21, we all dropped into low speed, put up our side curtains, put on our chains and generally prepared for and acted as if, we were going into a hurricane. But we have found since that it was merely a healthy rain storm and business is now getting back to the speed which sanity and normal demand require.

But the need for a machine to revive foreign trade is none the less on this account. The new foreign trade financing corporation when it gets on its feet will furnish you the means of selling goods to Constantinople, where they are crying for machines to make bread. It will enable you to supply merchants in Egypt, who are calling for soap, perfumery, kitchen utensils, glassware, linoleums, alcohol and motorcycles, and to supply a large Greek importer house with motor cars and typewriters. These are positive efforts to buy goods about which any of you may obtain specific information by addressing the American Manufacturers Export Association, at New York. And if this new bank were doing business today, as it will before long, you would be getting some of this business. The amount of stock that any manufacturer may be asked to take is insignificant compared with the possible profits that are ours when the possibilities are considered. And the best of it is, under the system of issuing debentures which the new bank will use, the very profits we make will be the source of new capital for making additional profits. Every $100 of stock paid in gives the bank the means of issuing $1,000 of debentures. And every workman who buys a debenture is in a sense creating a job for himself because the proceeds of the debenture immediately begin to finance part of a sale of goods, and the sale of course makes additional demand for labor here at home.

As to the safety of this foreign trade bank, we have as a guide the time-tried foreign financing concerns of Great Britain, which have been doing this business since 1578, when the Eastland Company was organized. And similar concerns have been in successful operation ever since, until in 1914 European countries had outside investments of more than $39,000,000,000. But the outstanding feature of these European companies is that the best managed ones have earned an average of more than 12 per cent above all expenses and losses for many, many years.

The best information obtainable is that Governor Harding, who successfully piloted our banks through the war, will become managing head of this new bank, which in itself is a guarantee of safety. And thus the situation resolves itself simply into this: Given, a 16 per cent surplus of goods and crops, ships, men and factories, plus reliable and tested management, are we going to let European foreign traders beat us to it, so to speak, while we bem and haw about raising capital? I think not. The potentiality of this new banking is steadily making converts, and before long, when the bandwagon starts, we will all be scrambling for front seats and the rest of the world will again be marvelling at Yankee "pep" and ingenuity.

Public Utilities

Gaylord—After August 1 the electric lighting and pumping plant of Gaylord will be owned by the Cheboygan Electric Light & Power Company, Cheboygan, which will then furnish power to the following municipalities: Gaylord, Mullet Lake, Long Point, Topinabee, Indian River, Wolverine, Mackinac City, Carp Lake, Levering, Pellston, Brutus, Alanson, Oden and Conway. The deal made between Gaylord and the company provides that the town retain charge of water mains.

Lansing—The Michigan Public Utilities Commission has approved the agreement of the holders of the 15-year, 5 per cent consolidated mortgage gold bonds of the Lansing Fuel & Gas Company to extend payment on these bonds. They were due April 1, 1921, but the payment has been extended for 10 years and the interest raised to 7 per cent. The agreement has been executed by the gas company the Central Trust Company of Illinois as trustee, and by the Pennsylvania company as bondholder.

Evart—The Winterfield Light & Power Company has been reorganized with the following officers: John M. Perry, Tustin, president; A. H. Rose, Evart, secretary; William Rogers, Evart, treasurer. Directors: Henry Multner, Lake City; William Gustafson, Leroy; W. L. Kenney, Marion; and Messrs. Perry and Rogers. Under the new plans of the company it is proposed to erect a dam across the Clam river in Winterfield township. The company will furnish electricity to Evart, Leroy, Sears, Lake City, Marion, McBain and Winterfield.

NEW ENGINEERING CONCERN

The Engineering Equipment Company, capitalized at $12,000, has been incorporated in Lansing for the purpose of conducting a general sales and engineering business. The concern is headed by Harry L. Conrad, chief engineer of the local branch of the H. G. Christman Company, assisted by J. C. Gunnell and O. E. Eckert, Lansing.

Ernest T. Ross Joins The Corrigan Company

Ernest T. Ross, Chicago, has been engaged by the Corrigan Company, investment banker and broker, Grand Rapids, to be associated with John D. MacNaughton, manager of the bond department. Mr. Ross has had a wide

ERNEST T. ROSS

experience in the bond business and has been connected with Devitt, Tremble & Company, Chicago, one of the oldest bonds houses, for a good many years. For the past three years he has been associated with Halsey, Stuart & Company as their Michigan representative.

Basil Barker, the oldest employe in point of service of the First National Bank, Allegan, has been advanced to the position of cashier, owing to the resignation of Walter Miller. Marinus Van de Baute has become assistant cashier.

The Vanadium Corporation of America, which paid a dividend of 11.50 on its common last year, reduced this to 11 three months ago, has passed the dividend now due.

The regular quarterly dividend of 1¾ per cent on the common stock of Fairbanks, Morse & Company has been passed.

The Edmunds & Jones Corporation, Detroit, has passed the dividend on the common stock due at this time. The preferred dividend was declared as usual.

The National Grocer Company has passed the quarterly dividend of 2 per cent on the common stock.

The Merrell Manufacturing Company has passed its quarterly dividend of 1¾ per cent on the preferred stock.

The Loose-Wiles Biscuit Company has declared a dividend of 1¾ on the second preferred stock for the period from May 1, 1916, to August 1, 1916.

GRAND RAPIDS EVENING OPENING

The Grand Rapids banks which belong to the clearing house association will hereafter keep open Thursday evenings from 6 to 8 o'clock, effective April 1, for a six months' trial to determine whether there is a public demand for such accommodations. There are 21 branches of state banks in Grand Rapids and they have been keeping open Wednesday and Saturday evenings. The newer ruling, however, applies only to the downtown offices.

Mr. Earle Defends Building Material Producers

(Continued from Page 10)

do not make the assertion) that you consider the railroads are responsible. In the first place, the railroads use more fuel than any producers I know of. The Pere Marquette uses 1,000,000 tons of coal annually, on which the freight rate has been increased, on account of the haul made by other carriers, in a sum approximating $500,000, and the cost of the coal at the mine has been increased from $1.05 a ton to $3.25 a ton—more than 200 per cent, equal to over $2,000,000 a year increase in the cost of coal. Another large expense on account of materials used by the railroad is in the cost of cross ties. In 1913 our ties cost us approximately 90 cents apiece in the track. Today they cost us about $2.25 in the track. We use 800,000 ties a year, so that the excess cost of our ties at this time is more than $1,000,000 over the cost of cross ties in 1913. This increase is just 150 per cent.

"The payroll for the Pere Marquette in 1920 was 220 per cent in excess of the payroll for 1917, with practically the same number of men at work. I do not take the time to go back to the rolls for 1917, so that while the freight rate was increased 127 per cent I am sure the labor rate on our railroad was increased quite as much.

"I have no doubt that the small per cent of increase in the cost of loading gravel is due to the advanced methods used in loading, as there have been a large number of high class plants built in Michigan for the handling of gravel since 1913.

"I would inquire of you as to what price you received for your gravel in 1913 and the price you received in 1920, and whether the freight is paid by your company or by the consignee. If you are loading gravel for 12 per cent more than the cost of loading in 1913 you should certainly be entitled to 12 per cent more a yard for your gravel now than you were getting in 1913, at the pit, providing the consumer pays the freight.

"The railroads were on the rocks in 1913, in Michigan, as you will know, and unless we are able to get away from the present conditions exacted through our agreements with labor, some of the roads will again doubtless find themselves in difficulty. I do not believe railroad officers want to penalize the public or the industries along their lines; and the Pere Marquette is interested in the success of the industries along its lines and would not want to exact a freight rate that would yield more than a reasonable profit upon the operation, based upon efficient and economical management.

"I wish it were possible for the public and the railroad to work closer. There is no reason why we should not work together always. Our interests are identical. When the shipper is prosperous, the railroad should be prosperous, and the railroads should not prosper beyond the shipper. It is a fact that the long haul through business can be handled at much lower rates than the short haul local business. In the former, the average movement of freight cars per day is as high as 50 miles, while in local business the average movement will not exceed 10 miles a day, on account of the time consumed in loading and unloading cars.

"The price of freight cars in 1913 was less than $1,000. It is now $3,000, or an increase of 200 per cent, and the charge as between railroads for the use of freight cars, as a rental, is $1 a day. The handling of local business on the Pere Marquette requires an average use of a car of 12 days per load handled. This means that for the rental of the use of the car alone the railroad company is obliged to pay $12. It makes no difference whether the railroad owns a car or rents it from another railroad. The charge of $1 a day no more than covers the interest on the investment, depreciation and upkeep of the car.

"You may think 12 days is a large average, but it is not when you consider that the shipper is entitled to two days free time at each end of the haul, and he usually consumes it, leaving but eight days for the railroad company to handle the business. The average car lings on gravel at the present rates are between $40 and $50 a car, of which 25 per cent is at once absorbed for the use of the car. On gravel from your plant located on our Fostoria branch, into Flint, the average earnings per car are about $40 and the time consumed in making the

Situation in Jackson Is Improving Steadily

It does not appear after talking with bankers and business men of Jackson that there is any pessimism in the hub of Jackson county. Business is coming back in a cautious and deliberate manner which is characteristic of that city's past performances. Bank deposits are still greater than at this time last year although totals are following the same gradual shrinkage shown throughout the country.

In labor circles there is rumor of a new outbreak between the Michigan Railway and its employes over the alleged discharge of the business agent of the carmen's union for his remarks about the one-man car policy of the company. The Michigan Railway has endeavored to continue service on the light traffic lines by using cars which do not eat up so much income, but the overzealous union men apparently believe that there is no appreciable relation between savings and expenses on such lines. Jackson has no association record of employment but parties consulted say many foreigners and former farm hands are making good.

A financial man in very close touch with Jackson's industries makes the following resume of some of the leading manufacturing companies' business prospects:

Briscoe: Gradually moving ahead but cramped because of production carried on during the depression.

Jackson Motor: Moving slowly.

Walcott Lathe: Prospects good but stationary at present.

Hayes Wheel: Has fair volume of orders and just starting operations.

Mott Wheel: Getting slowly on its feet following reorganization.

Reynolds Spring: Doing better. Prospects good.

Sparks Withington: Hurt by patent suit but other products going in good volume more than enough to offset any loss.

Jackson Fence: Doing fairly well.

Frost Gear & Machine: Marking time.

Knight Commutator Lighting Co.: Has done nice winter business. Plenty of orders.

Aspinwall Manufacturing Company (now Aspinwall-Dyer Company): Has raised new capital. Should improve soon.

Bayard Henry, George H. McFadden and Howard Hines have been re-elected directors of the Pennsylvania Railroad Company for four years. The stockholders have approved a proposed $100,000,000 increase in the company's indebtedness. The company's total gross revenues in January were $44,640,210, comparing with $52,596,067 in December and with $60,603,431 in October last year.

movement should be considerably less than 12 days.

"Conditions have changed for the railroads the same as for the individual. The Pere Marquette has 600 local stations in Michigan, most of which are small country towns where the trains leave early in the morning and return in the evening. The agent at each of these places, even if he has nothing to do in the daytime, must be paid from the time he goes on duty early in the morning until he serves the last train in the evening, regardless of how little work he has to do between trains, and for all the time he puts in beyond eight hours the company is obliged to pay him time and one half. At the end of these runs where it is necessary to have the engine watched during the night, in order to have the fire ready for starting out in the morning, the railroads have been required to pay the watchman at a very high rate on account of their classification as hostlers, and pay time and one half for the time put in beyond eight hours. In case an engine leaves a terminal in the morning at 7 o'clock and arrives there in the evening at 6 o'clock, so that it must lay over thirteen hours, it is cheaper for the company to hire two men rather than pay the one man for thirteen hours at time and one half after eight hours. For example: We had a case at the end of one of our branches where we were obliged to pay out over $350 a month to have the engine watched (please understand that the watching is nothing more than keeping the fire going so that the engine will be ready for use the next morning.) The amount paid out for watching the engine represents one-half of the income from passenger fares."

Replying to Mr. Alfred's letter, Mr. Earle said that he did not intend to convey the idea that the railroads were responsible for the high cost of building materials any more than the producers were.

"I wrote these letters for the purpose of getting the views of the different commissions, companies and individuals, so as to set our own minds right and do the same for the consumers. We expect that most of them will produce the responsibility of record, and the Flint Board of Commerce has already done so, but the Detroit Board of Commerce has notified me that it will give the matter consideration," wrote Mr. Earle.

"My personal belief is that one Samuel Gompers, assisted by Woodrow Wilson and the Adamson law, has contributed largely to the high cost of building material. In 1901 I predicted that if we kept on reducing passenger fares and freight rates, and increasing taxes and commissions, both national and state, for them to report to, thereby increasing overhead expenses and reducing income, some day we would have a bankrupt railroad system covering this country from the Atlantic to the Pacific. Well, we have it. So I predicted right.

"In 1913 we were selling gravel for an average of 75 cents a ton—that is, washed and screened material. Today we are getting 85 cents a ton. Of course you understand that when we sell our gravel we have diminished the value of our holdings, somewhat different than a mercantile proposition. The more gravel we ship, the more factories will be built and the greater will be your business. Who pays the freight? The consumer, eventually. The contractor pays it, but it is charged up in the contract on the work. We do think so much of our product goes to Flint only, a short haul at a good profitable rate, we think, that you might say to us now that the old arrangement agreed to, of five cents more, that the first zone rate, shall prevail to Detroit."

ACCOUNTANTS MEET IN DETROIT

Accountants from the mid-western states attended the regional convention of the American Institute of Accountants, in Hotel Statler, Detroit, April 4. Henry Steffens, Jr., city controller of Detroit, welcomed the delegates for the city and President Carl R. Nau responded for the institute. The principal topic of discussion was the federal income tax. The annual dinner was served in the evening, with Frederick C. Mosher, Detroit, as toastmaster.

Edward E. Gore, Illinois, spoke on "The Traditions of the Profession and Their Keeping." Archibald Broomfield, Detroit attorney, discussed "Some Recent Income Tax Decisions."

The profession of accountancy was organized first in 1887 as the American Association of Public Accountants. The first C. P. A. law was passed by the New York legislature in 1896. Now every state but one has such a law. The old association was merged into the present institute in 1896, which is closed to all accountants who cannot pass the required examination, the character of which is such as to prove the qualifications of all aspiring to a reputation as expert accountants. In Detroit there is estimated to be 1,000 public accountants, which includes principals, seniors and juniors, but only a few are members of the institute.

MICHIGAN QUARTZ SILICA CO.

The shareholders of the Michigan Quartz Silica Company, of Milwaukee, have just received a 5 per cent dividend, the third yearly payment since the company transferred its operations from the Michigan gold mine, west of Ishpeming. There are a good many shareholders in Marquette county. The report of the company shows assets of $131,152. The company owns the Michigan gold mine, which has been inactive for a number of years. Before moving to Wisconsin the company experimented with the treatment of quartz from the shaft, and while the best grade of silica was obtained, it was found that the transportation and other charges were much heavier than if a plant were established in Milwaukee. Edward Wehrle has been elected president and treasurer; Arthur E. Gross, vice-president, and Henry W. Pioss, secretary.

FOUNDRYMEN ORGANIZING

A meeting of the grey iron foundry men of the state was held in Lansing last week for the purpose of organizing an association to promote the standardization of foundry methods and practice and look after the other interests of the business. A committee was appointed with Chairman William H. Westwood, Lansing, to formulate the constitution and bylaws to be presented at the next meeting, in Grand Rapids, April 12. A. K. Hanchett, Big Rapids, was named secretary pending election of officers.

CRANE OPENS OWN OFFICE

Clyde C. Crane, who has been district manager in Detroit for the U. S. Gypsum Company, has opened an office at 400 Penobscot building and will handle building materials at wholesale. He will specialize in sewer pipe, tile, metal lath and a number of other lines.

THROWN OUT ON A TECHNICALITY

Because of the nature of the allegations embodied in the suit of the American House Wrecking Company against Henry and Edsel Ford and the Ford Motor Company to recover damages for abrogation of contract to dismantle the River Rouge naval training station, Judge Ormond F. Hunt, in Wayne Circuit Court, has dismissed the suit with the statement that the action should be tried in the court of law, not equity. The complainant company, according to the defendants, did not complete the contract within the specified time, whereupon the Ford company took over the work.

MANUFACTURERS MEET MAY 16

The annual convention of the National Association of Manufacturers will open in New York May 16, it was announced this week. Official representatives of more than 30 nations will attend the world social conference which is to be a feature of the convention. Charles E. Hughes, Secretary of State, will open this conference on the second day of the convention.

AERO SERVICE STARTS MAY 1

The Michigan Aero Service Company, recently organized, has leased 80 acres north of Lansing. This field will be equipped with a workshop and filling station. The company has received a consignment of 10 airplanes, which are being reconstructed to fit the needs of the corporation in its passenger and freight service. The company will start about May 1, doing a state-wide business.

COMPETITION has staged a notable come-back. No longer can easy, old-style methods of factory-operation permit your company to make profitable sales. Factory-management must share with sales-management the responsibility for sales-volume. Costs must be squeezed.

Take the single factory-management detail of material-handling.

Hand-truckage costs often prove *75% waste.* That in itself may give you the profit-margin you need against competition.

Let a Baker engineer dig out the facts in your plant and submit an economy-plan for moving your products and materials in and around your plant.

The saving quickly pays for the installation.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

Cut Prices? It Can't Be Done, Motor Car Manufacturers Declare

And Besides, They Say, It Wouldn't Do any Good; What Some of Them Have Written to This Paper

By MARC BRAUN

IF YOU have been putting off buying a motor car in the belief that prices are going to drop in the near future, you don't need to wait any longer. It does not seem likely, if makers and dealers are to be believed, that prices will be reduced soon. There may be a few isolated cases where manufacturers, for special reasons, may decide on a reduction before the summer is over, but taking the industry as a whole, such action would appear to be remote.

For some time the matter of prices has been much discussed in the trade and in the press, and, as is always the case, the views have varied. In one eastern financial newspaper, the claim was made that in order to bring a real improvement in the automobile business a reduction in prices was absolutely necessary. It was this article especially which prompted the Michigan Manufacturer and Financial Record to look into the matter rather closely. Some fifty representative manufacturers, distributors and dealers were asked for their opinions. The important facts brought out in this investigation may be summed up as follows:

1. The majority of manufacturers and distributors do not think there will be price reductions, although there may be a few makers who will do so.

Unwise at This Time

2. A price reduction at this time would not only be unwise but would not help the sale of automobiles.

3. It seems to be agreed that so long as prices of materials and labor are not considerably lowered, there can be no reduction in list prices, inasmuch as these two items are the most important to be taken into account.

It is evident that if sales had not increased during the last two months, prices of a majority of the motor cars, both passenger vehicles and trucks, would be lower than what they are. As a matter of fact, the writer was reliably informed that two well known concerns had new schedules all ready to be announced ten days after the closing of the Chicago show, last February, had the results of that show not been satisfactory. In the case of another manufacturer, it was said that a proposed price cut to go into effect last March was not put through because a majority of the dealers or distributors handling the car had reported such a satisfactory increase in sales and inquiries within a period of fifteen days that it was decided to delay the announcement. This concern, so the writer was informed, will now maintain its prices for the next six months at least.

One of the foremost parts makers in the country, when asked of his views because of his intimate knowledge of the situation, said: "A price reduction for 95 per cent of the motor car makers would be practically suicidal. They could not do so without seriously affecting their business, which, in many cases is now in none too good shape. If we were in January or February, the announcement of a reduction might be considered natural, because it could be said that it was intended as a stimulus for the season 'to begin soon.' Now, however, when the season is well under way, and after the success of the Detroit automobile show, and the success of most all the other shows, a cut could not have a wholesome effect. The public would be thinking at once that all automobile prices were so inflated that it would be best not to buy but to wait for further declines, and the result would be another and more serious slump. Another thing is that materials have not been reduced to a great extent, and while in some cases labor is lower, it is still very high—too high in many trades. This, however, does not necessarily mean that prices of all automobiles in the market are actually justified."

The purchasing agent of a Detroit company said: "We are increasing our production weekly; we are reducing our large stocks; our dealers are ordering more cars steadily; the general outlook is decidedly optimistic; yet all these favorable trends cannot be made the excuse for reducing prices, at least not during the present selling season. We, and every manufacturer, must figure that for months our sales were practically nil, that we lost money. A conservative business man will naturally conduct his enterprise along lines of safety and begin to replenish his stocks and start building up his reserves. If he were to cut his prices now, while we are still 'under the weather,' the chances are that there would be more people doubting his purpose and it would not increase his sales. Now is the time for all automobile manufacturers to display salesmanship; for the dealers to work hard and convince people that they are getting their money's worth and that general conditions do not warrant a price reduction."

The improved labor situation in Detroit may be taken as an argument that a price reduction is not needed to increase sales. Inasmuch as the greater percentage of the workers employed in the Detroit industries are in motor vehicle or parts manufacturing establishments, it is naturally upon the sales of vehicles that their employment depends. The report of the Employers Association for the week ended April 5 shows that 95,221 men were on the payrolls of the 79 concerns members of the Association. This is an increase of 28,000 within one month. And what is still better, of the 95,221 men employed, 85,677 are working full time. Only 30 days ago, out of 67,354 men working in these 79 plants, only 25,676 were on full time. There would be no such improvement in the employment situation if there were not a decided improvement in automobile sales. One depends upon the other.

Would Bring Demoralization

The distributor for one make of automobiles whose price has been the same for the last twelve months, and whose car has been selling steadily, said that if price cutting were inaugurated now by two or three of the larger makers it would surely lead to a demoralization of the industry. He believed that if a number of small concerns with rather limited output took such action it would pass almost unnoticed, but in the case of any of the well known larger producers, it would have a bad effect on the market. He said:

"The public would not understand it in the light in which it would be explained by the manufacturers. Last year, when price cutting was started, it did not result in increasing sales for most of those who did reduce their prices. On the contrary, it did more still further to reduce selling. It got prospective buyers skeptical. They got the impression that further cuts were to be made. It is obvious that if a manufacturer intends to reduce prices, he should do it before the selling season opens—for instance at the time he announces his models for the next year. But to do so in the midst of the selling season, just when sales are getting better, would be a decidedly wrong step.

"Of course, there are special cases to be considered. There may be manufacturers who still have so many unsold cars in stock that a price reduction is the only thing that possibly could help. But there is hardly a manufacturer who at this time could show that his labor bill, the cost of his materials and other expenses connected with manufacturing have been reduced to such an extent that a price reduction is warranted. Furthermore, with the possible exception of two or three makers, none has sold enough since the big slump of last year to allow him a fair profit. In fact, the increased sales now will only begin to help make up for some of the losses a great many makers have suffered during the last half year."

Digitized by Google

Some of the letters received from the manufacturers and distributors are given below.

W. C. Sills, general manager of sales, Chevrolet Motor Company, Flint—"In my opinion the reduction in price of a small amount would have been no inducement to get prospects to buy. Furthermore, it seems to me that price concessions of any large amount are not warranted by facts. First of all, the smaller production we have greater overhead per car. Secondly, up to this time there has been no great decrease in material costs. Personally, I do not anticipate any very heavy price reduction, if any, this coming season—certainly not until the price of steel and other basic materials is reduced considerably."

Percy Owen, president Liberty Motor Car Company, Detroit—"We believe there is no present reason justifying a reduction in the selling price of motor cars. You must remember that present prices are as low, and in many cases lower than they were last year when the volume of production was practically twice what it is today and afforded a better opportunity for the distribution of overhead. With decreased production, overhead costs per car have increased and we believe that many companies which reduced their prices may have to increase them. As a matter of fact, some increases have taken place since their reduction in price. The manufacturers found from last fall's experience that reduction in prices did not increase sales. As a matter of fact, it caused uncertainty and indecision on the part of prospects and greatly disturbed sales.

"While there may be some who may reduce prices, we feel that there will be a stiffening of prices and can see nothing at all in the trend of costs to justify decreases."

A. G. Selberding, general manager, Haynes Automobile Company, Kokomo, Ind.—"We do not believe there will be much change in the price of automobiles at this time. While there has been a slight reduction in the price of material, also some reduction in labor costs, yet a number of manufacturers are now getting started and in order to get one's cost of doing most any price for them, and how in the face of that fact prices can be lowered we do not know. Labor is the controlling factor, and if reductions cannot be made in labor, if materials are bound to go higher, and the first thing we know we will find prices soaring once more. The American people want lower prices but if we cannot reduce labor costs lower prices will be impossible.

"We may be wild on this proposition but this is as it looks to us, taking into consideration the troubles we have experienced with our labor after having cut it, and the further trouble that various automobile companies are creating by sending employment agents to Kokomo for the purpose of hiring men and offering them excessive rates."

H. G. Stiles, general sales manager, Kalamazoo Motors Corporation, Motor Truck Division, Kalamazoo—"In view of the wide variance of opinions as regards future price quotations, we would not care to go on record at this time with anything in the way of definite predictions, although of course we have our own ideas as to what we may expect. The betterment of business conditions which seems to be asserting itself at this time will unquestionably call for the use of a great many commercial vehicles, this demand increasing with the increase in general business. From what we have been able to learn, there is not an unusually large stock of finished trucks in the hands of the manufacturers and their distributors, and it will not take very long to wipe out this surplus and put back to work the idle trucks which are not being used at this time.

"When this occurs the factory will be called upon not only to take care of the normal demand but also to supply those buyers who held off making their purchases last year owing to general conditions, so that it sums itself up to the fact that the manufacturer will have to get into production very rapidly in order to fulfill the demand which he is going to find rather a difficult problem, as most of the organizations are pretty well broken up and new ones can not be put into operation at a moment's notice.

"This condition will go all the way along the line from the truck manufacturer to the unit builder on parts manufacturer and from him to the source of supply; so that even though one organization may find it easy to get started, another one back of it by virtue of the excessive demand may not find such an easy matter to get into full swing.

"Should all of this come about, it will necessarily mean that the manufacturer will work off his stock of high priced materials to a large extent, and gradually, through increased production all along the line, will be in a position to purchase materials at a somewhat lower figure, although it is our impression that reductions will be general, beginning from a material and labor standpoint, which should mean that no drastic steps will be taken by any reliable manufacturer, feeling, as they do, that the demand will equal their ability to supply.

"It is our impression that the price-cutting which has been going on has been brought about rather through an effort to liquidate speedily than for any natural reason or philanthropic ideas."

H. A. Biggs, vice-president, Studebaker Corporation, South Bend, Ind., and Detroit—"As you are aware, we made our reduction in prices last fall at a time that it was deemed advisable to do so in order to help the movement toward lower prices. We still consider that the manufacturers as did not reduce their prices at that time—and I am referring to the longer manufacturers that were in a position to purchase materials for some months to come—are now, or very shortly will be, in a position to reduce their prices. Beyond that I do not look for any reductions for some time to come."

J. M. Holt, secretary to R. C. Rueschaw, sales manager, Reo Motor Car Company, Lansing—"In the absence of both Mr. Rueschaw, sales manager, and P. E. Emerson, assistant sales manager, who are out of the city, we feel confident that the opinion that there is no reduction in sight at this time, and that price reductions would not increase business, is the opinion of this company.

F. D. Engle, sales manager, Transport Truck Company, Mount Pleasant—"We can see no reduction in the price situation on motor trucks for months. The reductions received from our suppliers have been very small and have been more than offset by decreased production. While it is true that orders for trucks have increased materially in the last thirty days, it is going to be impossible to get into normal production for a considerable time.

"It has come to our attention that nearly all, if not all truck manufacturers who reduced their prices last fall will be necessary to raise them again. This shows conclusively that they were unable to replace materials at the prices that warranted reductions. It is our opinion that we will not get into normal production until early in 1922. We do believe the crisis is past and business will gradually improve from now on."

A. C. Downing, sales manager, Detroit Electric Car Company, Detroit—"We do not look for any marked changes in prices of automobiles during the next eight or nine months. There may be a few concerns who will make some change after their guarantee runs out, but if their car was honestly priced last fall and they were warranted in making the guarantee, we do not know of any great changes that have taken place to warrant further reductions next July.

"We know that some of the concerns who materially reduced their prices last fall have made an addition to their prices since that time, thus showing a tendency toward price stability.

At the present time our car is just 23 1-3 per cent in advance of the prices during 1913 and 1914 on exactly the same car. We know that the costs of labor and material, rent and other fixed expenses are more than 33 1-3 per cent over the prices of the same materials in 1913 and 1914. Therefore we figure our cars honestly priced and cannot make any changes in the list prices."

A. S. More, president and general manager, Denby Motor Truck Company, Detroit—"It is our opinion that the next few weeks will see a reduction in price of steel announced by the United States Steel Corporation and that this announced reduction, together with the lower wages now being paid labor all along the line, will bring about lower selling prices on automobiles and trucks.

"The financial economists, such as Poor, Moody, Babson and Brookmire, all agree that steel is one of the last commodities to deflate, but that it is bound to be lower without much greater delay. The trade all along the line is expecting a reduction in steel, and until it does come, buying of iron and steel products is going to be greatly retarded.

"From our point of view, we don't know of a single thing which would revive truck business more than an announcement of a substantial reduction in steel, which would be passed along down the line, eventually reaching the ultimate buyer, who would thereupon show more interest in making the purchases he has long deferred."

W. D. Block, president, W. D. Block Motor Company, Detroit, distributor for the Laxington car—"Will say that I see no reason why there is no question in my mind but what the prices of automobiles must be adjusted and they must be adjusted at once. In my early state, as public sentiment is inclined that way, and it would be impossible for the industry to buck that sentiment for an indefinite period.

"I have given this question in the writer's mind but what a price decline or a price adjustment would tend more to stabilize the automobile industry than any other one thing.

"I have just returned from several of the National automobile shows and also attended a good many of the dealers' shows, and invariably the question of price has entered into the proposition, with the dealer also asking when the price was coming down and saying that his purchase would be delayed until some adjustment was made. In fact, some were as frank as to say that if they purchased a car at this time they would simply be encouraging the manufacturer to withhold any adjustment in price.

"The writer has been at several of the National automobile shows and also attended a good many of the dealers' shows, and invariably the question of price has entered into the proposition, with the dealer also asking when the price was coming down and saying that his purchase would be delayed until some adjustment was made. In fact, some were as frank as to say that if they purchased a car at this time they would simply be encouraging the manufacturer to withhold any adjustment in price.

"You undoubtedly are aware that most dealers all over the country are making long trades on used cars and some are even going so far as to cut their profit to secure customers. I know of several organizations that have instructed their salesmen not to pass up any reasonable deal. Practices of this kind, in my opinion, are going to demoralize the retail market. It is putting our business methods back to where we were some seven or eight years ago when everybody was cutting the other fellow's throat, so to speak, on the price proposition.

"There is no question in my mind but what some factories are giving a confidential discount or bonus to most of their large distributors, and they, in turn, are using this bonus or extra discount in trade allowances. To my way of thinking it would be much better if the factories would establish a new list price and cars be sold at that price, allowances on used cars being made at the market value. This would give the distributor and manufacturer the benefit of the business and the customer would not be led to believe that he was buying a car at a fixed list price and kid himself into believing he was a good buyer because the dealer made him a fabulous price on his used car.

"I am a firm believer in selling merchandise at the price which factories establish, believing that they have so fixed the price that is fair and enables them to make their share of the profit and that the purchaser is getting value received. We also discourage the prac-

Squeezing Out the Salt Water

Business Interests Along the Great Lakes, Meeting in Detroit, Draft Amendments to the Seamen's Law

By F. W. HERSEY

PORT and hinterland communities on the Great Lakes have had the advantages of lake transportation for pleasure and commerce for so many years that the possibility of its elimination by legislation, rate warfare or organized labor's impositions never has occurred to them. Consequently when the LaFollette Seaman's Act, framed and enacted into law to promote safety at sea and improve the working conditions of crews, was before the national legislators prior to its passage in 1915 the fight against its provisions by the vessel owners, if noticed at all, was not considered of any concern to the lake ports and communities. If there was any thought regarding it at all, it followed the theory that the ship owners would have to accept less revenue, or perhaps might increase revenues in some manner.

Of course, the economic theory behind water transportation is that it is cheaper—must be cheaper to compete with rail facilities—and the theory has been tantamount to practice. The lake transportation facilities provided are such a boon to lake ports and territories adjacent that the rapid development of Michigan as a manufacturing state as well as agricultural has been stimulated and encouraged. The transportation on the lakes has been sufficient to show the value, in fact the necessity, of an all-water route to the ocean.

A Crisis Arrives

Following the passage of the LaFollette act the whole country entered a new era of production with swollen profits and unlimited demand. The requirements of war removed from the lakes many of the ships, leaving those not commandeered in possession of all the commerce with demand exceeding supply. Rates in effect and cargo volume to a certain extent overcame for the time being much of the hardships by the seamen's law.

We have come now to a new era demanding an accounting of extravagances and the introduction of economies. With rail rates the highest in history, water travel and commerce becomes even more important as one salvation for indnstry, to say nothing of its value as a recreational medium for that portion of the population not in a position to select its recreation regardless of costs. Besides being less expensive, lake travel is less hazardous, can be regulated to suit the time restrictions set by him who travels, and in every way is more convenient.

Had the lake communities realized all this consciously, and had they been awakened to the menace to lake shipping contained in the provisions of the seamen's act when it was proposed, the conference held in the Detroit Board of Commerce, Friday and Saturday of last week, would have been held in 1915, and it is likely that the bill would have been greatly altered. Instead of the "vested interests" stigma cast upon the efforts of the ship owners, the legislators would have heard from the Middle West—and they would have listened.

Possibly it may seem like locking up the barn after the horse is stolen to begin a campaign against the LaFollette act at this late hour, but very likely in effect the horse will be captured and returned so far as the lakes are concerned. If such is not the case it will not be the fault of the Detroit Board of Commerce and the workers in its Inland Waterways Committee.

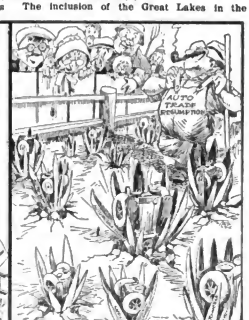
The port and hinterland communities, having come to their senses as the result of the successive withdrawals of vessels from lake routes—vessels which have traversed these waters for years, are now uniting with the vessel owners in spirit, and are prepared to go to Washington on their own accord and responsibility and ask that the Great Lakes be eliminated from the drastic provisions of what was intended to be, and is by all the rules of legislative technique, a salt water measure and nothing else. The vessel owners are in the gallery in this case. They did their best and failed. Cheaper transportation and ship building as an important likeside industry are at stake.

There is no quarrel with ship owners, legislators or the unions. The problem is economic. The question is: Will Congress permit an act upon the statute books to deprive the Middle West lake region of its water-borne commerce because a few "landlubbers" of a former governmental regime did not know the difference between salt water and fresh water sailing?

Where the Trouble Lies

The cause of the present agitation is contained in three sections of the LaFollette act, Nos. 2, 13 and 14, the provisions of which may or may not be justifiable when applied to deep sea sailing. There is no argument about that. Their application to lake shipping was regarded by the conference as not only ruinous to the shipping but ridiculous in some cases.

For instance, Section 2 as it stands requires that every ship of more than 100 tons gross, operating on all waters except bays, sounds and rivers, shall maintain two deck and three fireroom watches; that no seamen shipped for deck duty shall be sent into the fireroom, stokehold or engine room for duty, and no engine or fireroom crewmen shall be assigned to duty on deck. The main reason why this law was approved by the legislators was to prevent the assignment of men who had been working in the heat of the fireroom and stokehold to deck duty with the danger of their becoming chilled by the change from extreme heat to cold, and to force ship owners to employ enough men properly to man the vessels without subjecting them to unreasonable hours and conditions of labor.



The inclusion of the Great Lakes in the

waters subject to these requirements gave the unions a chance to provide jobs for more than ordinarily would be required for the short runs and small boats on the lakes. The section specified that the authority of the master was not to be limited, and in case of emergency he could muster his whole crew at any station where their services were most needed for the management of the ship.

How this provision worked in one case on the Great Lakes is illustrated by an experience described by H. H. Vaughan, of the Charcoal Iron Company of America, in a letter to the conference. This company operates a 1,500-ton boat on the lakes. When loaded this craft has a gross tonnage of from 2,400 to 2,500 tons and carries a crew of eighteen men. Its fireroom is equipped with gravity stokers which dump the coal upon the fireroom floor, whence it is shovelled into the fire boxes by the firemen. This equipment obviates the necessity of coal passers. Section 2 of the law, however, makes it obligatory on the company to employ three coal passers. Firemen cannot pass coal, neither can deck hands, according to union rules.

As there is not enough room in the fireroom for the three coal passers and there is no work for them to do, the company has been carrying them as "supercargo," paying the required wages and feeding them, season after season. It provides a soft snap for three able-bodied men, who naturally appreciate their union cards.

On one occasion when the master shipped more coal than could be stowed in the bunkers, part of it was piled on deck. As the bunker charge decreased, the stokers were asked to shovel the coal from deck to bunker. They refused on the grounds that they were firemen hands and could not do deck work. The fireroom hands refused to touch the coal because they were not deck hands, and the deck hands refused because they were not stokers, or firemen. The captain and mate shovelled the coal into the bunkers themselves.

H. W. Thorpe, of the Goodrich Transit Company, delegate to the conference, told of an occasion when one of his company's ships went ashore a few miles from Chicago. It was necessary to use the pumps to keep the hold dry. When the ship docked the fireroom crew demanded $1.25 an hour extra for furnishing power to the pumps.

Why Kirby Was Taken Off

Ollie Dustin, who was forced to take his ship, the Frank E. Kirby, off the Put-in-Bay and Island runs in 1920, said he did so because in 1919 the boat showed a loss of $9,000, which he attributed entirely to the seamen's law. In 1911 and 1913, he said, the boat grossed $19,000 less than in 1919 and the profit was $9,000, while in 1919 with $19,000 more in gross revenue, the loss was $9,000. Prior to the passage of the law the boat operated with four men in the fireroom, but after the passage of the law, ten were required. In the meantime wages and fuel costs had been increasing steadily. As they could not be met even nearly enough for his concern to break even, he was obliged to lay the boat up and she was for sale to anyone who believed she could be operated at a profit.

L. E. Williams, marine manager of the United Fuel & Supply Company, Detroit, said that his company's sand and gravel boats were required to carry three firemen to shovel for a seven-hour run, of which only three hours were spent between ports.

John Wise, Sandusky, another delegate, said that he operated a steamer to Put-in-Bay, a run of 2½ hours, with four stops, but was obliged to carry three firemen to shovel the six tons of coal necessary on the run.

These are only a few of the experiences recounted by delegates at the conference, but they suffice to show how the present law affects Great Lakes shipping. It should be mentioned here that the bulk freighters are not so seriously affected by the provisions of the law because of the character of their cargoes and the length of their runs.

Section 13 of the LaFollette law applies to the employment of seamen. It provides that all boats of more than 100 gross tons shall have a crew in which 65 per cent consists of able seamen. It further provides that an able seaman must have had three years' service at sea or on the Great Lakes, besides being at the least nineteen years old and physically qualified, but on the Great Lakes the requirements for an able seaman's rating is eighteen months' service, or three seasons, according to lake schedules. Where the applicant is a graduate from a schoolship, only twelve months' service is required, other conditions and qualifications being equal.

This section is a hardship to lake carriers in two ways, one of which is the fact that able seamen are not always easy to get, and inasmuch as the law specifies that no ship may leave port without the required quota of able seamen, the desertion, discharge or absence of one or more members of the crew with such ratings can and often does delay sailing. It also affects the ship owners' choice of their seamen and the unions. The second effect of this provision will be shown later.

Were the sailing conditions on the Great Lakes in any way similar to those at sea, the provisions of the law regarding able seamen would not be so harmful. So many small boats make short runs in shallow water, carrying excursion parties, or doing a passenger and package carrying business, that the necessity of having a majority crew of able seamen required, no other purpose than to give sea labor organizations power to use the manner in which the owner of the packet shall conduct his business and provide jobs.

It is under the provisions of Section 14, however, that the able seamen quota requirements works its greatest hardship on lake carriers. Section 14 prescribes the character and amount of life saving equipment to be carried. It is doubtful if the lawmakers had as much about the Great Lakes when they let this section go through. It was intended primarily for the protection of ocean liners where accidents of any magnitude not only imperil lives, but where the fight to save life may require living in open boats or on rafts for days at a time.

The section requires that boats of 100 gross tons or more shall carry life boats for at least 75 per cent of the passengers and crew, and that not more than 25 of these ships operate twenty or more nautical miles offshore. Ships sailing less than twenty nautical miles from shore must, between May 15 and September 15, have provision for 70 per cent of crew and passengers, and fifty per cent of these facilities must be life boats and the remainder life rafts.

What the owners of small excursion boats and freight-carrying craft object to in this section is the requirement that between September 15 and May 15 these boats operating three or more miles from shore shall carry seventy-five per cent life boats and twenty-five per cent rafts, whether or not these boats sail waters deep enough to cover all the decks. The effect of this provision is to shorten the summer season by from a month to six weeks on the lakes. It was pointed out in the conference that most of these boats sail in shallow water where if they sank at least one deck would be entirely out of water.

This section also requires that one or more able seamen must be assigned to every life boat and raft, according to the number of persons accommodated in the boat or on the raft. Consequently lake boats must carry enough seamen to man all the life boats and rafts whether there is any other work to be performed by them or not. As shown by deliegates, few of the lake boats have any need for the number of able seamen called for by this boat and raft provision, so that to comply with them in all respects many of the boats are carrying seamen for whom there can be no employment unless an emergency drives passengers and crew off the boat. Licensed officers are not permitted to act as able seamen in this capacity; in fact, under the section, they are not able seamen although the safety of boat, cargo and passengers is entrusted to their care.

A. A. Schantz, of the D. & C. Navigation Company, who pulled his Mackinac Island boats off because they were losing money, declared that if his boats carried the required number of life boats and rafts there would be no room for either passengers or cargo; in fact his boats could not carry this equipment as freight if every available inch of room was taken up. If they were towed, he said, when his Put-in-Bay boat reached the destination, the last life boat would be leaving Detroit. In lake waters, he said, the life rafts were better than boats because they could be kicked off and handled easily by the passengers. With wireless equipment and boats passing every four minutes in the lake season, if a boat foundered or burned, passengers would not be floating about longer than fifteen minutes.

The Objections Summed Up

Summed up, the objections to the three sections as voiced in the conference were based upon these disadvantages: The unnecessary expense of three watches in the fireroom where the working hours were much less than sixteen hours and less than nine hours in most cases; the difficulty of being able to ship able seamen whenever needed, and the absence of any need for able seamen to the extent required in lake navigation; the shortening of the navigation season and the added expense resulting from the drastic life boat and raft requirements, all of which resulted in cutting revenue and increasing expense.

To draft proposed amendments which would modify these sections for lake navigation only was the purpose for which the conference was called. It was successful in every way. It was called at a most opportune time, the details were well prepared and the sessions ably conducted. Delegates, or boards of them, were more than 100, came from almost every lake port and commercial association of the lake territory from Duluth to Buffalo. It was a meeting for producers, manufacturers, shippers and ship builders. Vessel owners and transportation companies were represented merely to provide information concerning the effects of the law.

The conference closed Saturday with the stage set for the presentation of resolutions urging amendments to the LaFollette act, to the legislatures of all the lake states; presentation of the same resolutions to congressmen and senators from the lake districts, and the submission to Congress of a set of amendments prepared by the Detroit Board of Commerce, revised and approved by the conference committee on amendments, and approved by the conference. Also the conference left with the Board of Commerce authority to send one or more representatives to Washington with the amendments, and later arrange for a delegation to go to the capital to attend the hearings on them.

The efforts of one delegate from Buffalo to have embodied in the draft a provision decreasing the time of service necessary for rating as able seaman to twelve months for the sea and six months for the lakes created the only difference of opinion, and as the delegate was practically alone in his contention the amendments as prepared were approved. It was the opinion of the conference that the law as a whole contained many just and wise provisions, and that all the lake territory could or would ask was that these sections which were driving shipping from the lakes be modified.

Section 2 was amended to read that only two watches be required on Great Lakes vessels where the runs were less than sixteen hours or

Boring Mill Operation

Something About These Descendents of the Lathe And Work They Perform; Considerations in Buying

The photograph at the left shows the operation of boring the rear head for an automatic twist drill machine. These holes are 5½ inch diameter by 11 inches deep; 2½ inches diameter by 6 inches deep, and 2 inches diameter by 6 inches deep, the nine holes being finished complete in ten hours. The limits required are extremely close. The photograph was taken in the plant of Schweppe & Wilke, Detroit. At the right a water jacketed, rigid, journal box, babbit lined, is being bored. The finished bore is 2 15/16 inches, with a 3 3/16 inch counterbore. The limit of accuracy is .0005 inch. Fifteen pieces are finished daily. The photograph was made in the plant of the American Blower Company, Detroit. Photographs by courtesy of the Charles A. Strelinger Company. The machine in each case is a Universal.

By JOHN J. RALPH

THE ORIGIN of boring machines dates back to about the first of the last century. James Watt and his steam engine tronhlem were the direct cause of boring machine development. His first cylinder was only fifteen inches in in diameter but it was more than three-eighths of an inch out of round! He even tried stuffing it with an old hat to make it tight. There were others interested in steam engines and it was not long before a boring machine was brought out.

The boring machines are direct descendents of the lathe—in fact the lathe today is very frequently used for a boring machine, more so on the other side than here.

Boring on a Lathe

Boring on a lathe is done in two ways, the one chosen depending on the size of the lathe, the size of the piece and kind of boring to be done. The first, and more familiar way in this country, is to bolt the piece to the face plate, if it is large, or hold it in the chuck if it is small. The boring bar is then put in the tool post and the hole is bored. Here the work turns and the tool is stationary as in outside turning. The second way is to take off the compound rest slide and bolt the piece to be machined to the saddle. Practically all of the larger lathes and some of the smaller ones have Tee slots in the saddle for this purpose.

A bar is placed between centers and driven by a dog from the head-stock face plate. For small work a tool is placed in the bar and provision is made for radial adjustment so that the position of the point can be changed at will to regulate the diameter of the hole to be bored. Where the diameter of the hole to be machined is large, the tool is mounted on an arm with a slide which permits of radial adjustment. Lengthwise feeding is done with the saddle.

With this apparatus the length of hole that can be bored in the lathe is somewhat less than half the distance between the centers, and if the lathe is not long enough another arrangement is necessary. The piece is set up the same way but the saddle is locked in place and the tool is fed along the bar.

Present day machines are merely developments of these ways of boring in the lathe. The chucking or face plate method has developed into the boring mill and the vertical turret lathe. The bar method has developed into several distinct types of horizontal machines.

Practically all boring machines belong to the "heavy" class, for articles light enough to be moved easily by hand are usually machined in ordinary lathes or in horizontal turret lathes of either the automatic or semi-automatic types.

With the increase of machining and the resulting specialization of tools, these various machines have gradually been made more special, and at the same time the range of work that could be done on them has been increased.

The boring mill and turret lathe have added turning, both straight and taper, facing, and even screw cutting. They have been arranged so that a whole series of tools can cut at the same time. The horizontal machines have developed by adding to themselves the functions of the drill press and the milling machine.

The Face Plate or Chucking Machines

The face plate or chucking machines are used for machining pieces which are broad and short rather than long and slender, both for boring, turning and facing.

At first when shops were small and every machine in it had to be used for everything that could possibly be done on it, the only chucking or face plate machine was the lathe. Gaps were made in the bed and the head stock was mounted on raising blocks to admit pieces of large diameters.

The next step was a lathe with the tail stock end cut off. The head stock was mounted on one foundation. In front of this a pit was dug in which an enormous face plate was hung. The cross slide was placed on a foundation in front of that. There was no tail stock. There are still some lathes of this type to be found in the old shops. They were satisfactory while cuts were light, when time was not so costly as it is now, and present day close machining limits were not required.

There was difficulty in balancing the castings. If they were not balance the rotating speed varied, resulting in uneven and inaccurate cutting and broken tools. The weight of the enormous castings hanging on the face plate and projecting several feet made it almost impossible to maintain accuracy and was very hard on hearings and drive.

The Boring Mill

This forced the development of the vertical boring mill in which the spindle was vertical and the face plate was no longer merely a part to bolt the work to, but, in the larger size, aided the support of the piece, being partially supported on annular bearings. The drive was also transferred to the face plate, which now became known as the table. From the planer was borrowed the method of support of the tools, double housings supported a cross rail from which tools heads depended, somewhat like the planer tool bead but simplified because no provision need be made for the non-cutting return stroke.

In the large modern machines the housing is mounted on rails which extend the range of the machine materially. Out-board tool posts are also used, so increasing the number of tools which can be used at one time and the range of the work that can be done.

As cutting speeds became higher and the demand for accurate work more exacting, the inaccuracies due to unbalanced work on horizontal spindle machines became more and more noticeable. This resulted in the putting on the market of smaller boring mills and finally the development of the vertical turret lathe.

The features of the side bead boring mill are the same as those of the vertical boring mill, the difference being in the use of a column instead of a planer housing to support the cross rail. To it there has been added a turret on the cross slide and a vertical slide

Digitized by Google

which permits of another tool head. With this arrangement it is possible to machine both inside and outside at the same time and to make all of the cuts on many complicated pieces with but one setting of the tools.

This type of machine finds a wide use in machining flywheels, motor truck wheels of the solid type, railway wheels and a large number of other similarly shaped parts formerly machined in lathes. They are made today in a size range from 24 inches to 64 inches.

The first of the horizontal boring machines to be perfected was the cylinder boring machine. This consists of two supports at each end of a bar. Between them is an iron head and foundation plate. There is no provision for changing the height of the bar, nor for raising the floor plate. One of these supports carries the feed and the power drive. The bar carries an arm which in turn holds the cutting tool. Several sizes of bars can be used, bushings being inserted in the bearings to accommodate the small bars.

Large steam engine, pump, gas engine and refrigerating machine cylinders are usually machined on this type of tool. Those made especially for locomotive work often have two spindles, one to machine the cylinder and one for the pistons.

In boring long cylinders it has sometimes been necessary to make provision to avoid effect of the bending of the bar, supported on both ends although it is. As the cutting tool starts near one head and finishes up near the other, the bore will follow the curve of the bar. While this is usually slight, with a light bar it may be noticeable.

In order to face up the ends of the cylinders square with the bore, radial arms are placed on the bar with radial feeds connected to each head. These are fed by means of a screw actuated by a star wheel.

The Horizontal Boring Machine

The horizontal boring machine is the machine that looks most like a lathe of all of them. Not long after it was first got out, the manufacturers realized that these machines was set up for any particular piece the tool might just as well do a lot of other things, so provision was made to do it. Today it is known as the horizontal boring, drilling and milling machine.

It has a heavy solid foundation, on one end of which is the column head which carries the boring bar. Unlike the head of a lathe, this one can be moved up and down. At the other end of the bed there is another column, known as the back rest. This carries a bearing to support the outer end of the boring bar.

The spindle has a long support in the driving head and is often used, when boring, without further support. For face milling the cutter is fastened directly to the end of the spindle. A cross rail can be bolted to the head and tall column and forms a support for a milling cutter which is used to machine flat surfaces on top of castings instead of planing them.

On the bed there is a table with power movement, both along the bed and across it, similar to that of a carriage and tool slide of a lathe. The carriage, however, is much larger and stiffer and has a top with Tees for bolting the parts to. Very often a circular turntable is mounted on this table. Where this is done all of the boring, drilling and reaming parallel to and all the milling perpendicular to the base surface can be done at one setting with a material increase of accuracy.

There is still another type where the head is fixed in position and the table is elevated, being supported on screws.

In both of these types there is power drive of the spindle, the work is held fixed in position and the bar is fed in and out. Ordinarily, only comparatively small work is bored on them—that is cylinders up to, say, three feet in diameter and three feet long. Larger work can be done but where there is much of it a cylinder boring machine is usually purchased.

The moveable column horizontal boring machine is very similar to the horizontal boring machines just described, in that the driving head is moved up and down the column and there is an outer column used for supporting the boring bar. Instead of having a moveable table on a bed the entire column is set on ways and is moved by power in front of the stationary work.

This movement is added to give rapidity and range in setting the machine for the different operations of drilling, tapping and milling as well as boring. The drive giving the column movement should be sufficiently strong so that very heavy milling can be done with a face mill. With large pieces this saves much awkward planer and setting work.

The entire line of horizontal boring, drilling and milling machines is very versatile. They are applicable for work from the size just too heavy to be handled easily by hand, up to the very largest. The problem of jigs does not enter as much as in most lines of work, because of the large average size. They are used, of course, but it is seldom that large work is built in large quantities and the economy of jigs decreases with the number of pieces of a kind made and also with the size of the jig.

As in all cases where there is little or no jigging, the auxiliary tool equipment to be used with machine tools is an item of importance. There should be a sufficient supply of bolts, jacks and other holding devices so that the mechanic will not be tempted to slight the fastening.

There is no appliance which will be of more assistance in increasing the output of the horizontal boring machine than the circular turntable. This is mounted on the base table and with its aid all parts of the casting can be worked on at one setting. If the table is kept in shape and the graduations are accurate, this fact will save many hours of setting up time even where the size is moderate..

The handling service for machines of this size is the speed limiting factor in many plants. For the larger machines the overhead electric crane is the only possible answer. With the smaller machines, more likely to be on production work, it is equally costly to have insufficient, slow or poorly placed transport service.

Too often the hand power chain hoist is the only means of moving pieces on and off the mill. There are few plants where electric or air hoist service, on substantial jib cranes would not be a big profit producer. A machine coats as much when idle as when busy. Adequate crane service turns idle time into production time.

Automobile Cylinder Boring Machine

The automobile cylinder boring machine is one of the latest developments of the machine tool line and is a descendent of the drill press rather than of the lathe. In these machines there are horizontal tables with vertical spindles over them. These revolve, carrying the cutting tools, and are fed into the cylinders. For shops with small production they are simple, the cylinders first being rough bored and later reamed on the same machine.

Where the production is large there is an elaborate machine having a circular horizontal table with several stages and a series of jigs. The cylinder is placed in its jig at Station 1. It is then carried under the first set of spindles at 2 where it is rough bored. Another cylinder is now put in at the loading stage. At the same time a cylinder which had already

Growing Two Bonds Where One Grew Before

THE BUSINESS of selling bonds is one that has always seemed to stand on an unusually high plane as a calling in life. It represents in many ways the acme of fiduciary relations and is one in which no temporary foundation of service will suffice. It is one also wherein liability to serve continues until the last maturity is called in and paid.

I have always been impressed with the promptitude with which several houses have taken up defaulted issues at various times when in point of legal liability it was unnecessary. But the sense of moral responsibility in these instances has been so deeply appreciated that the bond houses concerned have not waited for a possible prod of legal enforcement.

Again, the thought comes to mind that it is a business wherein the elements of physical effort and mental alertness are nicely combined, for neither knowledge without constant effort, nor effort without knowledge, count for much. A real bond salesman is both student and athlete. And looking further into the membership requirements there is a long period of apprenticeship much like that a young doctor goes through with; so that a prospective bond man must come and go and hold an almost unholy love for the game, so to speak, in order to outinst the discouragements and heavy-going he encounters during his apprenticeship.

As I look back there comes to mind an incident in my own experience which illustrates the point about discouragements and heavy-going. After my third year in college I took a position with a bond house as a salesman and my first trip out was to Omaha. I had been told that Omaha, at that time, was a great market for mortgages but that it was a virgin field for bonds. So I dug up a couple of prospects and walked in on the executor of a large estate who was known to be a heavy mortgage buyer. I had learned the contents of my circular so well that I could repeat it forward or backward, and after preliminaries were over started in to sell the executor a block of the bonds in question. He listened patiently and I talked on glibly, gaining a confident feeling as I went on that he was just about to take on the entire issue. But great was my dismay, when I paused for breath, to hear him say, "It is surely very kind of you to come way out here with this proposition but we get all our bonds from the American Surety Company."

That man didn't know an investment bond from a surety bond, and I believe that even today, in spite of Liberty bond drives and all the publicity which has been given the bond form of investment, there are many more like this executor who can be converted.

Another class of purchasers which it seems is being overlooked is the foreign element in Detroit. There was upwards of a million dollars in the hands of the Italians, Poles and Greeks over in the East Side of Detroit about a year ago. While this fund may have

Changing Over to Electricity

The Detroit Copper and Brass Rolling Mills Expect To Effect Notable Economies and Improve Products

Above is shown a battery of six Detroit Electric Rocking Furnaces for brass smelting recently installed in the casting shop of the new manufacturing building of the Detroit Copper & Brass Rolling Mills. Each of these furnaces has a maximum capacity of 2,500 pounds to the heat, against 200 pounds for the crucible which they replaced. At the left, a "close up" of one furnace, showing mold table in position, with molds set for bar brass. At the right, section of the brass sheet and strip rolling equipment, showing the application of electric motors to the dual rolls.

IN KEEPING with the spirit of the hour—increased production at lower costs—the Detroit Copper & Brass Rolling Mills plant equipment is being electrified, the result of which will be, according to the expectations of Alex Henderson, works manager, a saving of at least 30 per cent in power costs and an increase in productive power of 50 per cent. In addition to these advantages, it is believed the substitution of electric power for steam will increase working space, make a cleaner plant and greatly improve working conditions. Likewise the reduction in the number of men necessary will effect a saving.

The installation of Westinghouse, Allis-Chalmers and General Electric motors has been going on for months and will continue until the equipment is complete. At present approximately 12,000 horsepower in electric motors has been installed in the tube, brass and copper wire, sheet and strip brass mills and the melting and casting shop. The sheet copper mill is being equipped at present.

The copper and brass rolling mills of the Detroit concern are the oldest in this territory. During the war these mills earned the reputation of being able to roll the largest brass sheets of any plant in the United States. Eighty per cent of the condensor plates used by the Emergency Fleet Corporation were rolled in these mills, some of them rolled from 4,600-pound brass billets into sheets an inch and a quarter thick and 12 feet in diameter.

Electric Furnaces Installed

Even the uninformed layman who was familiar with the general appearance of the mills as they were before and during the war would realize on a second visit that something revolutionary had taken place. Only one new mill has been built recently, but the transformation in the older buildings has been so marked as to give one the impression that they are all new. The sheet and strip brass rolling mill is a new unit in every respect. It is 625 feet long and 50 feet wide, built of concrete and steel, with three bays. Overhead there is a sawtooth roof and under foot a Creolite (cedar block) flooring. Its wide area of glass is set in Fenestra sash, providing all the light possible.

At one end of the building is the melting and casting shop, and it is in this shop that the greatest increasing in productive power and decrease in production costs will be accomplished. The old crucible pits in which the numerous 200-pound crucibles turned out their quota of metal for so many years have been covered, and in their place stands a battery of six Detroit Electric Rocking furnaces, occupying only 270 square feet of space, where the crucible equipment covered 10 times as much. Two more furnaces are to be added later which will further increase the tonnage.

Each of these furnaces has a capacity of 2,000 pounds of yellow brass, as rated, but can be loaded up to 3,000 pounds at a heating. With a 2,000-pound load the electric energy required is 225 kilowatt hours. The costs a ton have been estimated as follows: Electric energy, 225 kilowatt hours at one cent, $2.25; refractories, 50 cents; electrodes, 63 cents; labor, $1.42; incidentals, 50 cents; interest and depreciation, 43 cents; total, $5.48 per ton melting cost. The number of pounds of electrode per ton of metal melted is estimated at from 2½ to 3½.

Where the loss of metal by oxidization and other conditions in the crucible process has been from 2½ to 5 per cent, the company expects to show no greater loss by the use of the electric furnaces than from ½ to 1 per cent, which, added to the cost of coke, extra labor and ash disposal, will mean a saving of from $10 to $20 on a ton of metal. Forty minutes is the time allowed for one heat for a ton of metal, as against a time allowance of from two and one-half to four hours for a 400-pound crucible. The maximum life of a furnace lining is set at 1,200 heats. With the complete set of eight furnaces the possible daily production of the plant, in yellow brass, extrusion billets and flat bars, has been estimated as high as 360,000 pounds, although this is regarded as a little high. Running 10 hours a day under ordinary conditions, the furnaces would turn out 250,000 poonds, with an increase of 60,000 pounds at a 2,500-pound loading per furnace.

Where another important saving both in time and money will be made is in the charging of the furnaces. This work will be done by the five-ton Shaw electric crane installed in this shop. It will be possible to lift the scrap to the deck over the furnaces and dump it into the hoppers above them with comparatively little labor. Storage for coke and ashes, with the necessary handling labor for both, is elim-

R. H. Collins Joins Durant

President and General Manager of Cadillac Resigns to Resume Connection With Old Chief

RICHARD H. COLLINS, president and general manager of the Cadillac Motor Car Company, Detroit, since 1917, has resigned to become associated with William C. Durant, former president of the General Motors Corporation, in his new enterprise, the Durant Motors, Inc. The precise position Mr. Collins will occupy is not announced, but it will be one of responsibility, as indicated by the hint that it is to be a "commanding position." Through all his years of labor in the automotive industry Mr. Collins has built up and continually strengthened his reputation as an executive of high caliber.

Since Durant, himself a dynamic builder and executive, first "discovered" Dick Collins in Kansas City fourteen years ago, when he was drumming up business for farm implements, Mr. Collins has been one of the "right bowers"

R. H. COLLINS

of the creator of the General Motors Corporation. It is only natural then that Mr. Durant, a successful picker of men, should seek the services and counsel of his protege in his new venture.

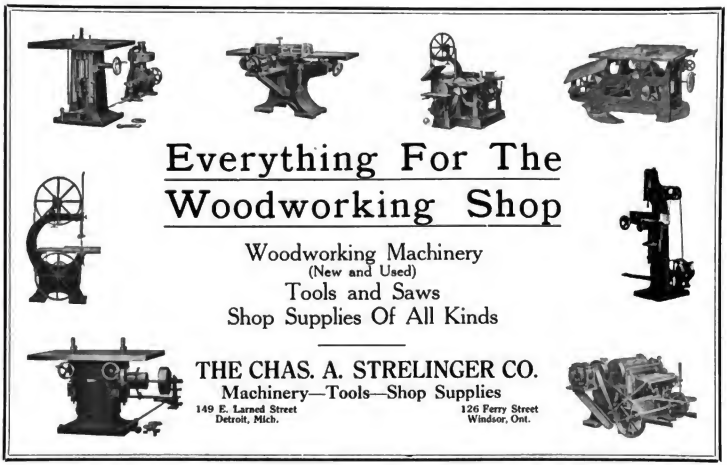
Mr. Collins is western born and bred, and started out in life with little schooling, but a knowledge of men and the endurance built from trying to wrest a living from the soil. He was born in Kirkland, Ill. When he was a youngster his parents moved to a ranch in Kansas. His father started with a good herd of cattle and fair prospects, but Texas fever killed off his cattle and left the family "stone broke." "Dick" had to go to work as a delivery boy for a licensed traders' store on the Osage Indian reservation at a trifle more than nothing a week, and long hours.

He developed selling ability from the start, which best manifested itself while a clerk in the store. He dealt chiefly with the Indians, who, in those days, were not so completely "civilized" by the flow of oil and mineral land money, the automobiles and finery of the pale-faces. They still carried their tribal weapons and their chief ambition was to get "lit" up with "fire-water" and scalp somebody. He learned a lot about human nature as a raw product, also about the possibilities of farm machinery and implements.

When he had collected eighteen years and enough of the wild west atmosphere, Mr. Collins left the reservation for Kansas City and went to work for the John Deere Implement & Vehicle Company, Moline, Ill. During the subsequent twenty years he was with this concern, Mr. Collins sold implements to dealers so successfully that he became western manager of the company, with headquarters in Kansas City. That was where Mr. Durant ran on to him.

At that time Durant was promoting the fortunes of the Durant-Dort Carriage Company, Flint, and he needed a selling director for the Kansas City branch. Mr. Collins not only could sell but he knew how to teach and make other men sell, which was the quality that Durant needed in his organization. He made Collins manager of the Kansas City branch, a position he held three and a half years.

By that time Mr. Durant had made the General Motors Company, the forerunner of the corporation of that name. He needed a sales manager for the Buick plant in Flint and chose Mr. Collins for the job. For the six years thereafter, during which the corporation control shifted to a committee of bankers, Mr. Collins kept his head and drove his sales organization forward with great energy and success. He was more than a sales manager, he was a valuable counsellor and aid to Durant himself. Consequently, when Mr. Durant regained control of the General Motors Corporation, he immediately made Collins his personal assistant, with headquarters in New York and Detroit.



In that position Mr. Collins began to handle corporation affairs in a large way. He successfully put through a deal whereby the corporation took over the Samson Iron Works, Stockton, Cal., and put the corporation in the tractor field.

When Henry M. Leland retired as president of the Cadillac, and his son, Wilfred, as general manager, to devote themselves to the construction of aeroplane motors for the war program, Mr. Collins was called from New York to become president and general manager of the Cadillac company. During his incumbency the new Cadillac sales and service building and the new manufacturing unit of the company was planned and constructed. The reputation this company had for building a fine product and backing it with superior salesmanship and service has been conserved and enhanced by Mr. Collins. His task now is to help put a new car into the field.

MAXWELL NEARING REORGANIZATION

With the institution last Friday of a temporary receivership, the Maxwell Motor Company, Inc., took the last step in accomplishing its reorganization. When the formalities of the receivership have been complied with, the new company will have clear title to all the properties. W. Ledyard Mitchell, president of the company, was appointed receiver. Under the terms of the order of Judge Arthur J. Tuttle the property must be sold for not less than $10,915,000 and all claims against the company must be filed with the special master in chancery not later than April 25. When the plans have been fully consummated the reorganized company will receive $15,000,000 of new money which has been available for some little time but was held up because of these proceedings. The way then will also be open for working out the amalgamation of the Maxwell and Chalmers corporations.

The Week in The Legislature

Condon Bill, Requiring Abstracts of Title To Motor Cars, Passed; Other Public Business

[By Staff Correspondent]

LANSING, April 11.—The Condon Bill was passed by the House last week, and with the signature of the governor will become a law July 1, and will be in full force after October 1. This bill requires all automobile owners to obtain from the state department a certificate of ownership, which is an abstract of title to the car. The owner must file a description of the automobile, together with the affidavits of two responsible persons that the representations of ownership are true. When a transfer is made, indorsement of the transfer must be made on the owner's certificate, which is then filed with the state department and a new certificate issued. All second-hand dealers, except distributors who take in their own cars in trade for new, must have a license to deal in automobiles, the license to be $25 for a year, or $15 for six months. The purpose of the bill is to do away with deals in stolen cars.

The House defeated the Johnson bill, which would have made automobile drivers at fault, in cases where they run into and kill other persons, liable on charges of manslaughter or negligent homicide. It was declared that the bill as drawn would prove dangerous and unjust in many cases. The Johnson bill would impose the penalties on drivers whenever fatal accidents resulted from speeding or driving in a reckless, careless or negligent manner. The bill was then laid on the table to be taken up later.

The House likewise defeated the Byrum bill, which would prohibit local dealers and agents from receiving commissions on materials for road and building construction work of the state and municipalities in cases where such purchases did not pass through the hands of such dealers or agents. This bill was also laid on the table.

The Senate has passed the Evans bill, which increases the highway bond limit for each year from $5,000,000 to $10,000,000, which may be issued for trunk line highway construction, and an increase in the interest rate from 5 to 5 1-2 per cent. In connection with the move of the state administrative board to bring about more efficiency, the state highway department may be the first to be hit as it is believed the overhead expenses are far too large, and that many savings could be made.

An administration bill introduced by Senator Charles Tufts, Ludington, would transfer the duties and powers of the Michigan Securities Commission to the Michigan Public Utilities Commission and abolish the former body. The securities commission has as its duty, the right to authorize increases in capital stock or flotation of bond issues, and has authorized the sale of billions of dollars of bond and stock securities.

Senator Ernest J. Bryant, Lenawee, introduced a bill which would levy a tax of 5 per cent upon the gross income of motor driven vehicles using the state highways for a profit. A measure of similar nature lost in the House.

The House passed the Smith senate bill which requires railroads to establish joint rates in cases where two or more companies use the same lines.

After eliminating corporations and exempting tangible property from taxation on an ad valorem basis, the House passed the Mosier joint resolution proposing an amendment to the state constitution by which the legislature would be authorized to enact an income tax law affecting personal incomes only.

HARDIG JOINS CAMPBELL-EWALD

Joseph L. Hardig, advertising manager of the motor bearings division of the Hyatt Roller Bearing Company, has joined the staff of the Campbell-Ewald Company, Detroit, to assist in sales promotion work.

Previous to his appointment as advertising manager of the motor bearings division of the Hyatt, Mr. Hardig was assistant advertising manager of the motor equipment division of the General Motors Corporation. In this capacity he directed advertising of the Remy Electric Company, Klaxon Company, Harrison Radiator Company and Jaxon Steel Products Company. He also acted as advertising manager of the Remy Electric Company for several years.

Mr. Hardig will handle the advertising of the motor bearings division of the Hyatt Roller Bearing Company.

GMC ASSIGNS MOTT TO DETROIT

C. S. Mott, Flint, vice-president and director of the General Motors Corporation, has been made chief of the advisory staff to succeed Alfred P. Sloan, Jr., and will make his headquarters in the General Motors Building, Detroit. Mr. Sloan will be connected with the New York production end.

TRUCK COMPANY CUTS PRICE

The price of the trucks of the Four Wheel Drive Automobile Company, Clintonville, Wis. has been reduced $700.

KING BUSINESS GAINS

H. Alperin, sales manager of the King Motor Car Company, Detroit, advises this paper that the company is receiving very encouraging and substantial orders from its distributors throughout the country, who report that business in their respective territories is increasing. The factory is progressing in good shape and the company expects to be in active production by the end of this week.

FRANKLIN OUTPUT SOLD

The H. H. Franklin Manufacturing Company, Syracuse, N. Y., maker of Franklin automobiles, reports that during March 1,005 cars were shipped, this being the total output of the factory. On April 1 orders for 843 cars for April delivery were on hand. The plant has been on a 100 per cent basis—40 cars a day—since February 10.

SEWELL CUSHION WHEEL ELECTION

The Sewell Cushion Wheel Company, Detroit, on April 1 paid the regular quarterly dividend of 2 per cent on preferred stock and 8 per cent on the common. At the annual meeting, April 5, the following directors were re-elected: Charles Rider, Arnold B. Cooper, Herbert J. Sewell, Ralph S. Moore, John H. Hammes and Walter T. Sewell. The directors re-elected officers as follows: H. J. Sewell, president; J. H. Hammes, vice-president; R. S. Moore, secretary, and W. T. Sewell, treasurer.

PACKARD'S PRODUCTION SCHEDULE

H. H. Hills, vice-president of the Packard Motor Car Company, Detroit, addressing the Detroit Real Estate Board last week, announced that the company was employing 2,700 men in its factory and that it was probable that the number would be doubled by the end of June. The present output, he said, was 800 cars a month.

SHIPMENTS INCREASE 63%

The report of the traffic committee at the meeting of the Detroit and Cleveland Automobile Chamber of Commerce, April 5, indicates greatly increased activity in motor car shipments and sales. The shipping record of factories producing two-thirds of the total volume indicates that complete figures for March will show an increase of 63 per cent over February shipments. A year ago the March shipping board was the heaviest of any single month on record and exceeded February by 20 per cent. Shipments for March this year will be 42 per cent of this record month a year ago. In February shipments increased 58 per cent over January. This increase in the previous year was 13 per cent. The figures for March will amount to 16,500 carloads, in addition to which 10,000 machines were driven overland from the factories. In February there were 9,920 carload shipments by rail and 7,491 machines driven overland.

FORGE CONCERNS ON 50% BASIS

The Atlas Drop Forge and Federal Drop Forge plants, Lansing, are operating on a 50 per cent basis. The Atlas company is working on a diversified line, such as automobile and truck business, gas engine, agricultural implements and railroad equipment. The gas engine business shows signs of improvements, while the two companies see the motor industry reviving. The Atlas company expects to reach capacity production within a few days.

OLDS BUSINESS LOOKING UP

That the Olds Motor Works, Lansing, is rapidly returning to normalcy is indicated by the steady increase in production and the number of orders received. The April manufacturing schedule is the highest since last summer, with production for the year practically organized. During March the plant turned out 2,500 Oldsmobile Fours. The production of Eights is getting well under way on both models. The General Motors spent $2,000,000 in new machinery, tools and apparatus to produce this model, and the installation of machinery, which was begun last fall, has been completed.

The boom of business at the Oldsmobile plant has helped a number of other Lansing industries, including the Motor Wheel Corporation, Melling Forge Corporation, Rikerd Lumber Company, Michigan Brass & Iron Company, Gerson-Carey Company, Michigan Screw Company, Ryan-Bohn foundry and the body factories.

Edward Ver Linden, general manager of the Olds, has returned from New York with an order for $1,750,000 worth of Oldsmobiles from the Gotham distributor. This order means 1,000 passenger cars to be delivered before May 1. Twenty-five per cent of the order is for enclosed cars.

REPUBLIC PROMOTES CRISP

Glenn S. Crisp has been elected assistant treasurer and assistant comptroller of the Republic Motor Truck Company and Republic Truck Sales Corporation, Alma, according to announcement of Col. Frank E. Smith, vice-president and general manager. Mr. Crisp has been identified with the Republic organization five years, during which time he has occupied important positions in the financial and accounting divisions.

FLINT AND KAZOO IMPROVEMENT

From Flint come reports of increasing activities in the automotive plants. Five hundred and fifty cars were shipped over one railroad alone, week before last, and it was expected that the total would reach 700 last week. The largest driveaway ever sent out of the Vehicle City for one dealer left the Buick plant last week—75 cars being started for Detroit. Of that number, 67 were reported to have been sold at the Detroit automobile show.

At the monthly meeting of the Kalamazoo Automobile Dealers' Association, last week, it was reported that the demand for new and used cars in that city was about 80 per cent of what it was at this time in 1920 and 1919. The warm weather has proved a stimulant.

CONDITIONS IN AKRON

Reports from Akron are to the effect that tire sales for April will be considerably larger, as against March—70 per cent in the case of Goodyear. Firestone is operating two eight-hour shifts and Goodrich and Miller are at 50 per cent of normal, with orders ahead of production in the case of the former. The Mohawk Tire & Rubber Company is reported to be operating at 35 per cent of normal, with orders double production and 30 per cent higher than in January or February. The Portage Rubber Company, which is operating on an 80 per cent basis, is said to be expecting to reach 100 per cent within the next 30 days.

STUDEBAKER'S OUTPUT

A. R. Erskine, president of the Studebaker Corporation, is quoted as having announced that the Corporation will be producing 85,000 cars monthly by June and that this basis can be maintained indefinitely.

Digitized by Google

AUTO BODY'S OUTLOOK

The Auto Body Company, Lansing, has added 150 men to its force within the last two weeks and has increased its production to take care of releases of orders authorized by various motor companies. Such releases have been made by the Scripps-Booth, Auburn, General Motors Truck and Olde Motor.

A conference has been held by officials of the Auto Body and the Briscoe Motor Corporation relative to the resumption of production for the latter. The Auto Body had started on releases for the Briscoe concern this spring, when notified to hold up this production temporarily. With the Briscoe reorganized and refinanced a still greater output is looked for.

The Auto Body Company holds the contract with the Olds Motor Works for the new Oldsmobile Eight.

BRISCOE'S PLANS

According to the Wall Street Journal, the reorganization of the Briscoe Motor Corporation, Jackson, involves putting the factory on a production basis of about 75 cars daily. It is understood, the Journal adds, that the company has the financial backing of the Tilden interests, Chicago, who have furnished all or part of the $2,000,000 additional capital announced last week as having been acquired. Stockholders are being offered 100,000 shares at $20 a share. The market for the outstanding 90,000 shares of no par value has been around $24. Clarence A. Earl, former vice-president of Willys-Overland, has been elected president. The deal whereby W. C. Durant sought to obtain the factory for Durant Motors, Inc., is said to have fallen through.

The Briscoe general executive staff is now as follows:

Clarence A. Earl, president and general manager; H. F. Wardwell, vice-president; J. R. Findlater, vice-president, Pacific coast manager; John Fletcher, treasurer; LeRoy C. Allen, assistant treasurer; L. E. Latta, secretary; Kelly R. Jacoby, general sales manager; R. N. Cowham, assistant general sales manager; D. Minard Shaw, advertising manager; R. M. Chapman, assistant to C. A. Earl; Victor Janisch, chief engineer; J. C. Cunningham, general superintendent; T. W. Tinkham, assistant general superintendent.

D. A. D. A. ANNUAL MEETING

Guy O. Simons, president of the Simons Sales Company, Detroit, was elected president of the Detroit Automobile Dealers' Association at the annual meeting in the Detroit Athletic Club, Detroit, Monday evening. A. L. Zeckendorf declined re-election. The meeting was also a celebration of the success of the Twentieth Annual Automotive Show. Other officers elected were: H. R. Graham, Owen & Graham vice-president; R. H. Williams, Williams & Hastings, secretary; Walter Judd, Miller-Judd Company, treasurer; Charles Hathaway, LaFayette Distributing Company, director; Walter J. Bemb and Mr. Graham, delegates to the National Automobile Dealers' Association convention, Hotel Statler, Detroit, April 19.

S. A. E. TO UNITE PIONEERS

When the Society of Automobile Engineers meets in West Baden, Ind., this summer for the annual meeting, Howard Coffin, vice-president of the Hudson Motor Car Company, Detroit, will make an effort to get together all the old time automotive engineers dating from 1910 or earlier and interest them in the Old Timers Club.

TRUCK MANUFACTURERS' MEETING

For the purpose of discussing changes in the service and spare parts distribution methods, the Motor Truck Manufacturers' Association of America met in Hotel Wolverine, Tuesday.

What Trucking, Bus and Storage Company Operators, Organized Last Week at Grand Rapids, Hope to Do

MICHIGAN is the latest state to have an organization of trucking, bus and storage company operators. Delegates representing the several hundred cartage men of the state assembled at Grand Rapids April 6, and organized the Michigan Highway Transportation Association. Officers elected were:

President, E. Foster Moreton, Detroit; first vice-president, E. M. Radcliffe, Grand Rapids; second vice-president, W. G. Stone, Hillsdale; treasurer, H. G. Beebe, Battle Creek; secretary, W. H. Hardy, Lansing; directors, the above and Henry Stevens, Flint; F. H. Stevens, Saginaw; Edgar T. Raseman, Kalamazoo; E. A. Hopperstead, Muskegon; Charles J. Foster, Cadillac; C. L. Aiden, Benton Harbor; Henry Wellman, Hastings; A. Alexander, Battle Creek; W. J. Lantrange, Mount Pleasant, and L. J. Flanagan, Marquette.

State headquarters will be in Lansing, in Mr. Hardy's offices, with the Fireproof Transfer & Storage Company.

The coming of the state organization is the result of about two years of preparation and continuous development of the cartage industry to a point where the state began to recognize it as one of the important units in its transportation system. There has been put into completion a heavy program of highway construction, which made possible the establishment of motor truck and motor bus lines between cities where other methods of transport were either incompleted or where they had not yet been developed. The importance of Michigan as a motor truck manufacturing state also went far toward stimulating thought along lines of organized trucking transport. Michigan has come to recognize the development to such a degree that the 1921 Legislature has given much consideration to regulation and taxation of the cartage industry, which really provided the incentive for getting the state organization going.

The objects of the Michigan Highway Transportation Association are strictly along the line of what concerns the best interests of the industry. Clearing of information of mutual benefit to members in different sections; education in costs of operating vehicles of all varieties under varying conditions; preparation of sound legislation for the furthering of the industry; opposition to inimical legislation, national, state or local; co-operation with local officials in preventing any kind of highway practices that might arouse opposition to trucking; development of new sources of business; educating the public in the possibilities of the truck and creating good will and interest in highway transport.

The Grand Rapids meeting was held at the Hotel Pantlind, and about 60 delegates from fifteen counties attended. E. M. Radcliffe, Grand Rapids, affectionally known among his compatriots as "Rad," presided. "Rad" is secretary of the Grand Rapids storage and cartage men's local body. He furthered harmony and gave breadth to the discussions on various subjects that vitally interested the delegates.

The informal discussion which marked the

(*Continued on Page* 19)

COMMERCIAL HAULING

Detroit—Members of the Detroit Transportation Association will hold their regular meeting, April 19, at the new offices at Third and Howard streets. The work of the month will be reviewed and convention plans discussed.

President E. Foster Moreton, of the Association, is anxious to expedite acceptances from persons who will be able to attend the convention in June. It is hoped to be able to charter the steamer "Noronic," provided that sufficient reservations are forthcoming. This would call for a three-day cruise, beginning June 13, into Georgian Bay, with stops at several Canadian cities.

Dump truck hauling is occupying much time of the Association officers. Owners of such equipment recently have accepted much work without first determining whether or not the rates received were adequate. Cost data has been prepared and much work done in addition to make it possible for dump truck operators to know what operation is costing.

Detroit—The Wayne Furniture Packing Company and the Schroeder Moving Company have been consolidated, the former's firm name being retained. Officers are: President, C. W. Schroeder; vice-president, H. J. Schroeder; general manager, S. U. Blake. The company has added to its equipment by the purchase of a dust-proof van, which was an exhibit at the Detroit automobile show.

Detroit—The trip of E. Foster Moreton, president of the Detroit Transportation Association, and his party to the state meeting at Grand Rapids last week was eventful. At South Lyons he ran into a local crime wave and was subjected to search by a local deputy. Beyond Lansing the party left the main road in the night and regained it only with difficulty. Returning, the automobile suffered a broken axle and the car limped into Lansing in the small hours.

Lansing—The Legislature is expected to be quite merciful to the trucks this session, thanks to some effective missionary work done in the state house. At least two more years are needed before the industry can be properly stabilized and put on a firm basis, during which time, the legislators were shown, it would not be wise to hamper it with too much regulation. The Legislature appeared entirely willing to allow the time and expects the leaders in the hauling industry to come forth with constructive legislation at the 1923 session.

Lansing—The Michigan motor vehicle license tax and all other licenses and fees in connection with it, for the first three months of this year totaled almost $5,000,000, according to the apportionment account made to the auditor general by the state department. The entire amount for 1920 was $5,644,583 and for 1919, $5,719,433, while for this year it is estimated the tax will total between $2,000,000 and $8,000,000. Half of this amount is paid back to the county in proportion to the sum it has paid into the state treasury. All of the tax is to be used for highway purposes, the state's share being used for payments on state rewards. Wayne county's total of $1,497,723 received by the state department during the first three months was $1,489,028, and the county receives back $744,514. Ingham county paid in $124,860, and receives $62,430. Kent paid $234,929, Oakland, $157,929; Saginaw, $139,527; and Genesee, $146,252. The lowest is Keweenaw, with $44.85.

Something About the New Cartage Assn. Secretary

Meet a new secretary.

W. H. Hardy, manager of the Fireproof Storage & Transfer Company, Lansing, has been intrusted with the delicate and arduous task of getting the newly organized Michigan Highway Transportation Association started and functioning. This action was taken at Grand Rapids last week, when cartage operators, movers, bus line men and storage company heads assembled.

Mr. Hardy looks 30, but his experience with transportation matters and his advancement make a story that would indicate more years than that. He started life with the idea of "teaching the young idea how to shoot," and

W. H. HARDY

after having been graduated from the Reed City High school, went to learn pedagogy at the Mt. Pleasant normal.

The express business claimed him first, however, and for several years he was with the American Express Company, as agent at Grand Haven, cashier at Cleveland, route agent at Bay City and local agent at Lansing. He left that field to enter the purchasing department of the Duplex Truck Company, Lansing. He is now secretary-treasurer and general manager of the Fireproof Storage and Transfer Company.

Mr. Hardy intends to get behind the Association and push it to the limit, so that the rapidly expanding interests of Michigan may have a central point from which to wage their fight for progress.

Detroit Chapter, A. I. B.

[Members of the A. I. B. are invited to contribute news items or other matter which may be of interest to the Detroit Chapter.]

Secretary A. J. Chapp, of the Detroit Chapter of the American Institute of Banking, reports that the various chapters of the Institute are staging elimination debates to ascertain which teams will participate in the annual debate at the Minneapolis convention in July.

On Friday, April 8, there was a debate at Toledo, under the auspices of the chapter in that city, which was won by the New York team. The subject was: Resolved, That Congress adopt a bill identical with the Johnson house bill 14461 of the last session of Congress (restriction immigration). New York took the affirmative and Chicago the negative.

The Detroit Chapter sent a delegation of 100 members by special interurban car.

HARDENING

We are equipped to take care of the treating of steel and make a specialty of automotive parts. We also can carbonize or temper tool, jig and fixture parts. Our truck enables us to give you 24-hour service.

GRINDING

Special screw machine equipment enables us to specialize in the manufacture of the following parts, all of which can be ground by the centerless method. We can grind to any accuracy required.

Piston Pins — Detroit Pins Hardened Straight — Headless Shackle Bolts
Valve Roller Pins — Oil Pump Plungers — Universal Joint Pins
Roller Clutch Pins — Roller Bearing Bolts Straight — Small Gear Shafts
Differential Gear Pins

DETROIT ENGINEERING NOMINATIONS

The following nominations have been made for president of the Detroit Engineering Society for the ensuing year. M. W. Taber, Auto Manufacturers' Service Company; J. R. McColl, Ammerman & McColl; L. E. Williams, marine manager, United Fuel & Supply Company; E. S. Reid, vice-president and chief engineer, Northern Engineering Works; W. F. Zabriskie, vice-president and general manager, Gabriel Steel Company, and A. L. Trout, consulting civil engineer. O. H. Dawson, of Kendrick & Dawson, is nominated for secretary-treasurer without opposition. The election will take place at the annual banquet, April 29.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Chicago—The United States Railroad Labor Board has declined to put into effect a temporary wage reduction, retroactive to April 1, as asked by the Michigan Central Railroad Company and 25 other lines. In denying the petition the board announced that the only fair course appeared to be to hear at one time and decide in one finding just what constitutes a reasonable wage for all classes of workers. Monday, April 18, was set as the date of the beginning of this hearing. Besides the Michigan Central, the other railroads operating in Michigan affected by the decision are the Detroit & Mackinac, Ann Arbor, Chicago & North Western and the Lake Shore & Michigan Southern. Henry Shearer, vice-president and general manager of the M. C., says the decision of the board will not affect the proposed wage cut. He said it bears only on the retroactive clause.

Detroit—The Municipal Railways system has been placed on the city tax rolls at $1,500,000, or half the actual value as represented by $3,021,461.44, the amount of money so far expended in its construction. Plans for the Mack and St. Jean avenue crossings over the lines of the D. U. R. have been submitted to the D. U. R. engineers.

Lansing—The Michigan Public Utilities Commission has approved the sale of the Michigan Connecting Railway by the J. H. Moores estate, of this city, to the Grand Trunk Railroad Company for $40,000. The railroad spur gives service to many factories in the southeastern part of the city.

Detroit—Freight loading thus far for April shows a slight increase over the month of March, but transportation conditions are far from satisfactory, according to H. O. Halsted, superintendent of car service of the Pere Marquette Railway. This applies to all kinds of freight, and the increase is largely made up by the movement of grain and hay, of which there are still large quantities in the state. Loading for the month of March this year is showing better than March of last year, for it was during that month that the switchmen's strike developed.

St. Louis—Reductions in salaries of executives and wages of employes will be made by the Missouri Pacific Railroad as a part of its plan of retrenchment. Approximately 30,000 employes will be affected.

Detroit—Judge F. L. Covert, Circuit Court, has decided that the D. U. R. must adhere to the split fare plan provided in the franchise for the Pontiac-Birmingham line, the split fare to be operative between Birmingham and the Six-Mile road, President Place of the 22 cents now charged. Judge Covert holds the franchise as valid.

Philadelphia—The Pennsylvania Railroad Company's proposed 12 to 20 per cent cut in wages has been accepted by the freight and accounting clerks here, but rejected by all the other organized employes. The reductions would affect 16,000 employes.

Lansing—Time saving concessions of value to Michigan country shippers of livestock were obtained from the railroads by the traffic department of the State Farm Bureau at the recent "Two for One" hearing in Chicago. The railroads were induced to change the present rule providing that they shall have six days to place livestock cars at country shipping points, to four days, and to agree that in case they were unable to furnish a double deck car ordered, they would supply two single decks within the four-day time limit. The new ruling reads, "Four days after the next 7 a. m. after ordering car." Tariffs will be issued as soon as they can be published and will affect shipments to both Buffalo and Detroit.

Washington—Class and commodity freight rates from points in southwestern Michigan to points on eastern trunk lines and in New England territories will remain as listed despite the efforts of the South Bend Chamber of Commerce, the Michigan Traffic League and Manufacturers' associations of Michigan and Indiana to obtain a re-grouping with lower rates. The various associations filed a complaint against the railroads with the Interstate Commerce Commission to the effect that existing rates in this territory were relatively unreasonable and prejudicial to the shipping interests of southwestern Michigan. This complaint was filed last January and the I. C. C. last week ruled that existing rates must stand, with the exception of Holland, which is taken from the 92 per cent group, while Watervliet is included in it.

PETOSKEY TRANSPORTATION CO.

The following have been elected directors of the recently organized Petoskey Transportation Company: A. B. Kilbe, J. B. John, John L. A. Galster, Henry Vanderberg, J. C. Buckbee, L. A. R. Moore, Joseph A. Magnus, Louis Seelba, W. N. Andrews, Homer Sly and John A. Kilze. Officers elected: A. B. Kilbe, president; J. B. John, first vice president and general manager; John L. A. Galster, secretary and treasurer. The capital stock of the company is 100,000 shares of preferred stock, par value $10. There are also 100,000 shares of common stock without par value. All stock is fully paid and non-assessable.

NEW PHONOGRAPH PLANT

Negotiations whereby the Cheney Talking Machine Company, a subsidiary of Marshall Field & Company, Chicago, obtains a five-year lease from the Berkey & Gay Furniture Company of its large plant in Mill avenue, Grand Rapids, have been closed. The consideration is estimated to be nearly $1,000,000. This deal, according to advices from Grand Rapids, gives to that city a leadership in the manufactnie of phonograph cabinets. The capacity of this plant is 300 cabinets a day.

WILL SUPPORT WATERWAY

The up-river city of St. Clair, home of the Diamond Crystal Salt Works and other industries, has formed a chamber of commerce which bids fair to play an important part in shaping the future of that city industrially. The membership is said to be more than 100 out of a population of only 1,500, and the organization is receiving enthusiastic support At a meeting Tuesday, April 12, Tom L. Munger, of the Board of Commerce, spoke on the advantages of the proposed St. Lawrence waterway, and the organization decided to take an active part in the promotion of the development by sending representatives to Washington to plead for the bill. Resolutions also were passed commending the proposed revision of the Seamen's act. Officers are: President J. J. Gannon, director of the Diamond Crystal Salt Company; secretary, Chase Crissey, cashier of the State Savings Bank.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Washington—Representatives of the National Federation of Construction Industries have presented to James J. Davis, Secretary of Labor, plans for a conference of contractors, manufacturers of building materials, architects, engineers and workmen, looking to the launching of a national building campaign, May 1. The Secretary has indorsed the plan.

Eaton Rapids—Work has been started on a one-story factory building for John B. Davidson, who will occupy it was a textile making plant. The building will be 200 by 65 feet in dimensions. Mr. Davidson was for a number of years general superintendent of the Eaton Rapids Woolen Mills.

New York—Announcement of an advance of $2 a ton in the price of bars, plates and structural steel is made by the Republic Iron & Steel Company. The increase is to cover rising costs of production, accordiog to John A. Topping, chairmun of the board of directors.

Saginaw—F. P. Little, superintendent of the Toledo-Ludington division of the Pere Marquette Railway, says the chief engineer's office of the road has about completed plans for a $1,000,000 bridge over the Saginaw river here, at the site of the present Potter street span. It is probable the bridge will not be built until 1922.

Detroit—Among the jobs awarded by architects and reported in the weekly statement of the Detroit Builders and Traders' Exchange are the following: General contract on the brick and steel warehouse building for the Contractors Equipment Company; alterations on an engine house; a brick and concrete show stable to be erected for the Michigan State Fair Association, and several residences and minor jobs. Among new work being prepared by architects are two theaters, a hotel, several stores and residences.

Detroit—A total of 447 building permits were issued during the week ended April 9, the total outlay represented being $2,729,865, or more than three times as much as for the previous week, when cost involved was only $830,690. Of the total, $1,545,600 comes under the heading of alterations and additions, and concerns work at the Cass Technical High School. Of the 447 permits, 308 were for new buildings and 139 for alterations and additions.

Detroit—Building Commissioner John C. McCabe has announced that 1,131 building permits were issued during March, the construction cost involved being $5,650,930. The amount is more than $3,000,000 below the March record for 1920.

Monroe—March permits totaled 29 the cost involved being $27,170. It was the best month in the last four months.

Saginaw—Total outlay represented in the 195 permits issued during March was $111,844, a considerable increase over February but below the March, 1920, record, which in money was $160,928. The gratifying feature was that nearly half of the money involved was for 22 dwellings to cost $54,500. There were 56 permits for garages and minor buildings, the cost being $41,294.

Jackson—Seventy-eight building permits were taken out during March, involving an expenditure of $65,485. Of the total, $49,315 was for new construction work and $16,170 for repairs or alterations.

Lansing—C. C. Ludwig, of the Republic Sales Company, and Ralph W. Ballantine, manager of the insurance department of the Michigan Mortgage Investment Corporation, have leased the Moores block. The property is 136 by 132 feet. The lessees' plans have not been announced, but both a hotel and office building have been proposed.

Detroit—Nummoth coal-bunkering docks are being constructed at Jacksonville and Fernandino, Fla., by Jewett, Bigelow & Brooks, miner operators in Kentucky and West Virginia. The docks are for loading export coal to Mediterranean ports.

Lansing—With the permit obtained, work was started the first of this week on the construction of the ten-story Prudden store and office building on the site of the structure destroyed by fire some time ago. The Rickman Contracting Company, Kalamazoo, has the contract and P. L. Rickman has personal supervision of the structural work. The building is to be completed by the first of next year.

Detroit—A two-story, reinforced concrete garage, 100x90x25, to cost $110,000, will be erected on Canfield, between Cass avenue and Second boulevard by F. J. Whitney, 408 Detroit Savings Bank building. Nathan Sverdloff, 944 Savings Bank building. Nathan Sverloff, 944 Marston avenue, will construct a two-story brick and stone store and flat building on Twelfth street, between Clairmount and Taylor avenues. The cost will be $9,000.

Lansing—During the last week of March 34 building permits were issued in Lansing, bringing the total for the month to 164, or 45 more than for March, 1920. The total estimated expenditure for building was given as $240,501.

Jackson—During the week ended April 9 permits taken out represented an aggregate expenditure of $36,566. Of this amount $19,676 was for 13 garages; $14,165 for four residences and $2,800 for miscellaneous jobs.

Battle Creek—March permits showed plainly the improvement in business. The total cost was $59,375, an increase of more than 100 per cent over February and four times as much as was expended in January, when the total was $13,525. The general outlook is that April also be a good month.

Detroit—The need of additional court rooms and offices in the Wayne County Building may cause the county supervisors to order the addition of two stories to the building, which was constructed so that such an enlargement would be possible.

PAINE-WEBBER BOOKLET

The recent circular issued by Paine, Webber & Company analyzing the finance of Sears, Roebuck & Company contains some matter of unusual interest. Besides showing the unusual earning power of this company under normal conditions, the circular points out that an original investment in 1907 has now grown to nearly ten times its size at the beginning by means of stock dividends.

SAGINAW B. & L. BUYS HOME

The Saginaw Building & Loan Association has purchased the old Bank of Saginaw building at 406 Court street, now occupied by the Paul Krause shoe store, according to an nouncement by John L. Jackson, president of the Association. Occupancy will be had at the expiration of the present lease, which has two years to run, after which time the building will be remodeled into a modern banking office. This association is one of the oldest business organizations on the west side of Saginaw, having been founded 33 years ago.

Robert Y. Speir, heretofore vice-president and cashier of the Capital National Bank, Lansing, becomes vice-president and manager, the title of cashier going to Hon. Frank E. Gorman, as announced elsewhere in these columns.

(Continued from Page 14)

morning session revolved itself into a symposium on local conditions and rates. The delegates compared notes on many phases of their business and discussed inter-city business, moving, local delivery, jitney operation, dump truck hauling, etc. Many of the delegates listened for the first time to general discussions of their business.

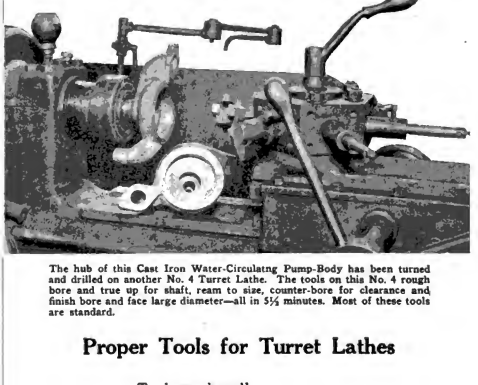
The first year's work for Secretary Hardy will be largely one of organization. He is preparing an office for the Association, with a clerk in charge who will act as his secretary for all association matters.

The following attended the meeting:

W. G. Stone, Associated Truck Service, Hillsdale; Henry H. Stevens, Flint; F. H. Stevens, Stevens Brothers, Saginaw; A. H. Shank, Shank Fireproof Storage Company, Grand Rapids; J. Zevalkink, Columbian Storage Transfer Company, Grand Rapids H. G. Beebe, Union Truck & Storage Company, Jackson; Ben Zevalkink Columbian Storage Transfer Company, Grand Rapids; Louis Stonehouse, Stonehouse Cartage Company, Grand Rapids; W. C. Wheeler, John Wheeler Cartage Company, Saginaw; T. W. Hastings, Hastings Truck Company, Kalamazoo; W. H. LaFayette, LaFayette Transfer Company, Muskegon; M. G. Moon, Moon Brothers, Cadillac; C. G. Foster, Charles J. Foster Company, Cadillac; F. W. Richmond, Associated Auto Urban Lines, Grand Rapids.

O. L. Alden, Alden & Son, Benton Harbor; Theodore Green, Green & Company, Benton Harbor; W. Dowding Dowding Truck & Transfer Company, Flint; Henry Wellman, Hastings Transfer Company, Hastings; K. W. Becker, Becker Cartage Company, Hillsdale; Robert Sallows, Emmerson Truck & Storage Company, Battle Creek; Sam Thompson, Muskegon; John R. Salter, Muskegon; J. W. Thunfors, Muskegon; Z. V. Morningstar, Muskegon.

J. D. Cooper, Jitney Lines, Muskegon; L. M. Becker, Becker Brothers, Hillsdale; W. J. Le Strange, Mount Pleasant; F. J. Gaffnett, Mount Pleasant; J. W. Emmerson, Emmerson Storage & Sales Company, Battle Creek; E. A. Hopperstead, Hopperstead Transfer Company, Muskegon; L. Peherson, Motor Transit Company, Muskegon; George Wilson, Wilson Cartage Company, Detroit; Charles Wilson, C. & H. Wilson Company, Detroit; E. Foster Moreton, Moreton Truck Company, Detroit.



Fred J. Keesis, City Cartage Company, Detroit; F. L. Henk, Detroit Transportation Association, Detroit; L. R. Blodgett, Elliston Packing & Storage Company, Grand Rapids; David E. Burns, Republic Motor Truck Company, Alma, L. G. Van Loon, Van Loon Moving Company, Muskegon; Thomas O'Brien, O'Brien Cartage Company, Detroit; E. M. Radcliffe, Radcliffe Storage Company, Grand Rapids; H. Kammen, Kammen & Vanderstel, Grand Rapids; H. V. Wood, Associated Truck Lines, Grand Rapids; James De Good, De Good Transfer Company, Grand Rapids; S. Helmus, Helmus Brothers, Grand Rapids; A. L. Martin, Central Storage Company, Grand Rapids; A. De Groot, De Groot Transfer Company, Grand Rapids; H. H. Hardy, Fireproof Storage & Transfer Company, Lansing.

The Michigan Manufacturer and Financial Record was made official organ for the state association and will conduct a motor trucking news department within its columns and assist the state officials in every way to build up a strong membership, as well as to tell all its readers what is happening in the storage and transfer field.

WINTER SUCCEEDS F. W. ALLEN

Walter Winter is now manager of the foreign department of the American State Bank, Detroit, succeeding Fred W. Allen, who resigned recently to return to Chicago, where he has become associated with the Northern Trust Company.

Mr. Winter hails from New York and has had considerable experience in foreign exchange and international banking. He has been connected with the foreign department of the National City Bank, New York; Knauth, Nachod & Khuene, and A. H. Whan & Company, foreign exchange auditors, and also has spent some time in London with the Deutsche Bank and in Paris and Hamburg with the Bourse de Paris.

The hub of this Cast Iron Water-Circulatng Pump-Body has been turned and drilled on another No. 4 Turret Lathe. The tools on this No. 4 rough bore and true up for shaft, ream to size, counter-bore for clearance and finish bore and face large diameter—all in 5½ minutes. Most of these tools are standard.

Proper Tools for Turret Lathes

To do work well
a turret lathe must be equipped
with the proper tools.

Tools make or mar
a good turret lathe.
Re-tooling a turret lathe
often doubles its production.

DETROIT, SATURDAY, APRIL 16, 1921

Steps in the Right Direction

TWO encouraging and significant bits of news have come out of Lansing during the last week. One of them is that Secretary of State Charles J. Deland has by dint of discharging some forty superfluous employes reduced his biyearly budget by $180,000—from $1,088,000 to $608,000—and the other that immediately after the Legislature adjourns an "efficiency survey" is to be undertaken by the State Administrative Board to prune wherever possible in all departments.

These are steps in the right direction and Mr. Deland and the Administrative Board are to be congratulated. Most every time the Legislature meets, the state officials have all ready for its consideration divers and sundry ways and means of raising additional revenues to meet new expenses. There has been in the past all too little thought about how economies could be effected. With a budget this year which probably will be two or three million dollars higher than two years ago, it would appear that splendid opportunity is afforded for practice with the carving knife. It is too bad that the Legislature did not immediately after going into session inaugurate what the Department of State and the Administrative Board are now taking up. Perhaps if it had, there would have been no need for consideration of the corporation tax and the state income tax and the other levies which have been or are about to be enacted.

Just how much the state officials will be able to lop off as a result of their investigation, or, knowing how much they could lop off, will lop off, we do not, of course, venture to predict. But the saving possible is considerable. There has been some criticism of the State Highway Department, among others. The statement has been made that this department is "loaded up" with surplus employes and equipment—that, in fact, its outlay could be reduced 50 per cent without sacrificing efficiency. Just how much of that criticism is honest and sincere and how much may have been inspired by persons unfriendly to Commissioner Rogers would be hard to say, but the Department will not suffer from an inquiry into its affairs.

The Administrative Board, once it has got started, should go all the way down the line, looking carefully and impartially into the affairs of all the departments and institutions, cutting out any overplus of employes that may be found. We have an idea that some of the institutions especially will bear investigation. Certain nasty charges against some of these institutions have been made in the Legislature, and it is only fair that inquiry searching enough to prove or disprove them should be made. Incidentally, the investigators may find opportunity to cut expenses by a few hundred thousands of dollars here and there.

With the process of deflation ruthlessly squeezing the false enthusiasm out of business the country over, with prices being forced downward, with the prevailing stern necessity for reducing expenses everywhere, it is high time that the process be extended to the administration of public business. The cry now is not, "How can we spend more money?" but "How can we keep from spending money?" Taxation should go down with prices. And the quickest way to reduce taxation is to reduce the expenditures to meet which taxes are collected—just as the only way to reduce prices of commodities is to reduce the costs of production and sales. The orgy of reckless money spending is past; we have gone over into an era of getting value received. Let's get it, both in public and private business.

Mr. Ralph Stone, president of the Detroit Trust Company, has well expressed in a letter to Mr. Deland what the state's feeling toward that official should be for his action in starting the ball rolling. Mr. Stone writes:

"It takes considerable political and personal courage to do a thing of this kind, and the instance is so conspicuous a one that I want to go on record with most hearty congratulations and thanks to you for bringing it about.

"Most of the effort nowadays seems to be centered upon devising new ways of raising money by taxation to operate federal, state and municipal governments. I think public officials charged with this responsibility generally recognize that the cost of government can be lessened by reducing the expense of running it, but I regret to say very few public officials have the courage to cut their own budgets. Your case is so conspicuous a one that it cannot help but attract very wide notice. I hope it will offer a contagious example."

Let us sincerely hope it will.

Putting the Waterway Through

IT SEEMS TO BE the consensus of opinion among those who have followed with any degree of continuity the hearings conducted by the International Joint Commission on the proposed Great Lakes-St. Lawrence Deep Waterway that the Commission will recommend to the Canadian Parliament and the Congress of the United States that the waterway is highly desirable and should be built. The evidence adduced for the Commission's enlightenment has been so conclusive, and the position of what opposition there is has been shown to be so selfish, that it would seem to be difficult for the Commission to escape the conviction that here is a great public necessity in the way of which nothing should be allowed to stand. From Montreal and New York on the east, on through Cleveland, Detroit and Chicago to Winnipeg on the west, there has been brought forward a preponderance of testimony showing from every angle the incalculable benefits which would accrue to the business of the two nations through the opening of this inlet and outlet of world commerce. Not only that, but some of the country's foremost engineers and builders have come forward with facts and figures to prove that the power to be developed along the route would of itself alone pay the cost of the improvement. The project has been shown to be feasible from an engineering standpoint. Nothing, therefore, would seem to block favorable action at this stage.

But the battle for the waterway will not have been won should the Commission's findings be what everyone expects. The opposition has another line to fall back upon, and there it will wage a determined fight. The battle lines next will be drawn in the Canadian Parliament and the American Congress. The Eastern interests who have contested the West's case make up for whatever lack of numbers they may possess by the fact that they are well financed and skilled in the business of influencing legislation, and no one need expect anything else than that they will bring to bear on the lawmakers every means of persuasion at their command. Those who have carried on the fight for the waterway must be prepared for a real test of wits. In the hearings before the Parliament and the Congress they must be ready to present a case in which not a loophole may be found and must draft for the task of presentation the ablest minds among their number. They must not allow themselves to be lulled into a false sense of security by the fact that the Joint Commission's report is favorable. The report will not be enough.

So, to put the waterway through it will be necessary to

Digitized by Google

PUT IT THROUGH, just as Grant said when asked how he was going to Richmond that he was "going to Richmond." The same earnestness and thoroughness which has characterized the hearings before the Commission must mark the hearings before Parliament and Congress, and, in addition, every precaution must be taken in choosing the men to steer the battle on the floor and in making sure that the bill does not run into conflicting currents of self-interest among the lawmakers and be swallowed up in defeat.

Doctoring Up Liberty Bonds Again

WHEN our always well-meaning chairman of the Ways and Means Committee of the House of Representatives, Hon. Joe Fordney, was quoted in the Detroit Free Press last week as favoring a plan which would compel the Federal Reserve Banks to give lower interest rates on loans secured by Liberty bonds, we thought at once of the six-footer trying to cover himself with a five-foot sheet. You will no doubt scent the connection between the two, but there is one. First, however, it should be remarked that a special interest rate on such loans would not be the panacea for discounted market values. Many no doubt would jump at a chance to borrow on their Liberty bonds provided the rate of interest paid on the loan were not appreciably greater than the interest received on the bonds, but that would be the only attraction short of making a sale at par.

Most borrowers now know, when they borrow on collateral, that they give the lender a pretty broad control over their property so pledged. They know by experience that if the lender becomes uneasy he can, and may, sell the collateral at the best market obtainable without much ado or ceremony. They know that pay day comes around eventually and that anything short of a sale of their bonds requires the loan repaid sometime. So the proposal becomes one largely of providing a cheap method of obtaining loans for those who have use for the money. Certainly any banker who suspects that a borrower is trying to "sell" his bond through the medium of borrowing on it will side-step quickly.

But above all this proposal brings us right back to the old proposition of trying to make the five-foot sheet cover the six-foot man. If the Federal Reserve Banks extend any number of millions of loans on Liberty bonds they will have so much less for business; so it's a case of making the sheet cover the feet and expose the neck, or vice versa. Instead of pushing the market value of the bonds up to par, the more probable result of an arrangement such as suggested by Mr. Fordney would be to push the market value down a few pegs. Leaving out the tax feature, Liberty bonds are below par because more people wish to sell them than wish to invest in them, and any plan which might result in a greater volume of bonds being offered for sale can only further depress the market.

Eventually enough taxes will have been paid in to reduce the debt of the United States and reduce the available supply of government bonds for investment, and this operation, together with cheaper money, will do the trick that hundreds of "short-cutters" would like to perform.

Suspicion and Sales

MEN who espouse publicity know no limits. They proceed on the general proposition that the "light of day" works for ultimate good in every case. But here and there one runs across fellows who cannot be classed even as moderate publicists, and it is from them that one hears the familiar argument, "we are a closed corporation" and "we do not believe in advertising our gains or our losses." But these friends will subscribe to the proposition of giving the customer plenty of information about the product offered for sale.

A certain friend in the close corporation class will no doubt be interested to learn that he lost quite a considerable sale of goods last week because a prospective purchaser was unable to obtain any information about the finances of the producing company. Nowadays, more than ever before, nobody wants to buy a car or a truck that he suspects may some day be an "orphan." A car may be the finest and prettiest but the finances of the producer may be within twenty-four hours of bankruptcy, and if the producer hangs to the old-fashioned plan of refusing reasonable publicity, he should not be surprised if there is lack of confidence on the part of some of his prospective customers.

It were much better to let the prospective buyer in on an unsatisfactory state of affairs than to inspire suspicion and rumor of conditions far afield from facts. And letting friends and customers and creditors in on the facts does not mean sensational stock market movements. It is a fact that everyday experience in Detroit demonstrates that there is more juggling of stocks of companies which withhold information than there is in those which make it a practice to give the public frank reports of condition. The discriminating purchaser should be afforded the means to judge for himself whether he is buying an "orphan" or whether his car will have a guardian the rest of its natural life.

Short Measure Stuff

YOU NEVER CAN TELL

I'm thankful that the sun and moon
Are both hung up so high
That no pretentious hand can stretch
And pull them from the sky.
If they were not, I have no doubt
But some reforming ass
Would recommend to take them down
And light the world with gas.
—John M. Eaton, in the Weekly Bulletin.

And yet, my friend, one never knows,
When some resourceful gent
Will pick the sun and moon and stars
From out the firmament.
They sold blue sky for stocks and bonds,
The deals were pretty raw,
And now they're taking Heaven's blue
And making Sunday law.

Must have been pleasant to watch.

* * *

DEMPSEY VS. CARPENTIER

Now that it's really coming off,
In some spot quite a way from here,
There'll be a lot of talk on how
To sound the name of Carpentier.

Your doughty foreigner will claim
It proper to harp on the "a,"
And let the name roll off the tongue
Like this: Gay-orr Carr-pon-tee-a.

And some who use the English tongue
Without the aid of book or mentor,
If argued with will tell the world
The right way is to say Car-PEN-ter.

Still many more will speak of him
As if he worked with saw and burr;
And nailed together houses for folks
Like any union Carpenter.

But all the dead game sports will grunt,
And say, "I'l really makes me sick;
The thing to call this Frenchman is
"That guy wot Dempsey's gonna lick."

FINANCIAL

By PHIL S. HANNA

IT IS UNFORTUNATE that a man like B. C. Forbes should fall into the error of hasty conclusion. We do not know, of course, if he is responsible for the heading "Bankers Thrive, Industry Wails," which appeared over his letter of April 7 in the Detroit Journal, but we do know that Mr. Forbes concluded hastily when he assumed that a rising Federal Reserve Bank ratio is a positive signal for loosening credit restrictions. Here are the figures of the combined Federal Banks of December 30, 1920, and April 8, 1921, upon which reserves are figured:

Dec. 30, 1920, total gold	$2,059,333,000
April 8, 1921, total gold	2,264,010,000
Gain	$ 204,677,000
Total deposits	$2,948,844,000
Total deposits	2,651,301,000
Loss	$ 337,543,000

Naturally with a dropping off of about 11 per cent in deposits and a gain of about 10 per cent in gold, the ratio of gold to deposits will rise from 45 to 52½, as it would rise to 100 per cent if deposits dropped down far enough to be equal to the amount of gold in the Federal Banks. The point Mr. Forbes missed is that the reserve ratio in not a true index of the member banks' loanable funds. The ability of any bank to lend money rises or falls with the rise or fall in deposits, and loans must be paid as fast as deposits fall. The official figures of the Reserve Banks show total deposits (including deferred items and uncollected items) fell off $337,543,000 between December 30 and April 8, whereas during the same period loans and investments were paid off to the extent of $725,424,000, of which $204,677,000 is represented by a gain in gold.

Admittedly the figures prove a remarkably favorable improvement in the position of the Reserve Banks, taken as a whole. But let us bear in mind that the deposits in the Reserve Banks represent merely the legal reserves of the member banks and in no sense are they a conclusive guide as to the ability of the member banks to take on new loans. The gain in gold is a gain in strength of the Reserve banks, due, not to eased credit conditions in 1,001 smaller cities, but, in the opinion of competent observers, more to the fact that Europe is sending gold to this country rather than suffer exchange discounts. The reduction in loans and investments of $725,424,000 shows that the member banks are liquidating their borrowings but in so doing their own reserves went down $337,543,000.

In order to prove that "the necessity for curtailing loans is long past due," one must look into the condition of his home banks for positive conclusions. Let us take the Detroit banks for example. In the week between March 31 and April 7 deposits decreased $3,967,000, while the banks increased their borrowed money obligations $5,975,000. Between December 30 and April 7 deposits dropped from $407,000,000 to $375,000,000 without a corresponding reduction by borrowers of their loans. Neither of these exhibits would lead any sane man to conclude that Detroit banks were in position to take on new loans.

Having noted the Detroit situation, let us look at the banking situation elsewhere, and study the figures reported by 830 large banks located in various parts of the country:

	Loans and Investments	Deposits	Borrowed Money	Cash and Reserve	Ratio of Borrowed Money to Loans and Inv.
Oct. 1, 1920	$15,082,434,000	$14,298,972,000	$2,184,491,000	$1,484,000,000	14.6%
April 1, 1921	15,902,713,000	13,821,565,000	1,685,313,000	1,363,575,000	10.6%
	+820,279,000	−477,407,000	−499,178,000	−120,425,000	−4.0%
	−3,241,673,000	−777,407,000	−459,136,000	−131,133,000	−2.0%

It will be noted first that the reduction in loans and investments is approximately equal to the drop in deposits and borrowed money obligations combined; and second, that cash and reserves have not fallen in exact relative proportion, the percentage of cash and reserves October 1 to deposits being approximately 12 per cent and the same percentage April 1, being about 11½ per cent. Had cash and reserve increased in proportion to deposits it would be perfectly normal to assume that these 820 banks, taken collectively, were building up reserves by refusing credit to their borrowers, and Mr. Forbes' statement that the time to loosen up had come would be justifiable. But the fact is, as the figures plainly show, in spite of the splendid improvement, that more than 10 per cent of the loans and investments represent borrowed money, which condition is not by any manner of means an indication that the reducing process should be stopped.

Moreover, even on April 1 the total of borrowed money was $112,000,000 more than cash and reserve. There is much improvement in this respect, for on October 1 the difference was $475,000,000 the same way, but a well managed business institution having current liabilities in excess of current assets would not think of showing caution to the widest under these conditions and it is the more unthinkable that public men should propose a less measure of caution for our banks so long as quick liabilities remain warped out of line with reserves.

All of these proposals to short-cut the hard road merely slow up recuperation. They create false hopes in the hearts of those who are not clearly informed as to the facts. What the country needs most today is a law against financial Don Quixotes and another law requiring a more intensive study of arithmetic.

New Corporations

Note—Owing to an unavoidable delay at Lansing this week's list of new incorporations did not reach the editors in time for insertion in its regular position. It therefore appears in the financial section, which "closes" last. On Page 34 will be found the list mailed out weekly by the Secretary of State, which was used in the belief that the Manufacturer's tabulation, which is especially prepared by the paper's Lansing correspondent, Mr. Bliss, would not be available. Readers will note the much greater detail of the accompanying list.

For Week Ended April 9, 1921.

Grand River Brookline Co., Detroit; buying and selling real estate; to purchase property for subdivision purposes and sell same; incorp. A. Marshall, 1409 Elmhurst ave., Stephen F. Cheney, Robert C. Jackson, Detroit ..... $ 750,000

Munger Power & Light Co., operations in Merritt township, Bay county; office at Munger; production or supplying of electricity, power, lighting, fuel and other purposes to the public; Edward Schreiber, A. J. Schabel, Gustav Gellin, Munger.. 8,000

Art Metal Construction Co. (F.) James-town, N. Y., E. O. Hultquist, 551 Book bldg., Detroit 6,000,000

P. Russell Co. (F.) Tulsa, Okla., Mark S. Walker, 306 Majestic bldg., Detroit .. 414,894.50

Friedhorn Construction Co. (F.) Wilmington, Del., Earl J. Hoffman, 353 Ford bldg., Detroit ..... ——

Howland Battery Co., Detroit, manufacturing and selling storage batteries and battery accessories; Joseph I. Cox, 6536 16th st., Loren W. Brumitt, George A. Howland, James Romas, Detroit ..... ——

Attwood Brass Works, Grand Rapids; to purchase, manufacture, assemble and sell brass and other goods; Charles F. Attwood, Charles E. and Lillian E. Attwood, Grand Rapids.. ——

Trudell Fisheries Co., Tawas City; to fish, buy, sell, and deal, engage in business of fishing; Louis and Edward A. Trudell, John Cope, Tawas City ..... ——

Grand Ledge Lumber Co., Grand Ledge; to deal in lumber; Levi Marshall, Archibald H. Wright, John M. Marshall, Ionia 26,000

Sunica State Bank, Sunica; commercial and savings bank; Abraham Lincoln Lawrence, Agnus Erhorn, John Henry Ahrens, Sunica 20,000

Altenet Hotel & Sanitarium, Mount Clemens; to carry on institution for treatment of disease and instructions in hygiene; C. A. Allen, Dr. C. H. Burton, Charles H. Gatz, Mount Clemens 100,000

Mud Creek Thresher Co., Bay Port; buying, selling and dealing in clover hulling; L. A. Notter, Pigeon; Allan A. Wilfong, also trustee, Bay Port 5,000

Robert Stephenson Land Co., (F.) Milwaukee, Wis.; Gustavus A. Bloch, Menominee 100

Rexford Harvey Trading Corp., (F.) Wilmington, Del., Rexford Harvey, 117 Congress st., W., Detroit 1,000,000

Sperlich & Uhlig Co., Detroit; to manufacture, buy, sell and deal in electrical appliances, equipment and devices; Herman A. Sperlich, 11 Colorado ave., Hilda M. Parks, 12 Herman Uhlig, Edward F. Wunch, Detroit.. 300,000

Caverley Iron Works, Detroit; contractors, manufacturers and setters of structural steel, ornamental iron work, etc.; Hattie J. Caverley, 3177 Garland ave., E. Merrill Hesser, Harry J. Caverley, Detroit 25,000

Detroit Auto Fuelizer Co., Detroit; manufacturing and selling automobile accessories, particularly improved type of fuelizer; John Farkas, 3256 Hunt ave., Peter H. Griesser, Andrew Horsch, Detroit.... 20,000

Ravenna-Conklin Electric Light & Power Co., Ravenna; to generate electric current for light and power purposes by water power or other means and to sell same; John A. Currie, Frank E. Thatcher, Tom F. Rogers, Ravenna 120,000

Flint North End Groceries Assn., Flint; buying and selling of groceries, meats, flour and other merchandise used in small retail stores; Sam Kotwicki, John Kroslicki, Stanley Niedzielski, Flint 6,000

Harding White Brothers & Ripley, Inc., Muskegon; to engage in general building, contracting and construction work and all matters incidental thereto; J. Frederick Harding, Clifford J. Ripley, Muskegon; Orval C. White, Muskegon Heights 10,000

Lamping Milling Co., Ludington; to manufacture, buy, sell and deal in grain, flour, feeds and grain products, Luman W. Goodenough, Farmington; Harry McRae, Vaughan Kilpatrick, Detroit 10,000

Diebold Safe & Lock Co., (F.) Canton, O., C. F. Walker, Detroit, manager.. 180,000

Auto Inn Building Co., Jackson; erection of building for offices, storage purposes, salesrooms and general repair; Louis C. Watkins, Grass Lake; Rayner Field, Royal W. Conswell, Jackson 50,000

Quotes by Howe, Snow, Corrigan & Bertles, April 12.

ROBINSON GETS MICHIGAN DISTRICT

E. Robert Robinson, who recently was appointed a national bank examiner, has been assigned to the Michigan district, with headquarters at Grand Rapids. Robinson was connected with the Grand Rapids National City Bank at one time and before receiving his recent appointment was a state bank examiner.

Who Will Divide Your Estate?

Some day your estate will be divided. At that time one of two things will happen.

Either the division will be according to the terms of a will which you have made—

—or the division will be according to state inheritance laws which may or may not fit your family's needs.

It is your duty to your family to make a will now; it is your duty and privilege to name a thoroughly responsible executor in that will.

A trust company is the best executor for—unlike an individual executor, it never dies—never falls sick—never fails from lack of experience.

The Union Trust Company adds its 30 years of experience to the many good points of a trust company as executor.

It will do for your family what it has done for hundreds of others—it will see that the terms of your will are faithfully and effectively carried out.

A phone call or a letter will bring literature which you will find most useful in solving your problems.

Union Trust Company

First trust company in Detroit

Banks and Bankers

GORMAN MADE LANSING CASHIER

Frank E. Gorman, state treasurer, who has been connected with the treasury department fourteen years, has been made cashier of the Capital National Bank, Lansing. Mr. Gorman will continue to act as state treasurer during the remainder of his term. Robert V. Speir will continue as vice-president of the bank, with the added title of manager. Albert A. Elsesser, who has been handling the bonds and credit files, and Marshall A. Westfall, auditor, have been named assistant cashiers.

DETROIT GETS GUARANTEED TITLES

Stockholders of the Union Trust Company, Detroit, have organized the Union Title & Guaranty Company, which has acquired the records, equipment and business of the Union Trust Company abstract department. The new company will render a guaranteed abstract and title service to Detroit, a title protection which few cities outside of New York and Chicago now enjoy. The principle of operation is that like insurance. For a small fee the company guarantees title to property and relieves owners of worry about possible loss on account of faulty prior conveyances. The management will be the same as that of the abstract department of the trust company and will be in charge of I. T. Cowles and his assistant, H. D. Hahn.

NEW VAULTS ABOUT COMPLETE

The new vaults which have been in process of construction the last few months for the State Bank of St. Johns are practically complete and shortly will be ready to use. Fifteen tons of steel and 88 barrels of cement were used in the construction and the stronghold is now on a par with many of the larger banks. This improvement is preliminary to a complete remodeling of the bank, which will be completed before fall. Plans call for a new stone front. M. M. Weller is president and F. L. Thome cashier.

PONTIAC CLEARINGS GAIN

For the five days ended April 7 Pontiac bank clearing totaled $368,679.02, a gain of more than $100,000 over the previous week, when totals were $256,856.33.

G. R. RAILWAY EARNINGS

According to the annual report of the Grand Rapids Railway Company, submitted to City Manager Locke, net income for the year ended December 31, 1920, was $147,920.26. Gross earnings were $1,804,293.32, operating expenses $1,338,312.68 and fixed charges $613,050.90. Bills payable were $736,578.23. Reproduction cost is given as $8,382,553, with encumbrances of $3,700,000. The last preferred dividend was declared Novemb.r 1, 1918, and the last common March 1, 1919.

NEW BRITISH TARIFF

According to advices from London Great Britain will soon apply a duty of 33⅓ per cent on scientific instruments, optical glass, hosiery, magnetos, needles, metallic tungsten and synthetic chemicals. And a further duty of 33⅓ per cent may be added to other articles articles offered for sale at prices below cost of production, or at prices which because of currency depreciation are below those at which similar goods can be made.

FISHER OHIO BODY PASSES DIVIDEND

It is reported that action on the preferred dividend on Fisher Ohio body stock has been deferred until such time as the common stockholders of the company have indicated their acceptance or refusal of the Fisher Body Corporation exchange offer. It is stated that about 30,000 of the 40,000 shares of Fisher Ohio Body common required to make the exchange effective have been deposited and that the preferred dividend will be payable just as soon as the exchange becomes effective.

Who's Who In Michigan Finance

Harry L. Brimmer, Cashier of the First State Bank of Petoskey

THERE'S something in the atmosphere of the west shore of Michigan that seems to make the younger bank employes get ahead rapidly. The latest addition to the ranks of rising northwestern Michigan bank officials is Harry L. Brimmer, who became cashier of the First State Bank of Petoskey by action of the board of directors at the March meeting.

H. L. BRIMMER

Mr. Brimmer put in six years as accountant to the superintendent of steamships of the Pere Marquette Railway, at Ludington, and went to France with the Eighty-fifth Division in July, 1918, where he served a year. Upon being discharged from the army in the fall of 1919, he joined the First State Bank of Petoskey as commercial teller, which position he held until Chester D. Masters resigned. He was then appointed assistant cashier, and now has been advanced to the cashiership.

The First State Bank of Petoskey has had a splendid growth, as is evidenced by total resources of $937,343.54, February 21, 1921, compared with similar totals of $723,815.99 on February 21, 1918. Capital, surplus and profits were $84,500 and total deposits $849,843.49.

The bank takes pride in its slogan "First bank to incorporate in Emmet county."

Michigan Bond Items

Lansing voters last week passed favorably on the issuance of nearly a million dollars in bonds for sewers, paving and bridge construction, but failed to give the required majority to bonds for a fire station.

The latest issue of Detroit city bonds, bids for which were opened Saturday, April 9, are being offered by the successful bidder, which is a syndicate comprising the following: Guaranty Company, Harris Trust & Savings Bank, E. H. Rollins & Sons, First National Company, National City Company, Bankers Trust Company, Detroit Trust Company and Keane, Higbie & Company. The total issue is $13,573,000 and the bonds are issued in various maturities and at different rates of interest, 5, 5¼, 5½ and 6 per cent. The bonds are issued for bridge, sewer, hospital, park and general improvement purposes. According to the announcement, the net bonded debt with this issue included is less than 3¼ per cent of an assessed valuation of $1,693,007,720, with water debt and sinking funds deducted. The charter of the city provides for a net debt not to exceed 4 per cent. Prices have been set which give purchasers a yield of about 5.75 per cent for the 1922 maturities, running down to 5.20 per cent for the 1941-51 maturities.

Fifty thousand dollars of Michigan highway improvement bonds due in 1925 are being sold by Watling, Lerchen & Company, Detroit. The denominations available are $1,000 and the price is on a 5.80 per cent basis.

A mild stir was created early in the week by the announcement of the Detroit Mortgage Company that for a limited period it would offer its first mortgage real estate bonds at prices to yield the investor 7 per cent. Heretofore 6 per cent has been the ruling rate with the majority of the mortgage companies.

THE OLDEST HOUSE IN MICHIGAN

BONDS—THE SAFEST FORM OF INVESTMENT FOR YOUR SAVINGS—We have a bond secured by a first mortgage on properties worth *six and one-half times* the entire outstanding issue. The yield is 8¾%. Such an investment combines safety with high interest on your money. Descriptive circular on request.

PACKARD REDUCES INVENTORY

The balance sheet published in connection with the offering of $10,000,000 Packard ten-year 8 per cent notes presents an interesting comparison with the balance sheet of August 31, 1920. Quick assets on February 28 were $36,254,000 against current liabilities of $13,464,000 and inasmuch as it is stated that the proceeds of the notes will go to redtice bank loans, the new financing will not materially change this relation. In comparing this statement with that of August 31, 1920, there will be noted a decrease in surplus account of $2,640,000 which is accounted for by a reduction in the inventory account of $2,500,000. On the other hand plant account has been increased about $2,600,000. The balance sheet follows:

ASSETS

Current—	Feb. 28, '21	Aug. 31, '20
Inventories, less reserve	$24,276,263	$29,369,227
Cash	5,844,323	4,314,809
Accounts and notes	6,134,497	6,234,917
	$36,254,986	$39,909,054
Plant	$24,546,000	$21,936,423
Incompleted development	390,211	
Patents, etc.	1	
Securities and investments	432,375	297,635
Deferred charges	231,010	703,257
	$61,966,883	$62,803,276

LIABILITIES

Current—		
Accounts payable	$ 536,890	$ 4,087,549
Accrued & matured interest	1,811,133	2,334,465
Notes payable, banks, etc.	10,800,000	5,000,000
Customers' deposits and miscellaneous	316,021

Surplus	31,117,323	30,787,772
	$61,966,803	$62,803,276

*Book value $26,776,263, less $2,500,000 set aside for depreciation.

†Includes miscellaneous liabilities.

BANKERS' CONVENTION DATE SET

The thirty-fifth annual convention of the Michigan Bankers Association will be held Monday and Tuesday, June 6 and 7, 1921 at the Hotel Statler, Detroit. Secretary Brown advises that the convention days will enable delegates who arrive on Saturday and Sunday a splendid opportunity for sight-seeing and recreation, and that the ladies are cordially invited. Every bank officer and director is eligible.

McGILL JOINS MT. CLEMENS SAVINGS

H. J. McGill, Port Huron, for the last two years a state bank examiner, has become cashier of the Citizens Savings Bank of Mount Clemens. W. H. Flory, heretofore cashier, is advanced to a vice-presidency.

KALAHAR GOES TO HARBOR BEACH

B. A. Kalahar, formerly of Frederick, where he was cashier of the Frederick Bank of Dismore & Kalahar, has become cashier of the State Bank of Harbor Beach. For the last eighteen months he has been a state bank examiner. Roy Bricker, formerly cashier of the State Bank of Harbor Beach, has removed to another city to take a bank position, but the details are not available at this time.

Miscellaneous Finance

SUPERIOR STEEL EARNINGS

The Superior Steel Company reports earnings of $857,320 in 1920, after deductions for charges, sinking fund and federal taxes. The balance after providing for dividends on the first and second preferred stocks was equal to $8.92 a share on the 60,000 shares of common stock, compared with $7.90 in 1919.

STUTZ COMPANY BALANCE

The Stutz Motor Company's balance sheet December 31 shows total assets of $8,032,522 and surplus of $5,404,414, compared with total assets of $7,404,352 and surplus of $5,772,958 on December 31, 1919.

MOTOR PRODUCTS DIVIDEND

The Motor Products Company, Detroit, has declared a quarterly dividend of $1.25 a share on the capital stock payable May 1 to owners of record April 20.

PENNSYLVANIA RAILROAD INCOME

Gross revenues of the Pennsylvania Railroad Company in February were $37,506,974, an increase of $2,729,512 or 7.8 per cent compares with the similar month of last year. Net operating deficit after deduction of expenses was $2,577,081, a decrease of $7,651,839 or 74.8 per cent compared with February, 1920.

LANSING CREDIT MEN ORGANIZING

A credit association is being organized in Lansing to be affiliated with the National Association of Credit Men, and a $10,000 stock company is under way in this connection. It is expected that this stock will all be subscribed within a week, when a meeting of the stockholders will be held and officers elected. The credit association will be under the management of six executive committee, which will retain a paid manager and assistants.

DISTRIBUTING MAPS

Fenton, Davis & Boyle, Detroit bond dealers, are distributing a useful Rand-McNally map of Michigan which carries their striking slogan: "An excellence of service in a business of better bonds."

P. M. STOCKHOLDERS INCREASED

Owners of common stock of the Pere Marquette Railway on January 1, numbered 2,860, against 2,853 a year ago and 1,920 on January 1, 1919.

GRATON & KNIGHT ANNUAL STATEMENT

ASSETS	Dec. 31, 1920

Surplus after allowances for adjustment of plant values	3,929,862.62
	$20,655,188.20

Note: *Cash and accounts receivable include amounts owing from foreign fires and balances shown are after allowances for loss due to exchange.

*Manufactured products, etc., are at cost or market, whichever lower, and are carried in the statement at $2,299,721 less than cost values as shown by company's records.

President W. M. Spaulding says in part: "Without entering into a discussion of the many diversified causes of the stagnation in the business, it is sufficient to state that we have rounded out the year with the sales of this corporation by far the best in its history, with the single exception of our war contract period in 1918, and ended the year in strong financial position. It is gratifying to note that irrespective of the large depreciation in inventories, net decrease in surplus, after payment of dividends of $790,028, is only $1,302,212.15. January, 1921, has shown considerable improvement over December and February and March up to date a still further improvement."

Graton & Knight are one of the foremost manufacturers of belts and other leather products in the United States, and control the following subsidiary companies: Graton & Knight Inc., Atlanta, Ga.; Graton & Knight Mfg. of Wisconsin; same of California; same of Texas; Belting & Leather Products Association, New York; Bickford & Francis Belting Co., Buffalo, N. Y.; Bradford Belting Co., Cincinnati, O.; Canadian Graton & Knight, Ltd., Montreal; William Coupe Corporation, South Attleboro, Mass.; Dickey Belting Company, Lewiston, Maine; Graton & Knight, Ltd., London, Eng.; E. B. Ladew Company, Inc., New York; New York Leather Belting Company; Shultz Belting Co., St. Louis, and United States Oil & Supply Co., Providence, R. I.

CITY TO PROVIDE JOBS

By using double shifts on the re-surfacing work to be started May 1, Detroit will be able to employ about 2,500 men. The construction of Municipal Railway lines will employ another 2,500.

Purchasing Agents' Association of Detroit, recognizes that business confidences should not be violated, and never permits this at any meeting.

The Kelly-Springfield Tire Company has omitted the regular quarterly cash dividend on the common stock, but has declared the other regular dividends.

The Northern Pump Tool Company has passed action on the common stock dividend due at this time.

The United States Smelting, Refining & Mining Company has passed the quarterly dividend on the common.

Directors of the Punta Alegre Sugar Company have reduced the quarterly dividend from $7 to $1.75 a share.

The American Beet Sugar Company has passed the dividend on the common stock, making the following announcement:

"The high figure paid to the farmers for beets, based as per contract upon the average ruling prices for sugar during the year has been the greatest factor in augmenting the cost of the sugar produced, resulting in a slight profit only for the year ending March 31, 1921. The financial condition of the company is thoroughly sound."

The Midvale Steel & Ordnance Company has passed its quarterly dividend of 75 cents a share.

The Crucible Steel Company of America has declared a dividend of 2 per cent on the common stock, to be paid from undivided profits.

Public Utilities

Grand Rapids—The State Supreme Court has issued an order requiring the Michigan Public Utilities Commission to show cause why it will not undertake to fix gas rates in this city. The commission refused to act on the petition of the citizens and its position was approved by the attorney-general of the state. The franchise under which the company was operating has expired and the Grand Rapids Gas Light Company has increased its rates to $1.50 on its own authority.

Detroit—The Michigan Manufacturers' Association has gone on record as favoring the Osborn bill, which would put all the state utilities under the control of the Michigan Public Utilities Commission, Detroit being the one exception. By this move it is hoped to pave the way for rate increases needed to make the utilities going concerns.

Lansing—The Michigan Public Utilities Commission has reduced the telephone rates for hotels 15 per cent. The Commission when it took charge found that many hotels obtained unusually low rates and increased them 125 per cent. Protests resulted in the present cuts.

Growing Two Bonds Where One Grew Before

(*Continued from Page 8*)

slumped no doubt there is much of it left and they are putting their money into remittances back home, hoarding much of it and entrusting much of it to their countrymen who run private banking enterprises. And no niggardly amount is going into real estate and blue sky investments. Why not open a branch office in Hastings street or Gratiot avenue in charge of a foreigner but assisted by one of your own boys? The banks invaded this field successfully and the banks and the foreigners themselves are both better off by the arrangement.

Moreover, Detroit has an annual crop of newcomers, many of whom, judging by some of the letters received in our office, have never been solicited to buy bonds. To get into touch with these people I would suggest getting information from the moving van people, from church pastors, from lodges and clubs and college alumni associations. There is never a time when a newcomer to town is so easily approached as upon his arrival.

It strikes me also that the bond men could combine for the purpose of spreading investment propaganda. Nearly every modern line of business keeps a constant stream of advice, education and invitation running to prospects whom it considers may become ultimate customers. I would like to see more ground floor offices, without screen and curtains which give one a feeling that he is passing a morgue, and the business popularized so that people will know as much about bond houses as drug stores.

But no consideration of the future bond market can be discussed very satisfactorily without going to some extent into the general business outlook. I think we all agree that the growth of any bond house depends on a steady increase in the aggregate of liquid wealth in the country, and it is difficult right at present to see any considerable increase in the conversion of property wealth into money wealth notwithstanding the enormous surplus of property wealth now in the hands of the American public. Exchange of goods for goods makes for prosperity but does not make business for the seller of securities. Dr. Lichtenstein, of the First National Bank of Chicago, has figured the surplus of crops, ores, goods and commodities of all kinds produced by this nation to be about $8,000,000,000 more than our normal consumptive power, and if some means could be devised to put this surplus into the hands of purchasers outside of the United States, it undoubtedly would add to the prosperity of the nation and incidentally help the bond business.

Now the suggestion I have to offer in this matter may not strike everyone as practicable but when one is miles from town an finds himself running out of gasoline he will entertain many suggestions that would not be considered if he were standing in front of a filling station, and the substance is as follows: Why could not the Investment Bankers' Association act as a medium through which the surplus goods and crops of this country could be exchanged for long-time notes of desirable foreign purchasers? If a farmer's surplus has to go to waste he might much better exchange it for a one, two or three note of a purchaser in France, even though the latter is a poor risk at present. And a factory with piles of goods lying in stock might likewise dispose of part of its unsaleable surplus. Eventually the notes of the French purchaser will be paid and at that time the holders on this side will have money for investment. And if the bond dealer is the chief factor in turning unsaleable goods into money, it strikes me that he will have made a customer of the holder of the notes.

With some refinements in the process, this exchange of our surplus goods for long-time notes of the foreigner is precisely what the new $100,000,000 foreign trade bank proposes to do.

Looking further into such a proposal I can see prospects of a broad market for the notes so taken in exchange for goods. In the event of cheaper money and the creation of such a market you as a bond dealer could go, for instance, to a farmer who has taken such notes and trade him some of your own issues. The manufacturers who have obtained such paper in exchange for their surplus goods are certain to let them go as soon as a market appears.

But the crowning advantage of the successful working out of the plan is the favorable effect on the business of the United States. Just picture in your minds, if you will, the energizing effect on both parties to the transaction if some giant over night could remove from our granaries and our warehouses all our surplus goods and place them in the hands of the foreigners who so badly need them. It seems easy to picture the revival of business over there, the return of confidence and the widespread employment, which a loan of such goods might result in in Europe, where-

FOR the first time in the financial history of Michigan a Bond House of the magnitude of this Corporation offers First Mortgage Bonds at a price to net 7%.

We feel that this is the best investment offering ever made in Michigan. You may now purchase a serial Gold Bond—a unit of a direct closed First Mortgage secured two to one by Detroit improved property—to produce 7%.

These bonds have been selling on a 6% basis.

Considering the collateral security, the tax exemption features, and the unqualified guaranty of this $7,000,000 Corporation—we feel justified in stating that at 7% these bonds are unexcelled.

UNITED FUEL & SUPPLY CO.
BUILDING SUPPLIES & COAL

as on this side of the Atlantic we would have occasion to commence in earnest the production of another surplus to send over next year, and sell largely for cash.

It seems certain, on the other hand, that unless this nation does accomplish the exchange of its surplus property wealth for some form of money wealth, within another crop year we shall be as poor as regards liquid wealth as the man who is "land poor." We shall in fact be property poor, which means an entirely different form of living, and there is not one man in ten who is willing to go back to that age when we were broken up into small units, taking from the land merely what we needed to clothe and feed ourselves, and paying little or no attention to exporting a surplus. That system does not spell growth in bond sales or much growth in anything but in the number of small farms which would be necessary to preserve the equilibrium between producer and consumer.

But after summing up all the suggestions offered in this dissertation there is one method of increasing business which is always applicable to your problem, and that plan involves a liberal use of the product of two of America's foremost manufacturers: Fleischman's yeast and O'Sullivan's rubber heels.

Boring Mill Operation

(*Continued from Page 8*)

been roughed is being reamed under a second set of spindles at 4 thus finishing the cylinder bore.

There are similar multiple spindle boring machines for machining the openings for the valves. In this case there are two spindles for each cylinder, so making a pretty busy machine.

Choosing Your Boring Machine

The boring mill and the boring machine have never been cheap machines and never will be. They have a long life if properly cared for and the good ones are exceedingly accurate.

Unless the moderate sized shop is one working on standard stuff in quantity, it is ordinarily poor judgment to have more than one of the same size. If there is already in the shop one of those versatile large machines, even if it does not have all of the most modern features, the machine to install is a small high production machine. Similarly, if there are a series of small high production machines with occasional work which is so large as to strain them, the installation of a larger, more versatile machine is indicated.

The modern machines have been very carefully elaborated. They have made provision for getting the utmost out of the modern tool steels and by the addition of further heads, turrets, or by making them available for other kinds of work, have largely increased their productive capacity.

It is possible to buy the simple machine, with but few attachments and a comparatively limited range of work, or very highly specialized machines. Some have been manufactured for many years. Others have been put out recently. It will pay to inquire carefully among users to find out how well machines in customers' hands are doing and what their drawbacks are before purchasing, because they cost much money and they earn dividends only when producing.

When purchasing a horizonal boring machine for making jigs it is essential to select the most accurate, rigidly made, long lived one that can be bought. The percentage difference in cost will not be very great and will soon be made up by savings in tool room manufacturing and assembly time.

Motor Car Price Situation

(Continued from Page 4)

tice of making other than market values on used cars.

"In your letter you quote that a number of automobile dealers, when asked their opinion regarding price reduction, stated that this did not bring more business. I am sure that most dealers have confronted the same class of people that we have, and I am willing to go on record as saying that price reduction will certainly increase business.

"The public are looking for it and the sooner this adjustment is made the quicker the confidence of the people will be established. I do not wish to be misunderstood, however, and will explain that I do not believe that any one or two or three manufacturers, in establishing their prices, would have effect, but I do believe that if all manufacturers who have not already readjusted their price list would do this, there is no question in my mind what results would be very beneficial."

H. Krohn, vice-president, sales division, Paige-Detroit Motor Car Company, Detroit—"It would seem to the writer that everything depends upon the demand and the sale of motor cars.

"Conditions are improving and if they continue to improve and motor car manufacturers are doing a fair business it would be ridiculous, regardless of the possibilities of reduction, to cut prices, because they are well aware of the fact, and they had a good sample last fall, that the public does not buy on a falling market.

"There is, of course, always a likelihood of some manufacturer, because his own particular condition isn't satisfactory, getting excited and making a cut, believing that will stimulate his business. I do not think that holds good with the old line, large representative manufacturers, but rather with the smaller manufacturers who are not thoroughly organized."

R. E. Gardner, Jr., vice-president for sales, Gardner Motor Company, St. Louis, Mo.—"We are one of the companies that reduced their price last October, making a cut of $100. This reduction was in no way justified, as since that time we have been doing business at less than cost. We figured, however, that in a reconstruction period it is necessary for everyone to take their loss one time or another. We decided to take ours at once and have it over with. Our high priced inventory has now been absorbed and we are working on lower priced stuff.

"I think probably those companies that did not reduce their price but guaranteed it instead until June or July, will make some reductions. The ones that have already reduced, I do not believe can hope to make further reductions during 1921.

"I do not believe that the price reductions this summer will bring any more business, even to those making the reduction, and I feel quite sure it will unsettle the entire situation again and will do more harm than good.

"From our standpoint, we would much rather have all prices remain at their present status until late in the fall or early spring. We know, as far as we are concerned, there will be no change in our present price for this year, unless some very unusual circumstance, which cannot be foreseen at this time, should occur.

"We find our business increasing every day—particularly in the northern and eastern sections and along the western coast. This quarter will be a distinct improvement over the last quarter of 1920, and from present indications the second quarter of this year should develop business double that of the first."

S. A. Dwight, Grand Rapids, distributor for the Auburn and Crow-Elkhart passenger cars and Tower trucks—"Relative to price reduction of automobiles, will say that I do not think this would be a wise move at this particular time. Of course the cars that I am handling have already been reduced. Business always seems to be poor on a declining market. Think that the prices should have been reduced on many of the makes some time ago, but, of course, this is my personal opinion only."

H. R. Williams, general manager, M. A. Young, Detroit, distributor for the Peerless and Chandler—"We believe it would be impossible for any of the automobile manufacturers to reduce the price of their product at this time. The demand for more cars is increasing daily, and we believe the period of depression is over.

"Most manufacturers have reduced their prices during the depression and have stood considerable loss by so doing. They would therefore be unable to reduce the prices further at this time. It would not stimulate buying, but rather hold the conservative buyer up until prices are settled.

"We believe the automobile manufacturers appreciate these circumstances and do not consider further price reduction for some time."

W. J. Doughty, Detroit, distributor for the Franklin—"Regarding the price on automobiles being reduced, can only speak from our particular product and the way things have worked out with us.

"Beginning last fall, there was an undoubted buying depression. The H. H. Franklin Manufacturing Company took measures to counteract it. The principal thing was price reduction and an extensive selling campaign to spur the sales force throughout the United States on to better efforts.

"This action increased sales from about sixteen cars a day in the United States until at the present time they are building fifty cars a day at the factory and are about 1,500 cars behind on orders. They are loading cars that are exactly three hours old, which shows you how close the sales are to production.

"Ninety per cent of prospective purchasers of automobiles to whom our salesmen talk are of the opinion that prices are too high. I personally agree with them that the prices of most automobiles are entirely too high, and think that a general reduction in price would be beneficial to automobile sales."

E. T. Strong, general sales manager, Buick Motor Company, Flint—"No revision in the prices of the 1921 Buick models is warranted and, furthermore, we see no possibility of a price revision during the life of the present selling agreements with our trade. This announcement is based entirely on manufacturing conditions as they exist today and are likely to continue to exist during the current season.

"Buick cars have never been built to a price. We have never attempted to learn what a certain class of motorists would pay for a car and then to supply that car at a profit. Rather we have endeavored to build a car that would meet the average discriminating buyer's need for dependable, comfortable, economical transportation and to arrange prices in strict accordance with the most careful analysis of production costs.

"We are still maintaining the contracts we made for the delivery of raw material, which we know to be of the quality specified last fall. We have broken no contracts in order to take the chance of buying cheaper material at lower prices.

"In other words, there has been practically no reduction in the cost of manufacturing Buick cars. And no reduction can be made

without the danger of jeopardizing the quality of manufacture, and, therefore, the quality of serviceability."

R. R. O'Hearn, director of sales, Crow-Elkhart Motor Corporation, Elkhart, ind.—"On September 24, 1920, we reduced the prices of all our models $200 and guaranteed these prices indefinitely. We are unable to speak for the manufacturers who maintained their former prices and guaranteed them against decline until May, June or July. In all probability those manufacturers will have to make a reduction at the expiration of their guarantee in order successfully to meet competition.

"As far as the material situation is concerned, we do not believe that this actually has much effect upon automobile price reductions. For the most part automobile manufacturers have simply been obliged to take a loss on cars sold at reduced prices and those familiar with conditions will honestly tell you that there has been no great reduction in the cost of materials.

"In the interest of good business it would seem very inconsistent for any publisher to advocate future price reductions in any commodity, when a united effort is being made to stimulate buying generally. We agree with you that a price reduction is not warranted. Any manufacturer who does so must take his losses the same as we have and it would seem to us that the automobile editor of any publication who releases this sort of "propaganda" certainly does not have the best interests of the automobile industry and good business at heart."

Taking the Salt Water Out of the Seamen's Act

(*Continued from Page 6*)

more than nines hours, in the fireroom as well as on deck.

Section 13 was changed to provide that certificated lifeboat men could be used in lieu of able seamen.

This change would make it possible for lake shipmasters to have members of their crews certificated as experienced and competent life boat men and eliminate the necessity of hiring additional men merely to wait for an emergency requiring ship abandonment, because they could not be used in ship management. Certificated lifeboat men need only to be physically qualified, able to understand orders and competent to handle either lifeboats or rafts. The port inspectors would be able to pass upon these men, of whom there are any number along the lakes who are not able seamen, but are as much at home in and on boats as they are upon land.

The amendment for Section 14, in effect, would lengthen the lake season by increasing the dates from May 1 to October 15. If it were not for the law, lake boats would be running as early as May 1 and as late as October 15, especially for the benefit of hay fever patients who visit certain lake localities late in the summer; for summer colonists who prefer to remain at their summer homes or resorts longer in the season, and for shippers of fruits and other food products who need the boats most after harvests.

It would qualify certificated life boat men for boats and rafts and make unnecessary the equipment of boats with 100 per cent lifeboat and raft facilities where these boats do not run more than ten miles offshore and where the depth of water would not be great enough to cover all the decks of the boats subject to the amendment. It would allow the vessels to carry boats or rafts for fifty per cent of the passenger and crew list and allow two-fifths of this equipment to be lifeboats and three-fifths rafts. Another clause provides that a licensed officer may be assigned to lifeboat or raft

(Continued from Page 32)

instead of an able seaman or a certificated life boat man.

After October 15 and until May 1 boats operating more than three miles off shore are required to carry a full complement of lifeboats and rafts for all passengers and crew, according to another provision of the proposed amendment to Section 14.

The plan of appealing to the state legislatures of the lake country for moral assistance through the adoption of resolutions protesting against the three sections of the law was offered by State Representative Milton It. Palmer, Detroit, who spoke at the last session of the conference on Saturday. Those legislatures now in session will be asked to adopt the resolutions drafted by a committee consisting of Capt. F. W. Fletcher, L. G. Macomber, H. E. Huntington, W. H. Croshy, H. C. Gardner, W. G. Norvell and J. E. Davidson. This committee also submitted the amendments.

In the absence of John A. Russell, president of the Board of Commerce, who is Ill, R. A. McLean, chairman of the Inland Waterways Committee, presided at the conference, and Tom L. Munger was secretary.

The resolution as adopted follows:

"Be it resolved by the House of Representatives of the State of Michigan, the Senate concurring, as follows:

"The existing laws of the United States governing the operation of vessels and the employment of seamen and others thereon, are in many respects unreasonable and constitute a great hardship upon many of the citizens of our state in the and laws put vessels plying the Great Lakes and their connecting waiters under the same control as vessels plying the high seas.

"These laws so far as they apply to vessels plying the Great Lakes and their connecting waters are too drastic and have caused discontinuance of ships and lines in many places. The most hurtful provisions of the law as they exist are:

"(a) They give officers of vessels too little authority over their men in face of danger.

"(b) Vessels plying upon short runs and along-shore runs are unnecessarily required to operate under the three-watch system.

"(c) The operating season is artificially shortened and should be lengthened to include at least from May 1 to October 15.

"(d) Unnecessary men are required upon many vessels adding to the expense of operation with the consequent advances in freight and passenger rates.

"(e) Even in emergency qualified officers of vessels may not take the place of able seamen. "We call upon Congress to reform the laws as applying to the operation of vessels upon the Great Lakes and their connecting waters so as to relieve the public from the effects of these and other hardships. This should be done immediately so as to bring relief during the present season."

Coal Mining Industry Suffering Severe Slump

Production of coal throughout the country continues to decrease. Every week in March showed a recession from the preceding week, and when compared with the corresponding weeks in 1920, the difference is as much as one third in some cases. Production of bituminous in March was as follows: Week of March 26, 6,412,000 tons; March 19, 6,506,000 tons; March 12, 6,800,000 tons; March 5, 7,278,000 tons. A year ago in March the average weekly output was more than 10,000,000 tons. However, notwithstanding the steady decrease, tabulations of operations for the coal year to the end of the week of March 26, show quite a large increase over 1920, the total being 517,-701,000 tons, as compared with 479,542,000.

Conditions are the same with anthracite. During the week of March 26 the production totaled 1,564,000 tons; the week of March 19 showed an output of 1,687,000 tons; for the week of March 12, 1,926,000 tons, and for March 5, 1,922,000 tons.

Carloads shipped from the mines show corresponding weekly decreases. Bituminous shipments totaled 118,880 carloads during the last week of March, or 1,200 less than the previous week, 7,500 less than the week of March 12 and 14,000 carloads less than the first week of last month. Anthracite shipments totaled 29,902 carloads, or 7,000 less than the record for the first week of March.

COON-DEVISSER MOVES

The Coon-DeVisser Company, Detroit, has moved into its new headquarters at 1772 West Lafayette boulevard. As during the last eleven years, the company will continue to handle a complete line of mechanical equipment, including Taylor stokers, Ball engines, Ashton valves, Buffalo fans and pumps, Carrier air washers, cooling towers, Hoppes heaters and meters, Illinois vacuum systems and steam specialties, Kewanee heating boilers, Copes regulators, Patterson-Kelley closed heaters, Richardson-Phenix fitters, lubricators and Mc Kut valves, Tycos recording thermometers, Uehling recorders, Vulcan soot cleaners, Ellison draft gauges and General Electric flow meters. In addition, the company maintains a supply department which carries in stock a large supply of standard goods.

A Taylor stoker service station, which will supply parts for Michigan has been organized. The officers of the company are: Thurlow E. Coon, president; J. H. DeVisser, vice-president, and treasurer; H. P. Wilder, vice-president and manager of engine, pump and heater department; H. H. Hughson, vice-president and manager of heating and ventilating department; A. W. Conklin, vice-president and manager of fuel saving apparatus department; F. H. Field, secretary and assistant treasurer and manager of supply department. The company now has twenty persons in its organization.

DETROIT LIFE INSURANCE SHOWING

The record of the Detroit Life Insurance Company apparently indicates no diminution in the demand of the people of Michigan for life insurance. This company wrote $7,053,000 of paid-for business last year. The record of written business for the first quarter of the present year is $2,457,470. Compared with the first quarter of 1920, this shows an increase of $230,000. Net paid-for business in the first quarter of the present year was $1,-480,139; for the March month, $742,133.

The record for the month of March was $1,-025,000. The company, while it is operating exclusively in Michigan, is producing such remarkable results in new business as to attract interest and attention in international life insurance circles. Total business in force April 1 was $22,741,303.

MONROE MERGER MAY 5

The plans of consolidation of the Boehme & Rauch Company and the Monroe Binder Board Company, both of Monroe, have been approved by the stockholders of these concerns, and the actual transfer of stock to the new corporation will effected May 5, at which time directors and officers will be elected. The consolidated interests will represent about 500 tons of paper board production daily all of which will be manufactured into folding paper boxes, fibre and corrugated shipping containers and other specialities; the new company being the largest of its kind in the United States.

Bill to Fix Interurban Rates Passed By Legislature

A bill giving the Michigan Public Utilities Commission power to fix rates on interurban lines, these rates to be based upon the valuation of the property and lines, where no franchises take precedence, has been passed by the House. It was introduced by Representative Andrew Glaspie, and the vote was 79 to 11. Until there has been an appraisal and audit of the property and books of companies affected, the bill allows the commission to fix temporary rates based upon earnings per mile.

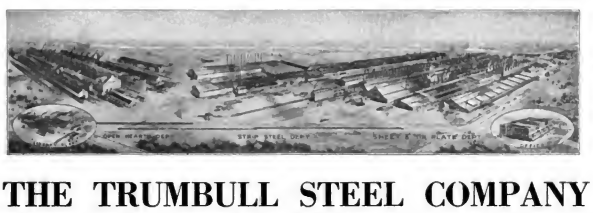
The main purpose of the bill was to rewrite the Smith law passed in 1919, which permitted interurban lines to charge rates as prescribed by the law regardless of existing franchises. The State Supreme Court upheld the law and the Detroit United Railway was permitted to fix its rates notwithstanding the terms of certain franchises. The hill provided for single track as the basis for rates. Representative John Stevens, Detroit, offered an amendment to incinde double track, bnt it was lost. Representative William Hnan, Grand Rapids, attempted to kill the bill on the grounds that the people in his section were more interested in adequate service than lower fares.

The rates of fare to be in force until the valuations have been decided follow:

A flat rate of one cent for all distances of five miles or less, and for all distances in excess of five miles, the following, based on gross passenger and freight earnings of the lines in 1920: lines earning $16,000 a mile or more, one and one-half cent per mile, lines earnings $12,-000, two cents per mile, those making $8,000, two and one-half cents per mile, and all under $8,000, three cents per mile.

ENGINEERS CHOOSING DELEGATES

Seven delegates representing the Michigan Engineering Society will be appointed at a meeting in Lansing today to attend the American Association of Engineers' annual convention at Buffalo, May 10-12. The meeting will be held at the office of the Lansing city engineer, Otto C. Eckert, at 1:30 p. m. Those from Detroit who will attend are Patrick W. Keating, consulting engineer; Everitt M. Bangham, divisional engineer for the Pere Marquette Railway, and Clarence W. Hubbel, Detroit city engineer. The state chapter has several thousand members.



1903-4 MAJESTIC BLDG. DETROIT, MICH.

PACKARD BORROWS $10,000,000

The Packard Motor Car Company, Detroit, has sold an issue of $10,000,000 of 8 per cent 10-year debentures to a New York banking syndicate consisting of the Guaranty Company, National City Company and Montgomery & Company.

CREDIT MEN'S CONVENTION

The twenty-sixth annual convention of the National Association of Credit Men will be held in San Francisco, June 14 to 17, under the auspices of the credit men of northern California, who are organized with about 1,000 members. Attendance will be between 1,500 and 2,000, according to advance hotel reservations, according to F. S. Jeffries, secretary-manager of the San Francisco association. Among requests received are 150 from New York, forty from Chicago, fifty from Cleveland, twenty each from Detroit and Pittsburgh, and twenty from New Orleans. Entertainment plans include a trip on San Francisco bay and an ascent of Mt. Tamalpais.

SENATOR TOWNSEND'S BILL

Senator Townsend, Michigan, sponsoring a bill designed to keep the market price of Liberty bonds at par by providing an automatic increased or lowered interest rate every six months.

PENINSULAR CASTINGS BANKRUPTCY

The bankruptcy case of the Peninsular Steel Castings Company, pending since November, 1914, will be closed at a meeting of the creditors with the Security Trust Company, trustee, April 18. Estimates are that 50 cents on the dollar will be paid on claims.

Changing Over to Electricity

(*Continued from Page 9*)

inated. The furnaces are self-pouring, which removes another labor item. The company uses revolving mold tables on which the bar or billet molds are set, and into these the metal can be poured with no labor except that which controls the operations of the furnace and the turning of the mold tables.

The company is satisfied that the furnace will produce a higher grade of metal than has been possible with the crucible process. The tight sealing of the furnace and its rocking motion, which constantly mixes the metal and washes the furnace lining, reduces oxidization to a minimum, through which arises the claim of less than 1 per cent metal loss. The elimination of smoke and fumes is a factor not to be overlooked.

The construction of this new mill permits of progressive operations, producing greater efficiency. Bars and billets leaving the casting shop move into the first bay of the manufacturing building, where every operation is electrically controlled. In the three bays of this building are three of the five-ton Shaw electric cranes, one to each bay, which do the handling rapidly and easily. Bar stock coming into the first bay is trimmed at the chopper and cleaned at the slitter. Both of these machines are driven by small motors. Subsequent operations are a succession of rollings and straightening processes with electrically-driven machinery.

The motors used in this building range from 700 horsepower down to 150 horsepower and less. Four of the rolling units in the center bay have two rolls to a unit. Two of these units are driven by 20 horsepower motors, one by a 250-horsepower and another by a 300-horsepower motor. The 22-30 breakdown roller, the first operation through which the bars pass after leaving the chopper and slitter, is driven by a 700-horsepower motor, and breaks the bars down from 1¼ inches to 5-16 of an inch. Other roller units in this building have 400 and 500-horsepower motors. Metal bars passed progressively through these rollers can be rolled down to .001 inch. In this building also are four double oil-burning annealing furnaces. The central power plant is rated at 5,000 kilowatt hours.

Bars and billets from the casting ship pass through the outside bay, return back through the middle bay and continue through the outer bay, at the end of which the completed product is packed and carted away from the loading docks, either by motor truck or train. The construction of this rolling mill required also the construction of a concrete dock, 250 feet long and 50 feet wide, considered by the company as the best dock in Detroit. It may have some utility value in the future, but its construction was necessary mainly because the new mill is built upon piling.

Reducing the Working Force

In the brass sheet and strip mill alone the working force necessary under former conditions has been reduced 25 per cent. At normal production the number of men necessary in this mill will not exceed 300. The increased power and speed of the machines will permit of a greater production with correspondingly lower loss in material.

Prior to the construction of the brass sheet and strip mill the tube mill was the newest of the buildings. In this mill are located the various machines that convert solid brass billets into tubing of various lengths and diameters in one operation. Motors of varying horsepower have been applied to all the machines from the piercers to the scalpers and straightenners. The piercer is driven by a 150-horsepower motor. A three-ton electric crane does the most of the handling.

There remains but the rod and copper mills to be electrified. Installations are in progress now, and when completed the entire plant of the Detroit Copper & Brass Rolling Mills will be on a par with any similar production unit in the country so far as modern facilities are concerned. Although present business conditions might not justify any such expenditure of money, that the company is spending thousands of dollars at this time is evidence of its confidence in the future industrial welfare of the country and its realization that success in the field will depend largely upon strict economy accomplished by the use of the most modern machinery and power facilities.

MERCIER SUES DETROIT ON CONTRACT

John A. Mercier, who had the contract to make excavations for the Charlevoix and Buchanan lines of the municipal railway in Detroit, has sued the city for breach of contract, claiming heavy losses when the city took the contract away from him in order to save $200,000 by doing the work itself. Mr. Mercier's injunction to prevent the city from doing the work was denied in Circuit Court.

RAIL BROTHERHOOD GETS ARBITRATOR

Judge Patrick J. O'Brien, Houghton, sitting in Wayne County Circuit Court, Detroit, has been appointed arbitrator in the fight between the officials of the United Brotherhood of Maintenance of Way Employes and Railway Shop Laborers and two ousted directors, Alex under M. Everett, Sebastopol, Cal. and John Hull, Rock Island, Ill. They were turned out on charges of misconduct. Judge O'Brien will act as arbitrator until the annual meeting of the grand lodge in October, 1922.

New Rauch & Lang Plant Unit Is In Production

The first unit of the new plant of Rauch & Lang, Inc., Chicopee Falls, Mass., makers of the Raulang electric passenger cars, has been completed. Production is being increased steadily and the concern expects to make and sell 400 vehicles during the remainder of this year and is preparing already for doubling the output in 1922.

Plant unit No. 1 is a one-story brick, sawtooth type structure, 300 by 320 feet in dimensions, and with nearly 100,000 square feet of floor space. The plant equipment is like the factory itself—of the most modern type.

Although the present company was incorporated only a little more than a year ago—in January, 1920, with a capital stock of $5,000,000—the business is more than three-quarters of a century old, being the outgrowth of or the successor to the Rauch & Lang Carriage Company's business. It was more than 20 years ago that Mr. Lang began making electrics.

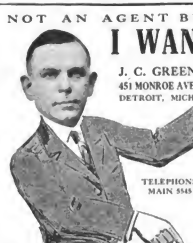
The officials of the firm are: Paul A. Frank, president; Harry H. Doering, vice-president in charge of sales and advertising; Nathaniel Platt, vice-president in charge of exports and of the New York branch; N. W. Stanley, general manager; E. I. Ruskchief, engineer; P. D. Le Veness, director of purchases and service. Mr. Frank was successively with C. P. Kimball Company and the Woods Motor Vehicle Company, Chicago; Anderson Electric Car Company, Detroit, and the Magnetic Motors Corporation, Chicago. Mr. Doering has been with the Gramm-Bernstein Motor Truck Company and Ohio Electric Car Company. Mr. Platt has been connected with the selling of electric vehicles for the last 15 years, mostly in New York. Mr. Stanley has been identified with the Owen Magnetic Motor Car Company, Biddle Motor Car Company, General Electric Company and other well known firms. Mr. Rusk was formerly chief engineer with the Flat Motor Car Company, American Locomotive Company and Owen Magnetic Motor Car Company.

RALSTON-NOLAN BILL FIGHT

With the opening of Washington headquarters the Committee of Manufacturers and Merchants on Taxation will begin its campaign for the Ralston-Nolan land tax bill, which would put a tax of 1 per cent on all land valued at more than $10,000. It is claimed this measure will relieve 25 per cent of the taxation on business enterprises and raise a billion dollars in revenue.

DETROIT ENGINEERS GET AWARD

L. P. and J. A. Smith, Detroit contractors, have been awarded $119,000 for extra work in dredging the Detroit River by the United States Supreme Court, affirming the decision of the United States Court of Claims.



FLOORING MILLS FOR U. P.

Through the purchase of 172,000 acres of timber land in the Upper Peninsula by Godfrey Von Platon, Von Platon Fox Lumber Company, flooring mills will eventually be established at Iron Mountain and contiguous points for the manufacture of lumber products. Cut-over lands will be sold for agricultural purposes at moderate prices, the company announces.

INJUSTICE TO NEWTON TOOL WORKS

The Newton Machine Tool Works, Inc., Philadelphia, advises this publication that its name should have been included on the list of slotter manufacturers, published in the issue of April 2, inconjunction with the article headed: "Planers, Shapers and Slotters." The eastern concern also make crank planing machines.

LONG
COOLING SYSTEMS

The Recognized Standard for Tractors, Trucks and Motor Cars

Submit Your Radiation Problems to Us

Every Long Cooling System is scientifically adapted to the engine which it serves, thereby assuring maximum Cooling efficiency. Illustration is a design recently created for the Brockway Motor Truck Company, Cortland, New York.

WHETHER used on Motor Cars, Trucks or Tractors, Long Cooling Systems assure continuous service uninterrupted by any radiation trouble.

19 Years Experience

devoted to the engineering, manufacturing and perfecting of the most efficient Cooling System of automotive radiation has developed an organization and facilities that permit the highest quality of work, immense quantity production, and results to meet the requirements of the largest and most exacting manufacturers.

The success of the Long Cooling Systems is attested by their widespread adoption in the automotive industry.

Rail Rates and Commodity Prices

Some Figures Showing Relationship Between the Two; Views Expressed by Chairman E. E. Clark, of the I. C. C.

By JULIUS PARMELEE
Director, Bureau of Railway Economics, New York

HAS the cost of transportation to the users of the railways increased in greater ratio than other production costs, has it remained stationary, or relatively has it declined?

The inquiry is pertinent at any time, and especially so when, as at present, the whole fabric of railway expenses and charges is being closely scrutinized; the question of wage levels is now before the Railroad Labor Board, and analysis of the effect of increased railway rates is constantly carried on by the Interstate Commerce Commission.

The reasons why there is so much interest in railway rates at present, and in their effect on and relation to production costs and general prices, are two:

First, economic conditions are in process of post-war liquidation, and the effect of every factor on all other factors becomes of relatively greater importance than usual.

Secondly, the increased rates instituted by the Interstate Commerce Commission in August, 1920, became effective almost the same time that prices commenced to decline, a decline that has been maintained virtually without interruption to the present moment.

Prices were at their peak in the months of May and June, 1920, and the present decline started in July.

What Determines Rates?

Before taking up the question of the relative position of railway rates, it may be noted in passing that what determines the level of freight and passenger rates is not primarily their relation to other economic factors (although the relation cannot wholly be ignored) but the financial needs of the railways.

Of necessity, if the United States is to have an adequate and efficient transportation system, the public must pay for their transportation service such rates as will meet the cost of the service plus a reasonable return on the investment. Only so can the service be continued efficiently and satisfactorily. If under these conditions transportation rates should at any time become relatively a greater proportion of the cost of production, then the economic structure must be adjusted to such greater proportion, for without adequate rates the transportation system would break down, and with its break-down all economic processes would go to ruin.

As a matter of fact, transportation rates did not assume a relatively greater weight among the cost factors in production until recently. Till November, 1920, rates occupied a relatively lower position than before the war, and for the greater part of the time a very much lower position.

In showing the facts underlying this statement, the calendar year 1916 will be taken as the base year, and later data will be related to the averages for that year. The year 1919 is selected as the base year because that was the last complete year prior to the entry of the United States into the war.

The average receipts per ton mile in 1916 were the lowest ever recorded. This being so, the increase in any subsequent year will be greater than if the comparison was made against any other year; that is, selection of 1916 weights the scale against the railway rates, and makes it by so much the harder to prove either that rates have gone up at a relatively lower rate than prices, or that they have increased at a greater rate, but only slightly greater.

The lower the points from which a given increase is measured the greater the increase will be, and the higher the percentage of the increase, because computed on a lower base as divisor.

Comparison is here made of the increase in freight rates (stated in terms of average receipts, or prices, per ton mile) from 1916 to the latest data for which statistics are available, and the increase in the average wholesale price (indicating the values of freight cargoes) of 327 commodities, as determined by the Bureau of Labor Statistics of the United States Department of Labor. These are official statistics, the large number of commodities included makes it sure that the basis of measurement is broad and representative, and the several commodities are averaged together in proportion to their relative importance.

Beginning with the year 1916, the changes in average receipts per ton mile and in the index number (or relative average price) of all commodities have been as follows:

Year or month	Average receipts per ton mile—cents	Index number of wholesale prices
1916	.707	124
1917	.715	176
1918	.849	196
1919	.972	232
1920	1.052	243
September, 1920	1.151	242
October, 1920	1.226	225
November, 1920	1.263	207
December, 1920	1.209	189
January, 1921	1.192	177

Reducing this table to a relative basis by taking the respective averages for 1916 as 100 and computing the other figures as percentages of the 1916 base, the results are as follows:

Year or month	Average receipts per ton-mile—relative	Index number of wholesale prices—relative
1916	100	100
1917	101	142
1918	120	158
1919	138	171
1920	149	196
September, 1920	163	195
October, 1920	173	181
November, 1920	179	167
December, 1920	171	152
January, 1921	169	143

From this table it appears that between 1916 and 1920 wholesale prices increased from 100 to 196, or 96 per cent, whereas freight rates increased from 100 to 149, or 49 per cent.

Inasmuch as the latter half of the year 1920 was a period of increased rates and declining prices, the table includes a comparison of the monthly results from September (the first complete month under the increased rates) to January, 1921 (the latest month for which returns are available). In September the index number of prices was 195 and of rates 163. In October the two relatives were 181 and 173, respectively. Prices (for freight cargo values) were still relatively higher than rates.

The situation changed with the sharp decline in prices in November and December, whereas railway rates remained fairly stationary. In November the relatives were 167 for prices and 179 for rates, in December they were 152 and 171, and in January 143 and 169.

Back of 1916

To present a fairer comparison of the trend in rates and prices, one should go back of the year 1916, which was a year of rising prices. In fact, the index number of prices rose from 101 in 1915 to 124 in 1916, whereas rates actually declined from 100 in 1915 to 99 in 1916. That is, the railways in 1916 had already experienced a heavy rise in operating costs, with no increase in their rates.

Putting the comparisons on to this more

Darling in the Chicago Evening Post.
What D'You Say, Let's Go Over in the Old Pasture and Shoot Blackbirds?

Digitized by Google

extensive base involves going back to 1913, the base year utilized by the Bureau of Labor Statistics for its price data. The results are as follows, the year 1913 being taken as the base throughout:

Year or month	Average receipts per ton mile. Actual cts.	Relative	Index number of wholesale prices
1913	.719	100	100
1914	.722	100	100
1915	.722	100	101
1916	.707	99	124
1917	.715	100	176
1918	.849	118	196
1919	.973	135	212
1920	1.052	146	243
September, 1920	1.151	160	242
October, 1920	1.224	171	225
November, 1920	1.263	177	207
December, 1920	1.269	164	189
January, 1921	1.193	166	177

This comparison shows that as late as January, 1921, prices even after the considerable decline since the summer of 1920 were 11 points higher than rates, the index numbers being 177 and 166, respectively.

It should also be observed that up to the close of 1920 rates lagged far behind prices.

In 1916 rates were at 99 and prices at 124; in 1917 the spread was between 100 and 176, prices being up three-quarters, with no change in rates; in 1918 the spread was 118 and 196; in 1919, 135 and 212, and in 1920, 146 and 243. In 1920, therefore, prices had outrun rates by almost 100 points; that is, by 100 per cent of the 1913 base prices.

The turn came in September, 1920, when rates started up to 160, then to 171, then to 177, and finally remained around 168, whereas prices declined from 242 in September to 225 in October, then to 207, 189 and 177.

It must be recalled in this connection, however, that railway rates in the years 1913 to 1917 were the lowest on record, and that the railways were even then feeling the pinch of inadequate revenue to meet their expenses and fixed charges.

One point in this connection deserves comment, and that is the effect of increased rates on prices and on business. It was freely predicted in August, 1920, that increased freight rates would still further increase prices and would shut off traffic. Both predictions proved incorrect. As already pointed out, prices have been declining ever since the increased rates went into effect, so that the effect of the higher rates has not been in the direction of boosting prices. Respecting the effect on traffic, the months of September and October, following the rate increase, showed no ill effects from the increased rates. On the contrary, September traffic was good, while October traffic was with one exception the greatest ever handled by the railways in a single month.

Since then traffic has declined heavily, but the underlying reason has been not the increased rates but the general business depression.

Prices Due to Economic Conditions, Clark Asserts

In a recent address before the Railway Business Association, Chairman Edgar E. Clark, of the Interstate Commission, said:

"The difficulties which, as an effect of the war, have been encountered here with regard to operating expenses and necessarily large increases in rates and fares have similarly been experienced in other countries.

"Information, so far as it is obtainable, indicates that the increases have not been greater here than elsewhere, and that our railroads emerged from the war period in better physical condition than those of most other countries. The difficulties are not peculiar to our land and are not the result of local conditions or of details of management or operation. They result from the operation of world-wide economic forces which can not, under the conditions that have obtained, be controlled.

"The relief must come gradually as a result of readjustment of those economic forces. It will be accelerated or retarded accordingly as we all meet or shirk our duty to lend a willing helping hand.

"When we consider the circumstances out of which present conditions grew is it not sensible and reasonable to recognize the necessity for gradual readjustment of the economic forces and affairs of the world as the foundation for gradual improvement in the situation we are discussing? Some rates are too high to permit the free movement of traffic. Some rates are unreasonably low. Careful study of such situations has been and is going on, and readjustments have been and are being made accordingly.

"Doubtless there have grown up operating expenses, the aggregate of which is substantial, which can not reasonably be defended. They should be eliminated. Every effort must be made to insure all possible, attainable, reasonable economies. The owners of the properties may be obliged for a time to accept less return upon their investment than would otherwise be expected.

"If reason can prevail and a united, genuine effort can be put forth and maintained, it is morally certain that the situation will improve and that we will progress toward that condition of affairs which the Congress had in view, which the law contemplates and which we all hope to see. Slightly paraphrasing an expression I read recently—'It is doubly encumbent upon us in the stand which we take to avoid the appearance of selfish shirking.'

"We all know how large a part popular impressions have in forming public opinion and how long it takes for the slowly developing proof of facts to rectify such impressions when once they have taken hold. We must build upon the foundation of experience and sound business judgment that is free from 'selfish shirking,' and not upon the unstable ground of theories and opinions that in large part ignore the true facts.

"Some critics assert that the law makes of the railroad business a preferred business and confers upon the owners special favors. Others assert that it recognizes a preferred class of labor.

(*Continued on Page 38*)

It Is Reported W. E. Flanders Will Join Durant

W. C. DURANT is picking an "all-star cast" for Durant Motors, Inc. At the time his resignation as president of the General Motors Corporation was announced, some time ago, it also was announced that three or four of the higher executives of that organization were casting their lot with him in his new enterprise. Last week came announcement of the fact that Richard H. Collins, president and general manager of the Cadillac Motor Car Company, would join Mr. Durant in an executive capacity of great responsibility.

Now comes a report from a source that cannot be ignored that Walter E. Flanders, one of the foremost figures in the automotive industry for several years, will associate himself with Mr. Durant in Durant Motors. The report has not been verified either by the Durant interests or by Mr. Flanders. The latter, who has been wintering in Florida, was due in Detroit the first of this week, but up to Tuesday had not reached the city. Consequently no opportunity to ask his comment on the report was afforded. However, as was said above, the story that he is about to join Durant Motors comes from quarters considered most reliable.

Mr. Flanders retired early in 1919 as chairman of the board and general manager of the Maxwell Motor Company, Inc., in the upbuilding of which he had been the chief factor. At that time it was said he probably would locate permanently in Chicago, where he had interests. He has maintained an office in the Book building, Detroit, as head of the Flanders Realty Company. He also is understood to have offices in Chicago.

Although he has been connected with several other automobile companies, it is what Flanders did at the Maxwell which will go down in automotive history as his big work so far. For it is conceded by those who know that it was principally due to Mr. Flanders' genius that the Maxwell Motor Company became one of the five or six largest automobile producers in the country.

The present Maxwell company, or the company in existence up to the recent reorganization, was the outcome of the amalgamation of the Metzger Motor Car Company and the United States Motor Company, which had been itself a combination of the old Columbia, Stoddard-Dayton, Brush, Alden-Sampson and Maxwell-Briscoe companies. It was in 1913 that the new Maxwell Motor Company was organized and Walter Flanders was asked to become president, which position he retained until the fall of 1917, when he was elected chairman of the board of directors and general manager. W. Ledyard Mitchell, of Cincinnati, was chosen president. During his presidency Mr. Flanders changed the policy of the company to that of building only a single model instead of a large variety, as had been the custom of so many other concerns, and which custom was the cause of so many concerns' failing. Thus only one model of Maxwell was made, but with several styles of body. The new idea made a decided hit, so much so that the production of Maxwell cars increased from year to year and the company joined the ranks of those which were making more than 50,000 vehicles annually.

Prior to joining the Maxwell organization Mr. Flanders was with the Ford Motor Company as production manager for about two

Yankee Business in Wooden Shoes

Trade Possibilities in Holland and Her Colonies; Significance of the Enlarged Fairs at Utrecht

ONE REASON why foreign countries, particularly Germany, will give the United States a run for its money in world trade is the exacting attention given to every minute detail of commerce in every country, civilized or otherwise, on earth. It is not always the business opportunities of the moment that command attention, but the character of developments or changes of custom which indicate future demand for goods that are important. For instance, when the cannibals poll a majority vote against cooking and eating missionaries and their enemies, if they have not done so yet, the cannibal maidens will no longer do up their hair with human bones; consequently the hairpin industry should be interested.

Marked changes in customs and the development of new occupations are going on constantly in many countries where the United States will sell goods in the years to come. One cannot visualize Holland without her windmills; yet these wind-driven, whirligig affairs are out of style, if not entirely out of use. No more are being built. They never were efficient, but until Germany produced a motor sufficiently powerful to do the work at less initial cost and maintenance charge, Holland held fast to her windmills. Manufacturers in the United States endeavored to sell windmills out of business by designing a wind motor, but the terrific gales in the Netherlands blew the wind motors to kingdom come, and thus Germany seized an opportunity. The type of Dutch windmill so often seen as a background for little Hans Brinkers in wooden shoes cost about $10,000, and developed only 11 1-5 horsepower. One mill can drain 1,335 acres when the lift is four feet and two inches. However, old Boreas hangs around the Dutch Venice only about 1,440 hours, thus rendering it difficult to hold the desired water level. Inasmuch as the Dutch were most directly interested in keeping dry it would seem that they should have been able to develop their own motors, but apparently not, for Germany built the Hercules motors and the Netherlands have been using lots of them. Centrifugal pumps replaced scoop wheels. Thus Holland's needs became Germany's advantage and a foreign trade relationship was built upon economic and social necessities.

The Fair at Utrecht

Other changes are taking place in Holland which are more important from a foreign trade standpoint than the transition from windmills to motors. One is the proposed draining of the Zuyder Zee with a view to increasing the area of the country, providing more elbow room for the population and more productive power. Dutch engineers are planning to erect a dam across the Zuyder Zee, which will be 18½ statute miles long, cost approximately $10,000,000 and require nine years to build. This dam will reclaim four "polders," or coulées, having an aggregate area of 494,000 acres. The soil thus drained will be fertile, most probably used for agricultural purposes, which indicates a future demand for farm implements.

Another change which will come home directly to American manufacturers and exporters is the development of the Utrecht fair into the International Industries Fair, the most effective way of informing the world that the Netherlands and its colonies are in the market for foreign goods. The Utrecht fair was started in 1917 on two sites and with temporary wooden buildings. It was mainly for Dutch manufacturers, although exhibits were sent from other countries. This event has developed so rapidly and served such a useful purpose that the promoters have decided to lay out eight sites and build permanent stone structures. The first one has been put up. It was financed by Dutch manufacturers who contributed $1,200 per capita, in return for which they received one sample room each. The Dutch government aids in the support of the fair with an annual loan of $400,000.

The Dutch are methodical people. Once they realize their needs, they make constructive efforts to supply them. The country needs foreign goods, American goods, and is prepared to make the necessary arrangements to get them. Following this purpose the exporters and manufacturers of other countries will be given an opportunity to have a part in the development of this fair. Other buildings to be constructed will be for foreign exhibitors, who can have the same privileges as the Dutch manufacturers by contributing toward the expenses of the buildings, and in return have ample rooms reserved for them. The first building has 340 sample rooms and 1,000 square feet of table space. Subsequent buildings will be as large, or larger. The 1921 fair will be held September 6 to 16.

Dutch Trade Possibilities

The Netherlands, unlike so many other European countries, is not poverty-stricken. In fact it is said by some authorities that there is more satisfaction to be gained in the Dutch trade situation than with any other country. Dutch thrift is axiomatic. The battle of the people to keep the sea at a respectful distance has made them a nation thinking in engineering terms, even though limited largely to hydraulics. This fact alone presupposes a market for metals, machinery and tools as well as food products.

Holland has been regarded as the clearing house for northern European commerce because her imports go ont to Belgium, northern France, Germany, Denmark, Austria, Czechoslovakia, Switzerland and Scandinavia. Trade with Holland means not only commerce with these countries but the Dutch East and West Indies. In 1920 one-fifth of Holland's imports were from the United States, amounting in money to $265,000,000. Included were hog products, cotton, grain and breadstuffs, coal, petroleum and its products, and mineral oils, tobacco, copper and metals, milk products, sugar, tires, automobiles, leather and naval stores.

Exports to the United States were valued at $95,000,000. The population of Holland was given as 6,700,000 when the last census was taken. The area is 12,680 square miles. The per capita debt is $159.

Amsterdam and Rotterdam are the principal ports, through which the clearings for 1913 were: Amsterdam, 3,170,936 tons; Rotterdam, 12,785,661 tons. Normally the Dutch guilder is 40 cents, but its value has decreased as has that of currency in other European countries. The rate of exchange as reported from New York recently has followed this range: November 1, 1920, .3037; December 6, 1920, .3045; January 1, 1921, .3125; January 24, .3312; January 31, .34; February 14, .3385; February 14, .3425; February 21, .3405; March 29, .3450.

Latest reports from Holland show no depression or unemployment in the shipbuilding and engine industry, although German competition is being felt in ship repair and iron construction lines. Large government orders have been placed with the Dutch plants, which helps the home industries. German competition in foundry, electro-chemical and engine industrial lines has been so keen that an embargo has been considered, but such a move would be against Holland's free trade policy.

(*Continued on Page 40*)

Signs Away Right To Ply His Trade; Agreement Holds

UNDER the terms of an opinion handed down by Judge M. L. Dunham in superior court at Grand Rapids, a few days ago, Mike Wawryka can't wash windows in Grand Rapids, operating as the Grand Rapids Window Cleaning Company; that is, so long as an injunction signed by the court holds good.

Of course, under the old English common law, Mike couldn't have signed away his right to wash windows in Grand Rapids, but as history progressed and the English courts did things to the common law and later the American courts did a few more things to it, matters reached such a point that a workman could sign away his right to exercise his trade.

In the case at issue, Benjamin M. Friedman, operating as the Grand Rapids Window Cleaning Company, sued Wawryka to enjoin the latter from operating for a certain period of time covered in an agreement by Wawryka, at the time he sold his window cleaning business to a second party, Friedman having purchased the business from the second party. There was a contention as to whether such agreement could be transferred by the second party.

In his opinion, Judge Dunham goes back to the English common law which provided that an agreement which placed any restrictions upon a man's right to exercise his trade was void, as against public policy, and traced the changes in this attitude through later rulings of the English courts, then through rulings of the American courts to date.

As a result he issued the injunction which holds until the final hearing in the case or until the further order of the court.

What Michigan Manufactures In the Way of Electrical Equipment

Something About the State's Standing in This Industry With a Glimpse Into Some of the Important Plants

By F. W. HERSEY

WHEN Ben Franklin tapped the electrical energy of the atmosphere more than 150 years ago and told men that therein lay a great force for the use of futnre generations, he not only revealed a new power which at the time caused more fright than rejoicing, but he paved the way for an industry the possibilities of which seem limitless today. Since Franklin's day, the key and kite, which constituted his principal laboratory equipment, have become transformed into hundreds of thousands of miles of wire, tons of machinery and thousands of devices, all having but two major purposes—the production and application of electrical energy for commerce, industry, transportation, art and science.

So greatly, and yet so gradually, has electrical energy crept into the lives of men that the individual mind fails in any attempt to visualize its many services and ramifications; nor can it through the keenest of imaginative power conceive the world without electricity. In the United States alone, since Franklin's time, sufficient motors to produce 19,760,000 horsepower have been installed, which power, uncontrolled, could create such destruction as to cripple the world. The application of electrical power to industry by classes is recorded for 1920 by the Electrical World as follows:

Iron and steel, 5,920,000 horsepower; textile mills, 2,230,000; miscellaneous industries, 1,-$40,000; stone, clay and glass, 1,500,000; paper, 1,500,000; food, 1,440,000; chemical industries, 1,320,000; lumber, 1,010,000; railroad repair shops, 837,000; vehicle plants, 740,000; mines, 712,000, beverages, 356,000; leather, 336,000.

The first application of electrical energy in the crudest form called for apparatus, and the constantly increasing methods of application and uses are requiring new developments in great variety of equipment. Around this power great corporations have been created and massive plants built. The peculiar needs the power has called for one class of industrial product; the application of the power requires another. Men have delved deeper into the mines and cut more coal because of the demands of electricity, while in the delving and the cutting, electrical power is rapidly replacing hand labor and steam. The United States, the youngest of the great nations, has achieved its leadership of the world largely because of electricity. It has accomplished more in a few hundred years than other nations have in thousands of years.

Michigan Ranks Sixth

In the application of electricity to industry Michigan ranks sixth among the states, the relative positions being as follows: Pennsylvania, California, New York, Illinois, Massachusetts and Michigan. And Michigan has just started when compared with California and Pennsylvania. In California the per capita value of electrical equipment is $30; east of the Rocky Mountains it is only $7.70, which shows the electrical development to come.

It is estimated that there are 63,600 electric motors used in Michigan and the connected load horsepower is 647,000. Some idea of the advance the state is making is indicated by the increase in motor equipment and horsepower load since 1915, which these figures explain:

Number of motors in 1915, 26,400; 1916, 33,800; 1917, 43,300; 1918, 50,300; 1919, 53,300; 1920, 63,600.

Connected horsepower load: in 1915, 288,000; 1916, 331,000; 1917, 422,500; 1918, 502,500; 1919, 562,000; 1920, 647,000.

The increasing use of electrical power means that the development of uses and devices for its application has been steady, and the necessity of organizing corporations and building plants in which to manufacture these devices and essential equipment has been and will continue to be great.

Michigan cannot claim leadership in the electrical industry as it can in automotive, pharmaceutical and other manufacturing lines, but the state has at least 50 plants in nineteen cities, the investment in this industry is roughly estimated at $10,000,000, and the value of the annual product at from $25,000,000 to $30,000,000. The product includes motors, wire, furnaces, safety switches, switchboards, transformers, tools, batteries, starting devices for automobiles, lamps, washing machines, flat irons, household utensils, lighting and power equipment and accessories. The list would cover a great many typed pages. It must be remembered that whatever the electrical industry is in Michigan, it is entitled to credit in view of the existence of such huge organizations as the Westinghouse, General Electric and other corporations.

Many of the companies manufacturing electrical goods owe their existence to the possession of certain patents, the character of which places these companies in a class by themselves, and through them a product is offered the public, which must come from Michigan. There are, for instance, the Howell Electric Motors Company, Howell, which builds a polyphase alternating current motor with an adjustable bearing; the Detroit Electric Furnace Company, Detroit, manufacturing a peculiar and exclusive type of rocking furnace for brass, copper and iron melting; the Square D Company, Detroit, making a certain type of safety switch box; the American Electrical Heater Company, Detroit, said to be the oldest concern in the country, if not in the world, making electrical devices to take the drudgery out of housework, and so on.

One of the great advantages of electrical power is the ease of its transmission over great distances. Applied to industry, the "juice" leaves the central station, travels almost with the speed of light to the transformer, and thence to the motors within the plant. Therefore its application in the industrial plant begins at the motor or motors used in driving the various machines. The best inventive brains and millions of dollars have been spent in perfecting various types of direct and alternating current electric motors.

The "Red Band" Motor

One type of motor, which is a Michigan product marketed in many foreign countries as well as in the United States, is the Howell "Red Band" polyphase alternating current motor manufactured in Howell by the Howell Electric Motors Company, organized in 1915 by H. N. Spencer, president; C. F. Norton, vice-president, and W. M. Spencer, secretary and treasurer. This business was built upon a patented adjustable bearing. The company, capitalized at $30,000, occupied a small building, 40 by 100 feet, and in 1915, the first year of production, did a business of $13,238.28. In 1920 the company occupied a plant consisting of three buildings with an aggregate floor space of 50,000 square feet, manufactured and sold 6,300 motors, the business totaling in money, $956,735.43, of which $170,000 was the revenue from export business. Twenty per cent of the product was sold in Michigan.

To manufacture these motors the company had to buy materials such as sheet steel, copper wire, malleable and gray iron castings, zinc, tin, insulating materials, steel shafting, pulleys, brass, lathes, drill presses, shapers, millers, punch presses and a multitude of other equipment and materials, the cost of which ran to half a million dollars. Most of this material was purchased in Michigan. This is the only company manufacturing a motor with an adjustable bearing, the main purpose of which is to protect a plant against curtailed production or shutdowns due to the motor breakdowns resulting from worn bearings.

When a motor is stopped because the one-piece bearing is worn down sufficiently to remove all clearance, it is necessary to keep the motor out of commission until an electrician can replace the worn bearing. The re-

placement may require only a few hours; then again it may take days. In the interim the motor is useless, and, unless the machinery it moved can be hooked up to another motor, it is out of use also. The Howell motor with the two-piece bearing eliminates this trouble. When one-half the bearing is worn down it is necessary only for the repairman to open a slot in the side of the motor frame, insert a screw driver and turn the movable bearing 180 degrees, which gives a new bearing surface and restores the clearance. Such an operation requires but a few moments and production is not interferred with until such a time as operations are stopped for some other reason, at which time a new bearing can be set.

The operations necessary in the manufacture of this motor show the advancement made in mechanics through modern machinery. From sheet steel the rotor and stator discs are stamped out in one operation on a machine which also cuts the key slots and punches the rivet holes. Another machine stamps out the rotor slots. These rotor and stator laminations are then run through rubber rollers which apply insulating varnish to both surfaces. Rotor and stator, from this point, take different routes. The stators are stacked on drums between end frames and set in a hydraulic press under 100 tons pressure, after which they are riveted.

In the meantime the end frames, which are castings, have had locating shoulders turned on them for the bearing housings and then put into expanding arbors to get true centers for the bearings. Holes have been drilled in the frames and the frame feet milled for adjustment to the motor bases. This prepares the stators for winding.

Conserving Time

Shafting stock comes in long, cold-rolled steel rods, which are cut to the proper length by a power saw and machined in a low swing lathe with multiple cutting tools, after which the shafts are finish-ground on a grinding machine. Key-ways are cut on another machine.

The end bells are castings which are machined first. Then a shoulder corresponding to the shoulder on the stator frames is cut; the bearing ends are bored out and holes drilled in the frames. Stators and shafts are ready then for the assembly room. This manufacturing process so far has brought them to a side door which opens into the assembly room, eliminating loss of time in moving them from one department to another.

The rotor laminations are stacked on dummy shafts and set under pressure. Copper bars which fit into the rotor slots are cut and shaped in a stamping press. One end is slotted and the other end is pointed. Rotor laminations and copper bars are sent to the brass foundry, where the bars are set in the slots with the pointed ends protruding to facilitate casting brass rings on each end. After this operation the rotors are machined. The dummy shafts are removed and the regular shafts pressed into place under power. End bells and rotors are then moved to the assembly room.

It is necessary to insulate the stators, which is accomplished by setting in the slots oiled muslin strips fitted into strips of press board, which prevents the wires from short-circuiting on the steel frames and stator laminations. In the assembly room the wiring is wound from spools into coils on a special machine and pressed into the proper shape for the stator slots on another machine. This wire is first insulated by a double winding of cotton thread, each strand being wound from a different direction so that the wire is completely covered and the chance of parting the threads and baring the wire is reduced to a minimum. As the wiring is fitted to the stator slots, it is again wound with oiled muslin and linen tape. After the wire ends have been picked up and connected the completed stators are dipped in insulating enamel and baked in an oven twelve hours at 450 degrees Fahrenheit.

When the rotors and stators have been assembled the end bells are fastened on, the red hand is painted and the motors boxed or crated for shipment. These motors are manufactured in sizes from one to 100 horsepower. They have been shipped to such places as Borneo, Philippine Islands, India, South America and to many European countries.

During the war the Howell plant was on a 100 per cent war production basis. Since the war, in common with other plants in every line of industry, the company's business has decreased. However, the increasing use of motors for agricultural purposes has kept the plant in operation all winter with about 50 per cent of the normal force. Orders have increased within the last two months and C. F. Norton, sales manager, believes business is coming back strong. The present capitalization is $500,000. H. N. Spencer is now president of the company; R. B. McPherson is vice-president; W. M. Spencer, secretary-treasurer; Prof. B. F. Bailey, University of Michigan, chief engineer, and Mr. Norton, who left the company for a time, is sales manager.

Square D Products

Unless properly safeguarded, electricity is dangerous, especially in industrial plants where a great many persons are employed and the character of their work requires that they turn the power on or off frequently during working hours. This danger has encouraged the invention and manufacture of many safeguards from which has grown up a specialized business. One concern engaged in this line of activity is the Square D Company, Detroit, which makes a safety switch box as near fool-proof as any electrical device so far invented.

This company was organized in 1903 as the Detroit Fuse & Manufacturing Company. When the business was sold to the Chicago Fuse Company in 1916 the Square D Company was organized and capitalized at $80,000. It is estimated that this concern does an annual business of $1,250,000, and it manufactures and sells only safety switch boxes.

Another concern specializing in one branch of the electrical industry is the Mutual Electric & Machine Company, Detroit, manufacturing switch boards and control sets. This company was organized three years ago and capitalized at $100,000. Its annual production is valued at $300,000. Much of its product is sold in Michigan, but it has a large business outside the state. This is only one of numerous concerns manufacturing equipment of this character, although the Mutual company has a somewhat exclusive field in Michigan in the marketing of certain types of control systems.

In the manufacture of household appliances, such as toasters, percolators, irons, laboratory equipment and some small industrial articles, the American Electrical Heater Company, Detroit, turns out annually about $3,500,000 worth of product. This company was organized about twenty years ago and is capitalized at $100,000. It has modern manufacturing facilities where between 80 and 90 different electrical units are made. When this company was organized the introduction of electrical power into the home was nowhere nearly as general as at present. It has taken a great amount of money and development work to popularize the great variety of labor-saving devices for the home.

This naturally calls attention to the growing importance of vacuum cleaners, washing machines, mangles, dish washers, stoves and other household equipment, some of which is manufactured in this state. The Eureka Vacuum Cleaner Company is a Detroit concern. Washing machines are made by the Crystal Washing Machine Company, also a Detroit company.

Industrial Equipment

In the field of industrial equipment the Detroit Electric Furnace Company has an important place. This concern has perfected and is manufacturing electric furnaces for melting iron, copper and brass, and its product has contributed to the revolutionizing of metal melting and casting methods, which since ancient times, have been confined to the crucible

When the old-fashioned method of starting an automobile engine by brute strength and a crank became burdensome, it was electricity that solved the problem and made the motor car more of a pleasure and less of a course in physical culture. The Liberty Starter Company, Detroit, found an eager public ready to buy its product, and has prospered.

The Marble-Card Electric Company, Gladstone, manufactures direct connected motors, also generators and farm lighting systems. Wire for electrical purposes is manufactured by the Detroit Copper & Brass Rolling Mills, Detroit, and the American Enameled Magnet Wire Company, Muskegon. Among the battery manufacturers are the Atlas Storage Battery

Digitized by Google

Company, Greenville; Schug Electric Manufacturing Company, Detroit; Detroit Battery Company, Detroit; Ramsey Electric Company, Detroit; Sprague, Waldo Manufacturing Company, Detroit. The Litcher & Lite Corporation, Grand Rapids, makes glass and rubber jars for batteries.

In the ignition field there are such concerns as the Champion Ignition Company, Flint; Michigan Wheel Company, Grand Rapids, and the National Coil Company, Lansing. In the electric vehicle list are the Anderson Electric Car Company, Detroit; the Fuller Company, Detroit; Couple Gear Freight Wheel Company, Grand Rapids; Grinnell Electric Car Company, Detroit.

Other manufacturers of electrical supplies, appliances or equipment are: Champion Brass Works, Coldwater, electrical combination fixtures; Seidler-Miner Company, Detroit, water tight electric fixtures; Hanlon Manufacturing Company, Ludington, generators and appliances; Enbergs Electrical & Mechanical Works, St. Joseph, direct connected motors and equipment; A. B. C. Starter Company, Decan Blower Company, Detroit, electric blowers; Company, Menominee, telephone bells, Amerityoit, starters; Roeding Signal Light Company, Detroit, lamps; Tideman Electric Company, Menominee, electro-medical supplies; Schwarze Electric Company, Adrian, telephone and electric bells; Menominee Electric Manufacturing Ciarage Fan Company, Kalamazoo, electric fans and blowers; Renulife Electric Company, Detroit, high frequency voilet ray generators; Dake Engine Company, Grand Haven; Advance Electric Company, Flint; Lansing Electrical Engineering Company, Lansing.

Stoddard Telephone Construction Company, Monroe, telephone supplies; Ajax Electric Tool Company, Ludington, tools and appliances; Covel Manufacturing Company, Benton Harbor, electric specialties; Detroit Coil Company, electric coils; Moore Telephone Manufacturing Company, Cars, telephone specialties; Jarvis Engine & Machine Works, Lansing, electric equipment; Hastings Manufacturing Company, Hastings, electrical equipment; Kuhlman Electric Company, Bay City, electric appliances; Miller Light & Fixture Company, Detroit, fixtures; Hoskins Manufacturing Company, Detroit, prometers and electric equipment; Pelton & Crane Company, Detroit, electric furnaces; Michigan Brass & Electric Company, Lansing, electrical supplies; M. & S. Electric Company, Flint, supplies; Stoecker Motor and Armature Company, Detroit.

Michigan Rail-Utility Assessments $291,551,150

The total tentative assessed valuation of railroad, telephone and telegraph companies in Michigan for 1920 is reported by the state tax commission to be $291,551,150, as against $284,433,700 in 1919. The tax on this property, except the sleeping car companies, is used for the primary school fund, and the assessed may be heard on the assessments until May 10. The rate of taxation this year will be $26.40, while it was $24.60 in 1919. About 60 tank oil lines were brought into the state during the year, making one of the principal increases, while there was a decrease in refrigerator property.

The total assessments for the five different classes of property follow:

Railroad companies, $246,445,000 for 1919, and $250,215,000 for 1920.

Sleeping car companies, $700,000 for each of the two years.

Express companies, $1,415,000 for 1919, and $1,900,000 for 1920.

Car loaning companies, $2,649,000 for 1919, and $3,483,000 for 1920.

Telephone and telegraph companies, $33,224,650 for 1919, and $35,253,450 for 1920.

The Grand Trunk Railway Company gets the biggest individual boost, being increased from $32,015,000 to $35,515,000. All of the remaining railroad companies in the state remain at practically the same figure as for 1919. There is just the one express company, the American, noted in the totals above.

The Michigan State Telephone Company is increased from $21,500,000 to $23,000,000, and the American Telephone & Telegraph Company from $1,050,000 to $1,200,000. The Citizens Telephone Company, Grand Rapids, is increased from $2,750,000 to $2,900,000.

RUGGLES FETED AT ALMA

To F. W. Ruggles, the man who did much to make Alma the important industrial center it is today, honor was paid a few days ago when he was the guest of more than 100 business men at a banquet tendered him at the Wright House. A silver loving cup was presented to him. Mr. Ruggles was the founder of the Republic Motor Truck Company. He is now head of his own motor truck manufacturing concern, the Ruggles Motor Truck Company, Ltd., of London, Ont. It is reported that he will locate a plant at Saginaw.

CONSTRUCTION CO. WINS SUIT

A jury in Judge F. W. Brennan's division of the Genesee circuit court, at Flint, has awarded the Industrial Construction Company damages of $14,751 against the Champion Ignition Company. The action was brought to recover what the services of the construction company actually worth regardless of the original contract made between the parties for the construction of new buildings, and the repairs of other buildings. The construction company claimed the Champion Ignition Company put them off the job without cause after they had worked thirteen weeks.

RECORD GERMAN COPPER ORDER

The Lake Lind. n Copper Times says that the Michigan Smelting Company has received an order for export of 800 tons of Copper Range copper, to be shipped in two lots of 500 and 300 tons respectively, the whole requiring from sixteen to twenty cars. It is thought the bulk of the metal is going to Germany. This is the largest single copper order for export received at Lake Linden since before the war and is equal to about a month's production by Copper Range mines at present basis of output. Early in February, 280 tons of copper went forward to Germany, and more recently 175 tons were shipped.

BENTON HARBOR NOMINATIONS

The nominating committee of the Benton Harbor Chamber of Commerce has chosen the following members from whom a president and directors are to be elected: For president: W. F. Dowland, E. C. Flintrup and W. H. Hearn; directors, Dean Peters, P. J. Maner, J. N. Klock, Wilbur Cunningham, H. U. Rapp, F. S. Hopkins, W. O. Pratt, Clinton Closson, Will Godfrey, Tom Green, A. B. Higman, S. R. Banyon, William Witherall and Mervin Strouck.

Land Titles and Title Insurance

By JOHN N. STALKER
Vice-President, Union Trust Company, Detroit

THE BASIS of our national wealth and the most direct and tangible embodiment of our national effort is the land and the improvements on it—together referred to as real estate. Almost every good citizen owns or aspires to own a piece of real estate—perhaps for a home; perhaps for a farm, which is both a home and a source of livelihood; less often for other purposes. Such real estate may represent the savings of a lifetime, perhaps of several. It is almost always the reward of many years of effort, patience and self denial; it constitutes the physical embodiment and setting of the most vital of our institutions, the home. It behooves a nation, accordingly, with particular care and jealousy to safeguard real estate titles, or the ownership of land. This is the paramount purpose of our real estate law, and this purpose it has attained. Personal property is easy to protect, simple to transfer and its loss is seldom the overwhelming calamity that is apt to be the case with real estate. Modern business demands for such transfers the utmost speed and facility. As to real estate transfers, however, it has for centuries been considered, and rightly, that the controlling consideration must be safety. This is the consideration which should never, under any circumstances, be sacrificed. The individual is to be protected by the precautions which have been devised for his protection; he is less so as he understands them better.

Obviously the ownership of real estate can not be determined by occupancy; neither can the land itself be labeled. Transfers are made by formal papers called deeds, signed with some formality by the old owner and delivered to the new. Mortgages and other liens on, and interests in, land are similarly evidenced. Now, to use the simplest illustration, a man might conceivably deed the same piece of land to each of a dozen purchasers simultaneously and collect from each, or might place thereon a number of alleged first mortgages. The statutes provide, accordingly, for public registry offices where instruments affecting land may be recorded; and provide further that the public record of such instruments may be relied upon to show the state of the title. Hence a warranty deed from a man shown by the record to be the owner of a piece of land is a good deed, notwithstanding that he may have previously given another deed which is not recorded. The public records affecting titles also include the tax records, frequently the death records, the orders of courts in such matters as the descent of property to heirs, mortgage foreclosures and other cases in litigation.

Real estate titles being as they are, however—the processes sound and seasoned but necessarily intricate because the relationships of human life are intricate—the tracing of a title and the determination of its validity are not matters for the layman. The old expedient and one that for many years served well, was that of retaining an attorney to examine the public records and give an opinion on the title. In the years have passed, however, the difficulty of making such an examination, of a thorough and adequate character, has enormously increased and there has grown up a class of men who give their entire time to this work and are called abstracters. The abstracter, individual or corporate as the case may be, "abstracts" from the records and submits in summarized form the essential provisions of all instruments, court orders, tax information and the like appearing to him to affect a given

The U. S. Army and Good Roads

Why Improved Highways Are of Prime Importance To Our Military Forces; How the Latter Are Helping

By MASON M. PATRICK
Colonel, Corps of Engineers, War Department

IN the first place, the roads over which an army must be supplied have been aptly likened to the arteries of the human system. Should the enemy succeed in cutting one or more of these arteries, the same result follows as when a man is thus injured; and to the army may likewise come death of defeat. In fact it may be safely said that the number, the character and the direction of the roads in any theater where an army is operating have more influence than other factors in determining its plan of campaign.

Napoleon's axiom that an army travels on its belly is still true, and the soldier cannot fight long upon an empty stomach. He must be fed and his rations must be transported to him wherever he may be. In any active campaign there is a point somewhere behind the lines beyond which it is utterly impossible to transport material by rail. From these railroads all of the many different kinds of material which the army must use can be taken to their destinations in no other way than in wheel vehicles over such roads as there may be in existence. Take for example our army in France, where we found that it required an average of about fifty pounds, made up of many items, per man per day to keep this force going. For the army of 2,000,000 men we had in France when the war ended this meant transporting daily for longer or shorter distances something like 100,000,000 pounds, or 50,000 tons—no small task as may be readily understood.

Again, the army is interested not alone in the number and in the character of the roads, but likewise in the directions given them when they are located. In France, for example, the highway system radiated from Paris like the spokes of a wheel. To movements in certain directions this system lent itself admirably, but where it was necessary to transport material somewhat at right angles to the main line of travel, we met with difficulties. Similarly, in this country, along our strategic frontiers, we must give thought to the directions in which the road systems are laid out. To speak plainly, if we should ever be embroiled with our neighbors on the north—although this is a contingency which we trust will never occur, but to which we must give thought, as more improbable things have happened—it is to our vital interest that the road systems in the border states should lend themselves to the movement and to the supply of troops. Similarly, along our southern border, where we face a more turbulent neighbor, it is of prime import that the road systems should enable us to move r.adily and rapidly, whether for the purpose of crossing the border or repelling a hostile effort originating in the land south of it.

The army is also interested in the matter of motor transport. As i have said before, there is always a point beyond which we must abandon carriage by rail and resort to other methods. It is not too much to say that more than any other one thing the motor vehicles made possible the waging of war on the gigantic scale which we witnessed during the titanic struggle between Germany and the forces opposed to her effort at world dominion. Practically all of the many things needed during such a war, including the men themselves and their weapons, had to be transported in motor cars. The total number of motor trucks with the American Army in France when the war ended was 32,987, and we could have used many more. If all the motor vehicles with the army had been placed end to end, as closely as possible, they would have stretched over a road space of a little more than 290 miles. It was not at all an uncommon sight to see divisions of 25,000 men moving along the roads in such trucks, and not infrequently the odd combination of French trucks driven by Chinamen loaded with American soldiers, as they were carried toward the front to take their places in line or were withdrawn after grueling days in order that they might obtain a little rest in some more quiet sector.

While the roads in this theater of war had most of them been in existence for many years, they were practically all waterbound macadam, with here and there some asphaltic surfacing, and they had been kept in repair during the lighter traffic of peace time only by the exercise of eternal vigilance and the prompt restoration of any spot which had been injured. Over these roads the heavier army traffic had to go, and it was imperative that near the front they should be kept in perfect order so that high speed might be maintained. Just as an illustration of the need for roads, when the Germans made their attack upon Verdun the only avenues of supply for the sector were one wagon road and one narrow gauge railway. This road was of the greatest use; in fact, the ability of the French to hold Verdun against the German attacks depended upon their ability to transport men, ammunition, provisions and the like over this road, and there were carried over it daily thousands of tons of ammunition, supplies and many men; in fact, so constant was this traffic that trucks going and coming passed a point on the road every twenty-five seconds.

It was necessary to keep this road in thorough order, and the French had about one man per yard working every hour of the day in order to maintain it in proper condition, and so important was it to their plans for the defense of this place that today the French call it "La Voie Sacre," or "the sacred road."

One thing particularly the main French roads was the thickness of the road metal. This had been developed from year to year and in places was two to nearly four feet thick. It gave an excellent foundation upon which to place the road surface, but when the surface was worn away, it left an exceedingly rough road which, having itself been torn to pieces by the passing trucks, then proceeded to revenge itself by shaking the trucks to pieces. It was borne in upon us then that there must be some co-operation between the builders of motor vehicles and the builders of highways, in order that each might be properly proportioned to the other. At first we were strongly inclined to the more noticeable about the

Factory School for Draughtsmen an Innovation

Despite the fact that draughting is one of the most vital parts in automobile body manufactura, there are scarcely any schools of body draughting in the United States. The need for men trained in this work has resulted recently in the establishment of a class at the C. R. Wilson Body Company's plant, Detroit. It is being taught by Walter H. Jones, experimental and research engineer, who stands facing the class in the picture.

Students are recruited from all parts and departments of the plant and offices, and the response from the innovation has resulted in a demand for a second class.

This is not the only educational feature of the Wilson company's work. Lectures are delivered on Wednesday afternoons on various subjects identified with the company's operations and methods. There have been talks on efficiency, taxation, production of steel sheets, grading, sealing and other operations on lumber, use of forms, tool room practice and many more topics. They are stimulating wids interest throughout the organization.

Digitized by Google

powerful, heavy trucks, each of which would carry a heavier load, and there is no doubt that if the roads are suited to such vehicles, they are much the more economical; but this condition was not fulfilled in France, and when we found how rapidly they tore the roads to pieces we were forced to turn toward lighter vehicles carrying lesser loads. But this, of course, means more of them, more men to drive them and more road space required. This is a matter which must be studied with care, and it is hoped that we shall be able to cooperate with highway and automotive engineers in such a manner that their efforts will result in the production of highways and vehicles, both of which will be adapted to the Army's needs.

If cost is not a governing factor, we may say that it would be possible to build a road strong enough to carry any traffic which might be taken over it. Likewise, if cost is disregarded, it would probably be possible to build motor vehicles heavy enough to destroy any road which might be constructed; but the cost of roads and vehicles is a most important factor, and somewhere between these two extremes there is a proper mean which we must find. It is a question whether roads should be built now strong enough to withstand the maximum traffic expected over them in the future or whether they should be so built that they may be strengthened economically as the density of traffic increases. The motor truck has come to take a place in our economic life. When we remember that a truck may easily cover a hundred miles in daylight hours, while the average twenty-four travel of freight cars is only twenty-six miles, it is evident that there is a field which motor transportation can occupy and one which it is important for us to develop. To much money has already been wasted in attempts to build roads for horses, which are now known to be incorrect, and the time has certainly come when this problem must be studied and when we must find a proper solution.

The immense quantity of supplies which had to be transported for our army has already been mentioned and we were, of course, concerned with the amount which could be moved by motor transport. It was figured that with each truck occupying a space of fifty yards, each loaded with two net tons, and the truck train traveling at the rate of twelve and one-half miles an hour, about 900 tons of freight would pass a given point in one hour. Making some allowances for accidents, it is estimated that on a good three-track, two-way road, operated all day and all night, about 10,000 tons of motor transport may be taken as a maximum capacity.

There is another matter which we deem of importance, and that is a thorough knowledge on the part of all of our own personnel of the rules of the road and their strict enforcement. When one has seen traffic obstructed, literally miles of trucks and other vehicles held up, due to some minor accident which might have been voided, and when one realizes the truth of the saying that a world has been won or lost in five minutes, that the fate of an army or of a battle may depend upon the promptness with which its supplies arrive, the need for such strict enforcement of traffic rules is borne in upon you in a way and to a degree which will never be forgotten. For example, prior to the attack on the Marne battlefield, we had had little practice in formulating and in insisting upon the proper observance of the rules of the road. The roads over which we had to advance had been battered by shell fire and it was necessary to put them in condition for use. While such work was in progress strict traffic regulations should have been established, but this was not the case, and at one point where work was in progress, "a three-ton truck followed by a string of ambulances dashed, full speed into the place of unfinished work and stuck. Traffic was blocked. Everything else—wagons, carts, kitchens, trucks, tanks, a one-horse sulky and one man with a baby buggy—poured into the road, filled it solidly from ditch to ditch, and the block was complete." It took many hours of valuable time for motor trucks to remove this mass from the road, to continue work upon it and to put it in condition for further use.

If, then, the men who come to us in the Army have had thorough training in such rules of the road, if in this broad land of ours it is possible for a measure of uniformity of such rules to be brought about—and this is certainly desirable—our subsequent training of these men will be made easier and the interruptions to traffic in time of emergency which might otherwise disorganize an entire plan of campaign may possibly be obviated.

It is for these reasons that the War Department does think a keen interest in the development and has appointed a representative in the Federal Highway Conference in order that that the Army may co-operate and may receive a large measure of co-operation in its efforts to fit itself for whatever be the task the coming years may hold.

Now just a word concerning what the Army itself is doing to further this movement. You have no doubt heard of the opportunities which are being given to men to learn while they are soldiers to train themselves in order that they may be better citizens when they return to civil life after their brief service with the colors, and it is in just such schools that we are trying to fit them for real, useful work in connection with the enormous problem of road building, of traffic control and of motor transportation. There are open to all these men numerous courses, for any of which they are encouraged to volunteer, and there have been engaged men as teachers who really know their jobs. It will be understood that we are taking a large number of young men who would never have any college or university training and many of whom lack even the advantages of high school training. While we have no ambition, desire or intention of turning them out as college graduates, we do believe that in their three years' term of service we can make them better men, better able to earn their living, and with a sense of respect for law and order, which is a wondrous asset when possessed by the citizens of any country, and the lack of which may prove a country's undoing.

In these army schools there are now enrolled 40,000 men, and they are taking courses according to their own likings, carefully guided of course, but still leaving to them a large

Farm Equipment Manufacture in Michigan

THREE INDUSTRIES occupy a prominent place in the pioneer history of the older states of the Union. One is rum distilling, another is milling and the third is agricultural implement manufacture. This last may or may not have reached further than the simple workmanship of a village blacksmith, but if the latter gave any amount of time to the fashioning of plowshares, rakes, hoes, hand or horse and hand-power tools for the soil, he was listed as a maker of agricultural implements.

Undoubtedly the blacksmith shop was the birthplace of farm implements, and as the first collection of buildings large enough to be called a settlement always included at least one blacksmith shop, the manufacture of farm implements cannot honestly be said to be peculiar to any one state. Michigan, for years a leading agricultural commonwealth, had its host of blacksmith shops and its annual production of farm tools in common with the other pioneer states.

$6,000,000 *Invested*

To speak of the manufacture of agricultural implements today is to consider machinery in its most advanced form—gang-plows, tractors, harvesters, threshers, planters, shellers, ensilage cutters, binders and many other inventions, which have made it possible for this nation to feed itself and a large part of the world as well. Millions of dollars are invested in the manufacture of these machines and in the great quantity and variety of hand tools, and the annual production runs into more millions.

In Michigan, which is not reckoned as an agricultural implement manufacturing state in the sense that it is an automobile state, there is invested approximately $6,000,000 in that industry, distributed among twenty-nine listed manufacturers, and while this number is considerably larger than sixteen years ago, the cause lies not in the decline of the industry, but its concentration in fewer, but larger and more productive units. Unfortunately it is one of the industries for which no official record is kept, so that detailed information is difficult to obtain.

In 1900 there were listed by the Michigan Department of Labor fifty-nine manufacturers of farm implements. The investment was given as $8,832,344 and the value of production as $6,839,508 annually. Five years later the number of manufacturers had dropped to forty-two, but the investment had increased to $14,342,106 and the production to $8,719,719. Competition by the large companies created the necessity of many small concerns to meet effectively this competition caused the decrease in individual manufacturers or plants.

The product at this time consisted of threshers, plows, land rollers, cultivators, harrows, potato planters, corn planters, horse rakes, hay tedders, hay pressers, feed cutters, feed cookers, root cutters, bean seeders, bean harvesters, bean sorters, fertilizer spreaders, grain drills, post hole diggers, sprayers, corn shellers and other implements, in fact the state was in a fair way to provide itself with all the machinery and tools necessary to its particular kind of crop production. The plants were located in 33 cities.

To manufacture this product the companies or individuals purchased annually materials to the value of more than $3,500,000. The scale on which they manufactured is shown by a few figures in these lines. Cultivators, 25,683; harrows, 26,291; plows, 25,058; drills and planters, 106,173; threshers, 2,150; horse rakes, 378; harvesters, seeders and binders, 302.

As in every other industry, the big year for implement manufacturers brought many new concerns into being, some to exploit new inventions or improvements on old ones, and others to manufacture only parts or special equipment for machines and tools already existent. In the lean years many of these concerns fell by the wayside.

Some Michigan Concerns

The year 1920 is not a good one by which to judge the potentialities of any industry, nor it's standing in the general class of industries. But a few instances of manufacturing growth in this line will suffice to show that the manufacture of farm implements is a flourishing industry in this state despite the competitive and productive powers of several corporations operating upon a scale comparatively as great

Detroit and Flint Lead U. S. in Re-Employment

In the March report of the United States Employment Service section of the Department of Labor, made public a few days ago, two Michigan cities, Flint and Detroit, top the list as to re-employment. All told, 65 cities throughout the country made reports, twenty-one showing an increase in number of employed, while forty-four showed a decrease. The cities which reported gains, with the percentage in each case, are the following: Detroit, 32.4; Flint, 12.2; Memphis, 10.5; San Francisco, 9.2; Toledo, 7.9; Paterson, N. J., 6.8; Portland, Ore., 6.8; New Bedford, Mass., 5.6; Atlanta, 5.3; Manchester, N. H., 5.2; Minneapolis, 4.8; Syracuse, N. Y., 4.6; Yonkers, N. Y., 3.7; Seattle, 2.9; Los Angeles, 2.5; Johnstown, Pa., 2.2; Kansas City, Mo., 1.1; Trenton, N. J., .8; Youngstown, Ohio, .6; St. Louis, .3; Lawrence, Mass., .1. Among the cities which showed a decrease are Denver, Colo.; Columbus, Ohio; Milwaukee; Buffalo; Chicago; Omaha; Cincinnati; New York; Louisville; New Orleans; Pittsburgh; Newark, N. J.; Worcester, Mass.; Baltimore and St. Paul.

The reports concerned 1,421 firms employing 501 men or more, and which on February 28 employed 1,612,611 persons. At the end of March 1,587,786 were on the payrolls. The decrease since January in employment at these plants were 40,384 men, or 2.5 per cent.

It was in the automotive industry that progress was most marked in March, the official report says, for in these industries the percentage of gains over February was 28.1 per cent. In the tobacco industry the gain was 8.5 per cent; leather and its finished products, 1.7 per cent; liquor and beverages, .4 per cent; lumber and its manufacture, .3 per cent.

Further falling-off were reported in these industries: Iron, steel and other products, 6.5 per cent; metals and metal products, 4.5 per cent; paper and printing, 2.8 per cent; food and kindred products, 2.7 per cent; stone, clay and glass products, 2.7 per cent; chemicals and allied products, 1.8 per cent; textiles, 1.7 per cent, and railroad repair shops, 1.7 per cent.

SAGINAW BOARD ELECTION

The annual meeting of the Board of Commerce of Saginaw resulted in the election of the following officers: George H. Hannam, president; Wallis Craig Smith, first vice-president; John Jeffers, second vice-president; directors, Harry P. Baker, John A. Cimmerer, Edwin C. Forrest, Guy S. Garber, Max P. Heavenrich, Julius W. Ippel, Charles T. Kerry, Harry E. Oppenheimer, John Popp and Edward Schust.

U. S. FOREIGN TRADE OFF

America's foreign trade in March was nearly three-quarters of a billion dollars less than in the same month last year, figures made public this week by the Department of Commerce show. Exports for the month were $384,000,000, compared with $820,000,000 in March, 1920, while imports were only $252,000,000, as compared with $524,000,000. This left a trade balance for the month of $132,000,000 as against $296,000,000 in March, 1920.

A RECORD CUSTOMS PAYMENT

Ernest Rose, United States deputy collector of customs at Grand Rapids, was paid $35,316 last week by the Consolidated Cigar Company, which withdrew all the tobacco which was held in its warehouse. It is stated that this was the largest single collection ever made in the city and the amount was equal to total average collections for a month.

STRAIGHT LINE METHODS

Balanced Business

No sales department, however well organized, can operate successfully with indifferent buying and producing facilities. Production on the other hand, however efficient, becomes overproduction, if not balanced by capable selling. Balance between departments must back-up co-operation if waste, unnecessary overhead, shut-downs, are to be avoided.

Balanced Business, which means Better Business, is almost wholly dependent on sound Accounting Methods. Timely and dependable Facts and Figures from every department are the balance wheels — the executive's surest guides. All intelligent progress, broader missions, co-ordinated strength, larger profits — depend upon them.

And that Facts and Figures may more quickly and clearly tell the executive their vital story—Graphic Charts, the moving pictures of your business.

New Steel Wheel for Automobiles

Jefferson Forge Products Company, Detroit, Brings Out Innovation as Light as Wood

WHEELED transportation is no better than its wheels, and practically all land transportation moves on wheels. Because no satisfactory substitute has been discovered for wheels, the efforts of engineers for the last 200 years or more have been directed toward the improvement of wheels with a view to making them lighter, stronger, more resilient and as simple in construction as possible. They have been made in the form of wooden, steel, iron, bronze, copper and even gold discs. They have been made with wooden, iron, steel and wire spokes; with solid tires, pneumatic tires and metal tires. Coil and flat springs have been used in lieu of spokes to obtain resiliency.

Man's first attempt to make what we know now as a vehicle in a general sense resulted only in a sledge. The next development was

the log roller, then the wooden disc, and finally a wheel with crude spokes and twisted leather for tires. Then there was a period of 2,000 years during which little or no improvement was made in wheels. Fulton's steam train had wooden wheels. Only dreamers believed that transportation speed would so increase that wooden wheels could not be used.

The advent of the automobile brought sharply to the minds of engineers that wheels would have to be improved, and the experiments that have been carried on and the many designs of wheels tried ont testify to the importance of this subject. Steel wheels for railroad trains are common, but for motor vehicles they are uncommon. Steel wheels have been made for heavy duty motor trucks, but steel applied to wheels for passenger vehicles traveling on rubber tires of the pneumatic type has been much out of the ordinary.

The Jefferson Forge Products Company, Detroit, has just perfected a drop forged, one-piece steel wheel for passenger automobiles, which is claimed to be as light as an ordinary wooden wheel, while embodying all the advantages of steel toughness and resiliency. It is a ten-spoke wheel, conventional in design and attractive in appearance, and can be made for any type of passenger automobile. The wheel is of unit construction, combining hub, spokes, brake drum and felloe in one piece of forged steel. Thus all bolts, nnts and other loose parts are eliminated. The spokes are concaved with the hollow side facing inside, so that the wheel as it is fitted to the car has the appearance of the ordinary spoked wheel as we are accustomed to see it.

Both wire and wood have been considered the best wheel types from the standpoint of weight. The efforts of the designers of the Jefferson drop-forged steel wheel have been directed toward gaining the lightness of either wood or wire, with the qualities of forged steel, and the design, which, while being individual, would not depart too radically from what the public has come to accept as the conventional automobile wheel.

The designers claim they have produced a wheel which comes as near being indestructible as it is possible to make. Repeated tests have been made with various weights and types of cars to prove the lateral strength of these wheels in curb collisions and to ascertain if it is possible for a wheel of this character to get out of alignment through rough usage. The fact that a single forging is used of course eliminates the possibility of losing alignment under ordinary conditions. There being nothing to loosen, the natnral assumption would be that loss of alignment would be largely obviated under any condition, which is what the designers contend has been amply proved in this case. In case of severe strain affecting the alignment temporarily, the elasticity of the steel will restore it, it is asserted. The metal takes a high enamel finish so that the appearance of the wheels can hê made to conform to the body finish of the car.

The Jefferson Forge Products Company has been in business in Detroit fifteen years, manufacturing drop forgings such as crankshafts, transmission gears, axles and other automotive parts, and has all the facilities necessary for quantity production. The company officers are: Russell A. Alger, president; Frederick M. Alger, vice-president; Charles E. Wade, vice-president and general manager, and F. Archer Hinchman, secretary and treasurer.

"We have faith in the prosperity of Detroit," said Mr. Davis, "and we are here to stay. The gradual improvement in conditions is far more healthy than any "boom" could be. There is business to be had but it won't pick itself up; it must be picked up. This in my opinion is the best time for far-seeing organizations to attain or maintain leadership. Sound advertising is going to help."

Action of the Week in Michigan Legislature

By H. BOND BLISS

[Staff Correspondent, Michigan Manufacturer and Financial Record]

LANSING, April 18.—Matters which vitally concern the industrial corporations and public utilities of Michigan held the center of attention in the Legislature during the last week. The corporation tax bill finally passed the House, and with the Governor's signature, it provides the state with a new source of revenue amounting to at least $6,000,000 annually, and which is expected to meet the deficit this year. The bill was passed as originally introduced by Sen. Vandenboom, Marquette, and approved by the Senate, no amendments being accepted. It was given immediate effect.

The bill levies an annual tax or license on all corporations doing business in the state, both domestic and foreign, for the privilege of exercising the corporate powers granted by the state. This tax is three and a half mills on all paid-in capital and surplus, with a minimum tax of $50 by any corporation and a maximum of $10,000. The latter limit is fixed in order to keep within the constitutional decisions of the courts, which hold that when a license fee reaches too high a figure it becomes a tax and with the other property tax would make double taxation and therefore be unconstitutional. The minimum was fixed so as to raise the amount desired.

The vote on the bill was 82 to 12. Rep. Ramsey, Lansing, one of the twelve, explained that 63 per cent of the corporations of the state were forced to borrow money to pay their taxes, and a further burden not only endangered the industries but also the thousands of workmen. Rep. DeWitt, Ioseo, said it was a method of dodging the income tax, while Rep. Moore, St. Clair, who voted for it, admitted that the measure was "the most unfair and unjust thing ever proposed in the three sessions" of his legislative experience, but the state needed the money.

The Glasple interurban rate bill was passed by the House and sent to the Senate for action. The bill would place all power for fixing rates in the hands of the Michigan Public Utilities Commission, and during such time as they are not fixed, provides a regular schedule of rates, classified on a basis of the gross passenger and freight earnings of the companies. These rates range from one and a half to three cents a mile. The measure is not to interfere with existing or future franchises, with half fares for children between five and twelve years of age.

The Atwood bill to place a tax of one cent a gallon on all gasoline, distillate, benzine and other volatile and inflammable liquids used in automobiles, was reported out by the committee on roads and bridges of the House, with a recommendation that it pass. Under an amendment, one-half of the money would go to the state highway department and the other half to the general funds. The tax would be paid on the fifteenth of each month by importers, manufacturers and producers in this state.

Senator John W. Smith's bill to empower counties to own and maintain an office for the issuance of abstracts of title on lands was given final passage, with an amendment requiring a majority of 75 per cent in a referendum on the installing of such a system.

Another step in the reorganization plan of the state government was taken in the passage by the House of the bill creating the state department of public welfare, supplanting the boards of control of seventeen institutions and the state board of corrections and charities.

Utility bills continue to pour in. One of the latest is that of Rep. David A. Green, Pontiac. This bill provides that contracts betwen utilities and municipalities cannot be broken, and at the expiration of franchises if the two parties can not agree, they may appeal to the utilities commission. The latter would arrange for the appointment of an arbitration committee to investigate, fix the rates and report back to the Commission. If this report was not satisfactory another committee would be named, but in the meanwhile the rates would hold.

Senator B. G. Davis, Lawton, introduced a bill which would place jitney buses under the control of the utilities commission, requiring them to furnish bonds for protection in case of accidents and damages, and would also standardize rates.

The Senate passed Rep. George Lord's corporation codification bill with a few amendments. The Osborn utility bill has been somewhat modified by amendments to meet certain objections relative to franchises, control by the utilities commission, giving utilites the right to appeal to courts if they protest the

RUGGLES FACTORY FOR SAGINAW

Reports from Saginaw are to the effect that the plant of the Saginaw Shipbuilding Company has been sold to Frank W. Ruggles, former head of the Republic Motor Truck Company, Alma, and will be converted into a factory for the manufacture of a motor truck. Associated with Mr. Ruggles will be Julius Kirby, former secretary of the Saginaw Board of Commerce. Announcement will be forthcoming soon as to the name and types of truck to be manufactured. Mr. Ruggles already has organized a Canadian corporation to make commercial vehicles.

The Saginaw Shipbuilding Company was developed during the war by local manufacturers and produced a considerable amount of tonnage. It is entirely modern in layout and considered excellent for large manufacturing.

APEX MOTORS REORGANIZED

The Apex Motor Corporation, of Indianapolis, which makes the Ace passenger cars, has been reorganized. O. W. Heinz has withdrawn as president and general manager and has been succeeded by Harry T. Hanover. At the meeting of the creditors a committee was elected, which, with the representatives of the financial companies interested in the Apex, agreed to give the company a year's extension on its outstanding accounts. This agreement covered 97 per cent of the creditors and the two finance companies. The latter contracted to finance the operations of the Apex for a period of twelve months, beginning March 1.

As a result of these arrangements, the Apex corporation announces that the present model will be continued, and to offset the decrease in the price of materials the company has decided to add various extras to the equipment, including spare wheels, frame tire holders trunk racks, Spanish leather upholstery and burnished radiators. The new Model "G" Ace will have the Gny rotary disc-valve engine. This new model is now rapidly nearing a production basis. A few cars have been shipped to dealers for demonstration and show purposes.

OLD TIMERS HONOR HAYNES

Directors of the Old Timers' Club, at their recent meeting in Flint under the presidency of Albert Champion, ruled that membership in the organization will be apportioned in three classes: the senior, or men of ten or more continuous years of service in the industry; the junior men, who have been with the industry from five to ten years, and the owner associate, this being the owner of a car who owned and drove cars in 1906 or prior to that.

One of the first steps taken by the directors in the way of special recognition of old-timers was to elect Elwood Haynes, president of the Haynes Automobile Company, Kokomo, Ind., as honorary member No. 1.

CLEVELAND TRACTOR SLOWS UP

The Cleveland Tractor Company plant, Cleveland, will be temporarily operated on part time. The company has been in full operation all winter. Officials say business is good and that according to dealers' reports the latter will have liquidated their stocks before the end of April.

GOODRICH SPECIAL MEETING

A special meeting of the stockholders of the B. F. Goodrich Rubber Company was to be held in New York this week. The purpose was to ratify a proposal to retire 11,880 shares of the company's preferred stock, which would reduce the capital from $105,412,000 to $107,224,000 and cut the preferred authorized to $47,224,000, as against $48,412,000, as at present. The number of common shares will not be changed.

FRANKLIN'S PROGRESS

The spirited demand for closed cars is the reason why the Franklin Automobile Company, Syracuse, N. Y., has decided to reopen its Richmond avenue body plant, which had been closed since December. About 100 men will be employed and the production schedule by June 1 will be at the rate of 75 bodies a month.

The Franklin company also announces that during the first quarter of 1921 a total of 2,546 cars was sold and shipped; that the entire April production of 940 cars was sold on April 9, and that there remained 420 car orders for April delivery to be filled.

The company reports that during the first quarter its inventories have been reduced more than $1,250,000. Early last fall the inventories totaled $11,000,000; reductions since then have cut the amount to practically $5,000,000. The company says that current accounts and notes payable have been reduced 40 per cent in the three months ended March 31.

GRANT'S APRIL SCHEDULE

The Grant Motor Car Corporation, Cleveland, is reported to have scheduled a production of 450 cars for April, which, it is said, was the total made and sold in March.

S. A. E. STANDARDS MEETING

Reports of the S. A. E. standards committee divisions covering their work for the first half of 1921 will be sent to the voting members of the society in pamphlet form prior to the standards committee meeting at West Baden Springs, Ind., May 24. Copies of the reports may be obtained free of charge from the Society of Automotive Engineers, 29 West Thirty-ninth street, New York city.

The reports consists of complete but concise statements of the practices and constructions recommended, together with such illustrations as are necessary.

The meeting of the standards committee at the West Baden Springs Hotel will be open to non-members of the society who wish to attend. Those especially qualified and who wish to discuss any of the reports will have opportunity to do so.

F. H. EGAN GOES TO HOUSTON

Announcement is made that Frank H. Egan, for eight years production manager for the Nordyke & Marmon Company, Indianapolis; for two years superintendent of manufacturing with the Pierce-Arrow Motor Car Company, and for two years superintendent for the Hudson Motor Car Company, has become associated with the Southern Motors Manufacturing Association, Ltd., of Houston, Tex., having charge of the manufacturing department. The Southern corporation makes the Ranger passenger cars, trucks and trailers.

CHANDLER'S POSITION

It is estimated that earnings of the Chandler Motor Car Company, Cleveland, for the first half of the year will be in excess of $2,000,000, or more than 70 per cent of the entire year's dividend requirements. The company's production is steadily and rapidly increasing. At present shipments are said to be running at the rate of nearly 1,000 a month, as compared with less than 300 during January.

Digitized by Google

GROWTH OF THE DEMAND

Secretary William R. Town, of the Michigan Mortgage Investment Corporation, Lansing, reports that the demand for automobiles in Michigan is steadily increasing, according to word received from representatives of the company throughout the state and also from dealers. The credit department record of the corporation shows that the business of automobile financing in March increased 50 per cent over the combined business of January and February, and the April business has already nearly reached the volume attained a year ago during this period.

SALISBURY WITH MAXWELL-CHALMERS

H. M. Salisbury, well known in the automotive industry, has been made export manager of Maxwell-Chalmers, Inc., succeeding H. W. J. Russell, who resigned because of ill-health. Mr. Salisbury has been with the General Motors Export Corporation, the F. B. Stearns Company and the John N. Willys Export Corporation at various times.

WILLYS-OVERLAND ADDS MEN

Four thousand men are now working six days a week in the Willys-Overland, Inc., plant, Toledo, according to an official announcement from the factory, and by May 1 the number will be increased to 6,000. The working schedule has been increased from four to six days a week.

WHITE COMPANY'S TRUCK OFFER

The recently organized Southeastern Express Company, which will operate lines from New Orleans to Washington, and from St. Louis and Cincinnati to Jacksonville, has ordered 100 two-ton trucks from the White Motor Company, Cleveland.

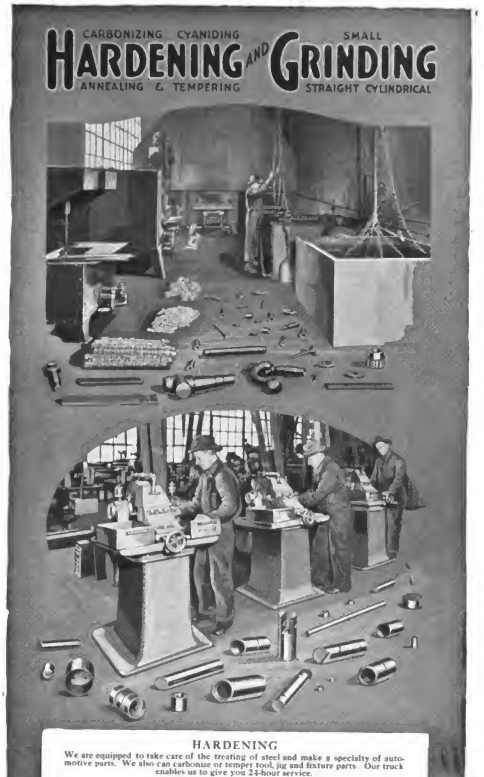
HOLMES-DETROIT ELECTS OFFICERS

The following officers have been elected by the Holmes-Detroit Automobile Company, state distributors of Holmes air-cooled cars: Max Gottesman, president; C. H. Gottesman, vice-president, and A. A. Gottesman, secretary-treasurer.

CUTTER ADDRESSES S. A. E.

John D. Cotter, vice-president and metallurgist of the Climax Molybdenum Company, New York, discussed "Molybdenum Steel" before the Detroit section of the Society of Automotive Engineers, at the Detroit Board of Commerce, Friday evening. This was the Section's last meeting until fall. Dinner preceded it.

WILL MAKE AIRPLANES



The Viking Motor Company has been organized in Detroit to manufacture airplanes driven by a 16-cylinder motor invented by R L. Baily, treasurer of the company. It is announced that a site has been leased at Gratiot avenue and the Ten-mile road, and that thereon, in addition to the factory, hangars will be built to serve an aviation service connecting Detroit with several cities within a radius of 400 miles. John W. Schwartz, formerly of Golden, Belknap & Schwartz, engine manufacturers, Detroit, is president of the company, and Fred W. Aldrich, vice-president and secretary.

COLUMBIA BUSINESS IMPROVING

Several orders for quantities of cars exceeding 100 to an order have been received by the Columbia Motors Company, Detroit.

GOES INTO MANUFACTURING

The Benton Harbor Novelty Manufacturing Company, Benton Harbor, has opened a manufacturing establishment, in addition to its retail shop. The company makes medicine cabinets, mirrors, picture and advertising frames, sewing baskets and mouldings.

HARDENING

We are equipped to take care of the treating of steel and make a specialty of automotive parts. We also can carbonize or temper tool, jig and fixture parts. Our truck enables us to give you 24-hour service.

GRINDING

Special screw machine equipment enables us to specialize in the manufacture of the following parts, all of which can be ground by the centerless method. We can grind to any accuracy required.

Piston Pins — *Valve Rocker Pins* — *Rocker Cluster Pins* — *Dowels Pins (Hardened Straight)* — *Oil Pump Pinion Shafts* — *Roller Bearing Rolls (Straight)* — *Differential Gear Pins* — *Headless Shackle Bolts* — *Universal Joint Pins* — *Small Gear Shafts*

COMMERCIAL HAULING

HOUSE BILL NO. 323 AGAIN

House bill No. 323, providing a tax of five per cent on the gross receipts from motor buses or trucks operated for hire in Michigan and placing the operators under the control of the public utilities commission, is once more among us.

The cartage interests of the state succeeded in having the bill recalled to the House committee on roads and bridges after it had been recommended for passage and placed on general orders. It was reported out by the committee on April 12, with another section added which would compel operators coming under its provisions to be bonded. But this time the committee made no recommendation regarding it and on motion of Rep. John Stevenson, Detroit, the measure was tabled. It is hoped that the session will be concluded without further necessity for opposing the measure.

While the committee made no recommendation as to the passage of the bill, it did recommend adoption of the amendment, which prevailed. The amendment, which goes in as Section 6, provides:

"Section 6. As a prerequisite to engaging in the business specified in section 1 hereof, each person, firm and corporation shall file with the Public Utilities Commission a bond, in such amount as said commission shall require, running to the people of the State of Michigan and conditioned that such person, firm or corporation will well and truly pay and discharge any liability resulting thereto because or on account of its operations as a common carrier on any public highway of this State. Any person who may have cause of action against such carrier arising out of such operations shall be entitled to bring suit on said bond. Each such bond shall be subject to approval by the Public Utilities Commission as to form and surety or sureties. Any person, firm or corporation from whom such bond is required hereby who carries on the business specified in section 1 without filing the same shall be deemed guilty of a violation hereof, and liable to the penalty prescribed in section 6."

GRAND RAPIDS TRUCKMEN BUILDING

L. P. Oltman, Grand Rapids contractor, has been awarded the contract to construct a two-story and basement brick and hollow tile building on Oakes street, near Ellsworth avenue, for the associated truck line operators. The building will have a 76-foot frontage on Oakes street with five large unloading doors to the south and loading doors to the east of the building on the alley side.

It will be so constructed as to utilize basement spaces for garage purposes, entrance being gained through a ramp from the street level. The basement has a clear span of twenty-five feet. The first floor will be used for storage purposes, offices being located on the second floor. The building will be heated by steam; toilet rooms will be located on each floor.

Excavation has been started, the permit issued on plans prepared by H. H. Weemhof, architect.

FINED FOR RECKLESS DRIVING

George Mathews and Leon Inman, owner and driver, respectively, were fined at Charlotte for driving a truck while they were under the influence of liquor. Inman was compelled to pay $60 and spend 20 days in jail. Mathews paid a $10 fine only.

SAGINAW OPERATORS ORGANIZE

Jitney bus operators would be driven off the streets of Saginaw if amendments proposed to an ordinance regulating their operation are put into effect. The amendments would compel the operators to avoid streets on which street cars are operating, except where bridges must be crossed, and would force operators to furnish bonds varying from $5,000 to $10,000.

The jitney men have organized to oppose this legislation and have formed the Saginaw Motor Bus Owners' Association. Officers are: President, Fred Pearson; vice-president, William Block; secretary, J. W. Pirsiel; treasurer, Charles Stoker. The jitney men declare that they organized for service while Saginaw was helpless under a car strike and that they are entitled to some consideration now.

Co-operation of the Saginaw Federation of Labor has been denied the jitney drivers, on the plea that they would be interfering with the street car men's union. The federation, through its president, Edward H. Waterstadt, declared that jitney service was unfair, since it operated for short hauls and could allow no transfer privileges.

HIGHWAY BILLS IN LEGISLATURE

There are twenty-four bills providing for trunk line highways in various parts of Michigan before the House committee on roads and bridges. As a large expenditure would be required if these were reported out, it is possible that none will see the light of day, although many of them are said to be meritorious. Three trunk line highways have been proposed in bills passed by the Senate, but these are also buried in the House committee. The latter believes that in view of the big program of the state highway department this year, these additional roads would only impair the efficiency of the entire plan.

The three bills passed by the Senate are for the Colgrove highway, which provides the building of the road must be started before a period of three years elapses; the Bryant bill, for a road from Monroe to the Ohio boundary, near Toledo, and the Davis bill, for a trunk line in Van Buren county.

DIXIE HIGHWAY RESTRICTION

Due to the condition of the Dixie Highway from Erie, Mich., to the Ohio state line, one course of stone was placed on the road last fall. The original plan to make a macadam road of the seven-mile stretch temporarily is to be followed through and as soon as the quarries are again in operation the placing of the second course of stone will be started. The Detroit Automobile Club has been informed by the officials of Monroe county that the order as to restriction on the weight of motor trucks, which order was issued last November, is again being strictly enforced. The surface of the road is able to bear only light traffic and all commercial vehicles are required to limit their loads on the Highway to one-half the capacity of the truck. The Detroit Automobile Club is now mapping out a detour.

TWO NEW LANSING GARAGES

Two more garage and service stations have been opened in Lansing. The Capital Auto Company, distributor of Dodge Brothers cars and trucks, has opened a larger and better service station in the rear of its sales and stock rooms. This station gives the company 14,000 square feet of space. Frank Graham has opened a garage, salesroom and repair shop at 313½ South Capitol avenue, with space sufficient to accommodate about 75 automobiles. Besides providing garage storage he will do a sales business in used cars and a general repair trade.

INVENTS TRUCK PERISCOPE

The organization of the Truck Periscope Company to manufacture periscopes for motor trucks is contemplated by George H. Penny, Monroe, manager of the Penny Auto Truck Company, operating a fleet of trucks between Detroit, Monroe, Toledo and Akron. The de-

Digitized by Google

vice is the invention of Mr. Penny and through the use of three lenses gives a view of traffic in the rear and on each side of the road.

NATIONAL CONVENTION ON NORONIC

Detroit will entertain the National Team & Motor Truck Owners' Association at the next annual convention, June 13-15. The meeting will be held on the steamer "Noronic," which will take the delegates and their ladies and guests on a three-day cruise, probably into Georgian Bay. The Detroit Transportation Association, which will act as host to the national convention, is now receiving reservations.

ROOSEVELT HIGHWAY SURVEY

A. W. Tracy, Duluth, official of the Roosevelt Highway Commission, will have completed a general survey of the eastern section of the 3,000-mile highway when he arrives in Manistique next week. The trip was made to see that all facilities for traffic over the highway were in shape for the opening of the season.

D. T. A. IN NEW QUARTERS

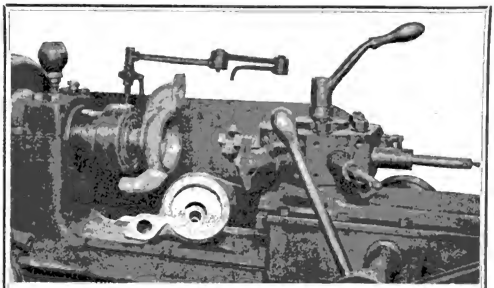
Members of the Detroit Transportation Association held their first meeting in their new quarters, Tuesday evening, April 18. Costs were discussed for various kinds of equipment and operation.

The quarters occupy the entire second floor of the building at Third avenue and Howard street, with approximately 15,000 square feet of space. The offices were modeled and altered by the association itself, and contain a large room for the board on which business is cleared, an office for Secretary F. L. Henk, a directors' room and smaller compartments for files, cloaks and a refreshment room. The offices are the largest in the United States devoted exclusively to cartage interests.

BUS SERVICE EXTENSION

Three bus services will be operated or expanded at once in rural sections of Michigan.

R. L. Burger, Belding, has started a motor bus line between Belding, Ionia and Portland and plans two round trips daily.



L. B. Shance & Son, Potterville, operating a line between Lansing and Charlotte, has purchased two Duplex trucks, which will go into service about May 1.

The Houghton County Bus Company will resume at once motor bus service for the summer season. It will operate between the Portage and Torch lake districts.

CLARK PAINTINGS ON TOUR

One of the features of this year's automobile shows was the set of twelve paintings, "The Spirit of Transportation." These canvasses, which were made by twelve foremost American artists under the auspices of the Clark Equipment Company, Buchanan, represent the artists' conception of the development of transportation.

The National Automobile Dealers' Association has now taken over these paintings and has arranged to exhibit them this year in the principal cities of the country, as a means of furthering the automotive industry and automotive transportation in particular. In each of the cities a joint meeting of the automobile dealers' association, the clearing house association and the chamber of commerce will be held and addresses made by business men, on subjects such as the following: "The Automobile and the Motor Truck—A New System of Transportation;" "Increase of Land Values Due to the Use of the Automobile and Motor Truck," etc. At present the paintings are being shown in Seattle, Wash. Ezra W. Clark, advertising manager of the Clark Equipment Company, is accompanying the paintings during the next two months, having donated his services for a lecture tour to the N. A. D. A.

The hub of this Cast Iron Water-Circulating Pump-Body has been turned and drilled on another No. 4 Turret Lathe. The tools on this No. 4 rough bore and true up for shaft, ream to size, counter-bore for clearance and finish bore and face large diameter—all in 5½ minutes. Most of these tools are standard.

WILLYS-OVERLAND'S PROGRESS

The Toledo factories of Willys-Overland, Inc., were brought up to a full time schedule this week, according to announcement of Charles B. Wilson, vice-president, and will continue to be so operated. The working force now numbers 5,000, with 7,000 the goal by the end of this month.

NIGHT SHIFT ADDED

Word from Greenville is that owing to the rapidly increasing demand for the products of the Michigan Motor Garment Company, a night shift has been started in some of the departments. About 150 persons will be employed at the plant.

TRANSPORTATION NEWS

Rail :: :: Water

Alma—The report is current here that the Pere Marquette will put up a new station in the city some time this year. The present structure is declared to be old and inadequate.

Benton Harbor—The steamer City of Grand Rapids, of the Graham & Morton line, opened 1921 navigation between Benton Harbor, Holland and Chicago, April 17. Three trips a week will be made.

Grand Rapids—The following directors were elected at the annual meeting of the Grand Rapids & Indiana Railway Company, here, a few days ago: Clay H. Hollister, William R. Shelby and W. Miller Wardrop, all of Grand Rapids; Samuel Rea, Philadelphia, and J. W. Orr, Charles M. South and James J. Turner, of Pittsburgh.

Washington—In the case of the Peerless Portland Cement Company, Union City, Mich., vs. The Director General of Railroads, as agent, and the Michigan Central Railroad Company, the Interstate Commerce Commission has decided that the rate of $15 a ton for intrastate transportation of wet marl, in carloads, from Spring Arbor to Union City, Mich., during federal control, was unreasonable to the extent that it exceeded $7.50 per car. Reparation was awarded. The case, which was No. 11299 on the Commission's docket, was submitted on March 18 and decided March 21, 1921.

St. Joseph—St. Joseph will have a steamship line of its own again this season. The Theodore Roosevelt has been obtained under charter by the E. P. Farley Company, a corporation of Chicago and St. Joseph capital. Daily trips will be made by this big excursion steamer, which will leave Chicago at 9:30 a. m. and St. Joseph at 4:30 p. m. W. T. Mullen will be the local manager. Will H. Cochrun, former general manager of the Chicago-South Haven Steamship Company, will have charge of the Chicago docks. The local company chartered the Roosevelt when other cities, including South Haven, were bidding for it. The vessel is one of the fastest and finest excursion steamers on the lakes. Its gross tonnage is 1,955, with net tonnage of 1,330. The ship's length is 275.6 feet, and the beam 40 feet. The boat was built in 1906 in Toledo. Capt. J. H. Clark is commander.

Washington—That some reduction in railroad rates will be made soon is indicated by a statement from Secretary of the Treasury Mellon to the effect that new rates on certain commodities will be asked in a petition to the Interstate Commerce Commission, and very probably will be approved.

Washington—Rep. Sweet, Ohio, has announced that he will introduce a bill in Congress so amending the Transportation Act as to restore to the Interstate Commerce Commission its original authority to adjust rates, the effect of which would be to repeal that section of the act which provides that rates shall be sufficient to yield a return of at least 5½ per cent on the federal valuation of the properties.

Washington—The Interstate Commerce Commission has decided (Investigation and Suspension Docket No. 1232—Coal from Illinois to Michigan) that the proposed cancellation of joint rates on coal from mines on the Minneapolis & St. Louis Railroad in Illinois to destinations in Ohio and Michigan is not justified, and has ordered the suspension schedules cancelled. The case was submitted March 16 and decided March 31, 1921.

Springfield, Ohio—Announcement is made here by a representative of the Detroit, Toledo & Ironton Railroad, owned by Henry Ford and his son Edsel, that a fast passenger schedule will become effective May 1, when an hour will be cut off the run between Springfield and Ironton. For the present steam engines will be used. Later Ford's motor driven cars will be substituted for passenger traffic. It was stated that on the inspection trip recently Ford's motor driven car made the run from Springfield to Detroit in five hours.

Lansing—According to the reports of local railroad companies, both incoming and outgoing freight is increasing here, while better service is now being given, with more labor available. The Grand Trunk freight office agent reports a gain of 50 per cent over the two preceding months.

STRONG, CARLISLE & HAMMOND MOVE

On and after April 25 the Detroit branch of the Strong, Carlisle & Hammond Company, dealer in machine tools, will be in its new office and warehouse at 1300 Fort street west, where it will be situated to serve its customers in a better manner than it ever has been before. The company has for five years been located in the Dodge building, 410 Jefferson avenue, but owing to the fact that this building has been leased to the Grand Trunk Railway for office purposes, it was necessary for the Strong, Carlisle & Hammond Company to move to new quarters.

At the location at 1300 Fort street west the company will have 10,000 square feet of space all on one floor, well lighted, located centrally to all freight depots, and with its own freight elevator.

J. L. Whitehead, manager of the Detroit branch, is one of the best known men in the machinery business, in which he has been engaged a number of years.

FLINT C. OF C. ELECTION

Directors of the Flint Chamber of Commerce have elected Arthur G. Bishop as president for the ensuing year. Mr. Bishop is one of the best known members of the Chamber and is one of the charter members of the organization. Charles H. Bonbright, president of the Imperial Wheel Company and Flint Motor Axle Company, was chosen first vice-president, and Dr. Jesse H. Beckwith, who has been prominent in many local campaigns, was elected second vice-president. L. H. Bridgman, of the Union Trust and Savings Bank, was re-elected treasurer. Mr Bishop succeeds Floyd A. Allen.

CONSERVING MICHIGAN TIMBER

Present methods of forest taxation in Michigan vie with forest fires in depleting the state's available timber supply, according to the Michigan State Farm Bureau forestry department, located in Lansing. The department is conducting a campaign to conserve the timber supply by urging adequate fire protection for the forests and cut-over lands. In conjunction with the leading foresters of the state, the department has prepared a plan for giving fire protection to 3,000,000 acres of timber land and 7,000,000 idle acres, 60 per cent of which, it is declared, would reforest themselves if properly protected. The plan was drawn for the new state department of conservation. It provides for a chief forest fire warden with three district fire wardens and forty trained forest fire rangers, to devote their entire time to fire protection. They would also assist in forest propagation and perform other duties.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Marysville—The Monarch Pattern Works, 1426 Russell street, Detroit, has bought a factory site 40 by 100 feet in Marysville. Building operations will be started as soon as business resumes its normal swing, according to H. J. Chandler, secretary-treasurer of the company.

Grand Rapids—During the week ended April 1, 74 permits were taken out. This is nine more than for the previous week, which was the record week so far this year. The permits represent an expenditure of $89,380. Fourteen of the permits were for new construction and the cost involved is $69,300. March permits totaled 255, which is 75 in excess of the number taken out a year ago. However, the cost of the buildings this year was $348,047, as compared with $600,850 last year. Permits issued during the first quarter of this year totaled 480 and involved an expenditure of $815,717, as compared with 301 permits for the corresponding period in 1920, when the expenditure was $1,346,846.

Detroit—Practically all the work awarded by architects during the week ended April 14, as reported by the Builders & Traders' Exchange, was in the nature of sub or additional contracts. For instance, the Lanquist-Ilisley Company let the remainder of contracts for the 15-story Stroh building, these being for fire escapes, marble, mail chutes, painting and glazing. Raseman & Freier let the contracts for roofing, painting, plumbing and heating, mason work and stone on the factory building being erected on Plum street for the Detroit Color Type Company. Schools and church buildings were other jobs mentioned. Concerning projects for new construction in the hands of architects, the Builders & Traders' Exchange makes the following announcement: "The month of April started off fairly well in the way of new construction. A number of good-sized projects were reported, as follows: A brick and steel branch bank building for the Peoples State Bank; a brick and frame factory building; a one-story and basement store building; a brick and steel school building, to be erected on the present Nordstrum site; the completion of the Marr school; completion of and addition to the brick power house for Harper Hospital; a one-story and basement, brick and steel branch bank building for the American State bank; a ten-room brick and steel school building, to be erected at Gratiot avenue and Grotto road, and a variety of smaller projects.

Detroit—One hundred three and four-room houses are to be constructed in Royal Oak township, at Nine-mile road and John R. street, east of Ferndale, by B. F. Stephenson, real estate dealer. There are now 1,000 inhabitants in this section and a school recently built has an enrollment of 200 pupils.

Kalamazoo—Owing to the refusal of the bricklayers to meet with the employers and attempt to settle the strike started two months ago, the contractors have declared for the open shop under the American plan, with wages reduced from $1.25 to $1 an hour. Work will be resumed and if local men do not supply the demand for labor, men will be brought into the city.

Lansing—According to the present early activities, all building records in Lansing will be passed this year. Already the number of building permits is exceeding those for the same period last year, and work has been started or soon will be on several large structures, in addition to many new homes. The total number of permits during March was 164, or forty-five more than during the same month last year. The total estimated expenditure for these is $240,501, including those for the erection of a detention hospital at a cost of $51,000 and a rest house at Potter park at a cost of $21,000. During two weeks in April permits were issued alone for the construction of 82 garages. The Reniger Construction Company reports a busy season ahead. It is rushing work on the Allan A. Post addition to the Edward W. Sparrow hospital and also the East Junior high school. Structural steel work has been begun on the Lawrence bakery. H. A. Reniger, secretary-treasurer of the company, believes a good share of the building this year will be of a commercial nature, including churches, schools, banks and industrial structures.

Detroit—The commissioner of public works will advertise next week for bids on the sale or lease to the municipality of a cement manufacturing plant capable of producing 400,000 barrels annually. Permission for the purchase was voted at the election April 4.

Detroit—The Wyandotte Portland Cement Company, Wyandotte, on rid vertised bids for 175,000 barrels of cement wanted by the city of Detroit, has made a bid of $2.22 a barrel and furthermore offered to refund $15,000 as a price adjustment on existing contracts if its bid is accepted. In addition, the company agrees to give the city the benefit of any future reductions. In February the city rejected bids which called for $2.41 a barrel.

State Cartage Association Is Proceeding Aggressively

[By Staff Correspondent]

LANSING, April 20.—No time is being lost in perfecting the organization of the new Michigan Highway Transportation Association and in directing attention to the necessity for immediate action to prevent the passage of adverse legislation by the Michigan legislature.

Secretary H. H. Hardy has arranged his office system so as to take care of inquiries and all other business of the Association. This week he mailed out about 200 letters to truck owners, pointing out the advantages of the Association. This was the opening gun in the campaign for membership, and it is expected that the new organization will be able to boast shortly of having enlisted all the leading truck owners of Michigan. Mr. Hardy reports that much interest is being shown and that he has received numerous inquiries.

That the formation of this association has come just in time to save this growing business from the attacks of legislators is also emphasized in the letters sent out by Mr. Hardy. In his communication he outlines four bills which have been introduced either in the House or Senate, and which would injure all truck and bus owners and operators. Senate Bill No. 279 and House Bill No. 323 provide for a tax on buses and trucks and all such motor vehicles operated upon the public highways for profit. This tax amounts to five per cent on the gross income, and is opposed by the Association as unfair and too heavy, a tax that may result in driving many out of business. A third bill is No. 341 in the House, which would limit trucks to a total gross weight of twelve tons, including truck and load, and all trucks to a load not to exceed the rating of the manufacturer. Thus with a three-ton truck no more than three tons could be carried. The only exception is two-ton trucks with pneumatic tires.

The Association secretary states that many manufacturers purposely underrate their trucks, and consequently such a bill would be a handicap to truck owners and operators. Still another bill that would affect trucks adversely is the House Bill No. 549 providing for a tax of one cent a gallon on gasoline and other volatile liquids for use in motor vehicles. This would bring a still greater tax upon the commercial motor vehicles.

Thus, it is pointed out, the truck owner is faced not only with double, but even treble and more taxation. It is such dangers that the Association must fight, besides joining in moves to improve highways and conditions generally.

MULLINS CONSIDERS DETROIT

It is reported that the Mullins Body Corporation, Salem, O., has taken an option on a factory building in Detroit and will remove at once to this city. The plant formerly occupied by the Cadillac Motor Car Company is mentioned in the deal, but confirmation is lacking. The reason for the withdrawal of the Mullins concern from Salem is said to be labor troubles, the company desiring to operate the plant on a nine-hour basis, which the workers refused to accept. A lockout followed and the factory was closed.

ASK GMC TO OPEN TRANSFER OFFICE

Representatives of the Detroit brokers are said to be endeavoring to obtain a transfer office in Detroit of the General Motors Corporation whereby stock purchased on the Detroit Stock Exchange may be transferred. At present stock is sent to New York for transfer and besides a delay of three or four days a payment of New York taxes is required. With a local office there would be no such delay of taxes and it is believed that such action would stimulate trading here.

DETROIT, SATURDAY, APRIL 23, 1921

Judge Gary on Labor Unionism

IF a clear, concise, dispassionate statement of the case against labor unionism has been lacking, it has been supplied during the last week in the report of Judge Elbert H. Gary, chairman of the board of the United States Steel Corporation, to the corporation's stockholders. With the skill of a surgeon who searches out and brings to light a diseased part in a remote recess of the human frame, Judge Gary has thrust aside each extraneous issue and lifted out to the public gaze the very heart of the matter, which is the needlessness of labor unions —the fact that whatever call there may have been for them in other years, that call long since has ceased to be heard, and that the unions, therefore, remain only as a curb on individual initiative, a weight about the neck of industry, increasing costs of production and therefore costs to the public.

Judge Gary, after asserting that the Steel Corporation has always paid its workmen as high, if not the highest compensation of any basic industry, and accorded them as generous, if not the most generous treatment (wages and treatment, he declares, which have been no more liberal than the men deserved), predicates his analysis of the present status of unionism by the assertion that, "as stated and repeated publicly, we do not combat, though we do not contract or deal with, labor unions as such." Thus he makes it clear that he does not appear in the role of a prosecutor, but as an analyst.

"I believe," he says, "they (the unions) may have been justified in the long past, for I think the workmen were not always treated justly; that because of their lack of experience or otherwise they were unable to protect themselves, and therefore needed assistance of outsiders to secure their rights."

"But," he continues, "whatever may have been the conditions of employment in the long past, and whatever the results of unionism, there is at present, in the opinion of the large majority of both employers and employes, no necessity for labor unions, and no benefit or advantage through them will accrue to anyone except the union labor leaders."

In support of the statement that the great majority of employes see no need for unions, Judge Gary cites the fact in the United States not more than ten to fifteen per cent of labor is, or was at its highest point during the war, actually included in membership of the unions, and he adds that "the workmen do not voluntarily join the unions, do not seek the opportunity, do not search for leaders to form and maintain organizations; but, on the contrary, self-appointed leaders, who expect to receive a pecuniary profit, have been and are constantly and persistently soliciting the workmen to become members. The leaders create and maintain the organizations at the expense of those who are actually workmen and join through intimidation, over-persuasion, false promises, misrepresentation or because of the use of other vicious or unworthy methods."

Moreover: "It is the common belief that the workmen, as a rule, know nothing and have little to say in the management of the affairs of the unions. Therefore it is plain that the public speaker or writer who assumes that the union labor leaders represent labor as a class is mistaken, first because a comparatively small percentage of labor is connected with the unions, and secondly, because a relatively small number of members of the unions actually participate in any action taken.

"If the workman referred to assents to the demand to join the union then what happens? He pays the dues required and the assessments made from time to time by the leaders. He works where and when the employer decides, provided only the union consents. He must live up to the rules, instructions and conditions of the leaders. The hours must not exceed the number consented to by the leaders and the output of the workman must not exceed the limit fixed by them. However skillful the workman may be or become, he cannot be promoted to a better job or position except for seniority in time of employment. He may labor for months or years in a low wage or salaried position, though entitled by skill to earn a much larger amount. He cannot advance on merit. He is an instrument, a tool, of the union. If for some trivial cause or even an immoral one, such as the discharge of a lawbreaking fellow employe, a strike is called, this particular workman must quit, even though his family is in need of the compensation he would receive if working.

"The workman, if he belongs to a labor union, becomes the industrial slave of the union. He has no power of initiative or opportunity to apply his natural and physical capacity.

"The natural and certain effects of labor unionism are expressed by two words—inefficiency and high costs. And be it remembered that in the end the general public, which is more interested in selling prices of all products, must pay for the extortionate, unnecessary and unreasonable costs of production. It is primarily, fundamentally and finally interested in the existence and conduct of labor unions."

There you have the employer's case, and the public's case, against labor unionism.

Abolish the Comptroller

THE PROPOSAL at Washington to transfer the duties of the Comptroller of the Currency to the Federal Reserve Board should be given careful consideration by the banking fraternity. In the old days bank examination consisted mainly of counting money and adding up lists of notes to determine whether the actual assets balanced with the books. It was much the same with bank liabilities, the operation consisting of taking trial balances of the ledgers. Beyond this, examiners were more concerned in collecting their fees and catching the next train.

But with the growth of banks, and owing to experience with excessive loans, came stricter laws regarding investments which called for more attention by the supervisory authorities. And since the time when national examiners were changed over from the fee basis of pay to the salary basis, the trend of their first attentions has been steadily toward examining the solvency and liquidity of national banks, notwithstanding that the auditing feature of their work has been broadened from time to time.

Furthermore, before the advent of the Federal Reserve Banks, the city bank carried loans for the country bank, and the central reserve banks carried loans in turn for the city bank, the question of condition of any borrowing bank being one of prime interest to the lending banks. But the agency which was in position to know the particulars was restrained from giving the lending bank the benefit of its information. With the changes due to the advent of the Federal Reserve Banks there has come a growing disposition on the part of member banks to borrow from the Reserve Banks. In fact during the last four years nearly all member banks have had occasion to borrow from this source. By law Reserve Banks have had authority to examine member banks but the real work has been performed by an almost independent agency, the Comptroller's department, and if it so happened that the

Digitized by Google

Comptroller did not choose to work in harmony with the Reserve Banks, the latter did not receive any more assistance than the law provides. Moreover, the big advantage of gaining first hand information has been largely lost due to the triple system of supervision.

Another advantage that comes to mind is the economy to the federal government by having one agency instead of two; but above all, if the Reserve Banks take over in toto the examining machinery of the Comptroller, they will be in better position to prevent unsafe and unwarranted extension of credit. The Reserve Banks, moreover, will be in a position to prevent pyramiding. The loophole now existing by reason of two kinds of incorporated banks and three supervising agencies will be narrowed down to a point where only non-member banks will fall without the direct scrutiny of the chief lending power and credit source of the country, the Federal Reserve Banks.

There is plenty of argument against concentrating too much power in the federal government. The plan of having state and national banks of independent charter authority for several good reasons should not be abolished, yet there are more good reasons why a central authority should be informed in detail about the credit transactions between the two. Any arrangement which will inure to the safety of lending banks and to the security of depositors should receive vigorous support. There does not seem to be anything in this proposal which materially alters the existing legal relations between all parties concerned, but it does mean simplification of the machinery of supervision; likewise efficiency and economy.

Punishment

THE NIGHT was pitch dark, and it was raining. A clumsy searchlight manipulated by a Dutch policeman cut a cross section in the slanting storm and revealed a bent, sobbing old man with a white beard and drooping mustache helping his daughter up the steps of a railway carriage at Doorn, Holland. Up in front, four or five men, one of them an undertaker, were putting a coffin aboard. The box was heavy and the bearers were having quite a struggle with it. Finally they got the end of it into the coach and pushed it in, arm length. It grated and squeaked as it slid in on the floor. A trainman pushed the door shut with some clatter. Two or three younger men followed the old man and the woman into the coach. The curtains were drawn. Silence for a few minutes, except for the pelting of the rain and the growls of a Dutch constable, holding back the morbid, who would have picked the train to pieces for souvenirs.

Presently the door of the coach opened and a young man descended, turned and half lifted the old man out. Two other men hurried over and hooked their arms through his. They helped him along, stumbling and moaning, to a closed automobile waiting at the edge of the station platform. The younger man stepped into the car and the machine was driven away through the rain and mud.

The old man was William Hohenzollern, once kaiser and king, master of a hundred millions of souls and monarch-to-be (so he thought) of world empire. It was he who drew a new map of the inhabited universe with his sword and called out his human cattle to be quartered to make the map good; who, to realize his ambition, gave sanction to the butchery of women and little children; who horrified the savages in his entourage by the tortures he countenanced and brought the blush of shame to Attila and his Huns; who called upon God to witness his magnificence.

This night, in the rain and the storm, he turned back to his exile while alien hands bore back to the Fatherland what was once his royal consort. He could not pay her the last fond measure of devotion because, being a criminal, the hand of man was set against him, and he must go back to his prison.

Willian Hohenzollern was beginning to pay the price.

Short Measure Stuff

CONCERNING "SYNOPSIS OF PREVIOUS CHAPTERS"

WHO writes the "Synopsis of Previous Chapters" for our serial stories? Whoever they are, they should receive some recognition. These masterpieces are too often read and forgotten in the search for plot continuity and action. Yet they are more mysterious than the most mystifying mystery; more graphic than the most hair-raising tale of adventure. They have only one drawback, and that is that they never give any inkling of what has happened in the tale or what is about to happen.

Here is what might be a typical specimen:

"Gloria returns from college to find her father about to be ruined. Oswald leaves his study just as she enters and is told that unless she waives her dower rights to his estate, and promises to marry the handsome stranger, her mother will divorce him. She pleads for mercy but the butler only sneers and hints darkly about the peril to her handsome lover. Finally, in despair, she goes to call on Bernice, who sobs out the story of the whole hideous affair. Returning home, she meets Bob, who takes her hand tenderly in his and asks permission to call on her parents that evening and ask for her hand in marriage."

CHAPTER XX

As the yacht neared the Ozarks Clementice came on deck.

"Good morning, captain," she chattered. "And where may we be now?"

The captain looked down at her quizzically. He had dangled her on his knee when she was but a little girl and he thought darkly of the dangers and sorrows which hung just over her head, or somewhere

No Time for the Metric System

A READER of the paper who is very much opposed to the compulsory adoption of the metric system of weights and measures in the United States—an end sought by a powerful group—calls attention to the fact that the propaganda in favor of the change is meeting with determined and widespread editorial opposition. He says he is glad to note the length and streugth of the battle line.

It may be remarked that, while the metric system undoubtedly has several features to commend it, this is hardly the time to move for its adoption. Business in this country has problems enough just now without having to encounter another involving the multiplicity of changes that would be necessary to a shift from the present system to that based upon the decimal point. Not only would there be endless confusion, but the expense involved would be staggering—enough in thousands of cases, no doubt, to throw manufacturing corporations into insolvency.

Some reforms, while desirable at certain times, are absolutely destructive in other periods. We are passing through one of the other periods at present.

FINANCIAL

A Proposal for Bettering Detroit's Finances—Deflation Process Shown by Bank Reports

By PHIL S. HANNA

THERE HAS BEEN much puff about improved conditions in Detroit. We read today that one plant adds 1,000 men. And we learn next day that the same plant laid off 900 the day previous. Criticism has seemed to center on the banker, and yet scarce are the proposals for bettering conditions.

The fact is that liquidation of loans by borrowers has not kept pace with the decrease in deposits and the banks as a result are carrying now practically the same amount of borrowed money obligations that they carried in December and are obliged to carry on a "defensive" campaign against new business rather than to conduct an "offensive" program wherein new loans could be extended to stimulate business.

We present below figures comparing conditions on December 2, 1920, with those April 7, 1921, which bear out the statement, and there is also shown what the condition might be if the betterment plan can be carried out:

	Deposits	Borrowed Obligations	Loans	Ratio of Borrowed Money to Loans
December 2, 1920	$412,000,000	$64,000,000	$401,200,000	15.9%
April 7, 1921	375,000,000	65,153,000	381,300,000	17.1%
	Dec. $37,000,000	Inc. $1,153,000	Dec. $19,900,000	Inc. 1.2%
	($375,000,000	$15,153,000	$347,300,000	*4.4%

*If $50,000,000 of bank loans were funded into securities and sold outside of Michigan.
*Normal.

The borrowing public can not expect Detroit banks to "loosen up" either until liquidation proceeds enough faster than fall in deposits to enable the banks to pay off a substantial portion of their borrowed money, or until deposits increase enough to permit of their cutting down obligations incurred to carry loans. There are two ways in which this may be done: Borrowers can go outside and get the money to pay off local banks or outside deposits can be brought in. The former has some undesirable features in that it encourages doing business away from home, but there are many cases wherein corporations should find it possible, some of their local bank loans by selling notes to investment bankers who will sell those notes (or bonds) to investors in parts of the country that have a surplus. The Federal Reserve Banks were never intended for carrying indirectly, through the medium of rediscounted paper, originating in commercial banks, loans which are apt to run for any considerable time. And it is the opinion of those in close touch with the local situation that if the aggregate of "capital loans" now being carried by the Detroit banks could be shifted to investors (who are not depositors in Detroit) the local banks could pay down their obligations to the Federal Reserve Bank, and the lightening of the credit load would bring about such a relation between deposits and loans that once more they could look to making new loans to business.

For an example, take the figures given above for April 7. Suppose $50,000,000 of loans were funded into bonds or term notes and some of our energetic investment bankers sold these securities outside of Michigan. Borrowed money obligations would fall to $15,153,000 and loans would fall to $331,300,000, which would give the banks a leeway of (375 less 331) $44,000,000 between deposits and loans and would reduce the proportion of borrowed money to loans from 17.1 per cent as it stood April 7 to 4.4 per cent, which would be a normal and healthy condition. And the chances are that the impetus which the lessening of the strain, and the new loans which could then be made, would give business a new lease on life. It would be a real step forward to see such an attempt made by some of the heavy borrowers.

* * *

Eight hundred and twenty member banks of the Federal Reserve System, April 8, 1921, show a reduction of $1,411,700,000, in total loans and investments as compared with October 8, 1920. The reduction of borrowed money obligations and deposits in the same institutions for the same period was $1,443,573,000. Cash and reserve fell from $1,761,150,000, October 8, to $1,568,485,000, April 8. The comparisons follow:

	Deposits	Borrowed Money Obligations	Loans and Inv.	Cash and Res.
October 8, 1920	$14,255,542,000	$2,242,562,000	$17,167,604,000	$1,761,150,000
April 8, 1921	13,131,345,000	1,630,576,000	15,756,904,000	1,568,485,000
	Dec. $824,197,000	Dec. $619,376,000	Dec. $1,411,700,000	Dec. $192,665,000
	619,376,000			
Decrease in liabilities	$1,443,573,000			
Liquidation of loans and investments	1,411,700,000			
	*$31,873,000			

*Amount by which liquidation of loans has fallen behind deposit loss.

The ratio of total borrowed money obligations to total loans and investments of 820 banks, whose figures are reported above, fell from 13.1 per cent on October 8, 1920, to 10.3 per cent on April 8, 1921.

* * *

The condition of the Federal Reserve Banks taken as a whole continues to improve, due to a $25,000,000 decrease in note circulation and continued gold additions, although a loss of $19,600,000 silver and an increase of $9,600,000 in deposits prevented more than a slight rise in reserve-deposit ratio, which advanced from 53.5 per cent to 53.7 per cent over the previous week.

An interesting feature of the reserve banks loans is brought out however by comparing total of member banks bills held now with the total held a year ago.

A year ago (April 16, 1920, to be exact) member banks had borrowed $1,430,888,000 on United States bond collateral and had rediscounted $980,303,000 of their own paper, making a total of $2,411,191,000. Today (April 15, 1921), the first item has dropped to $929,186,000 and the second item has increased to $1,175,368,000, making a total of $2,104,-544,000 now against $2,411,191,000 a year ago, a reduction of $306,637,000. This is a good measure of the extent which the member banks are paying up the reserve institutions.

* * *

The Chicago Reserve Bank made a handsome gain in reserve-liability ratio, increasing the same from 45.6 to 48.7, due largely to a gain of about $21,000,000 in reserves and a combined decrease of about $6,000,000, in note circulation and deposits. It is notable also that the earnings assets of the Chicago bank dropped off $26,000,000 in the week between April 8 and April 15. At this rate of liquidation of earning assets it will take only fifteen weeks to retire all the earning assets of the Chicago bank and instead of complaints about too much earnings there will be inquiry about better earnings.

* * *

Volume of business as shown by clearings and bank debits continues to show decreases. One hundred fifty-eight principal cities reporting show total debits for week ended April 13, 1921, of $7,197,489,000, as against $7,787,579,000 for the week ended April 6, 1921, and compared with $9,684,923,000 a year ago, April 14, 1920. Compared with a year ago the reduction is about 26 per cent. Index number of prices a year ago was 240 against 176 now, a similar percentage. The reader may draw his own conclusions.

GRAND RAPIDS FILTRATION PLANT

The Grand Rapids City Service Commission has floated $510,000 of bonds, of which $100,000 will be used to building a new filtration extension. One hundred fifty thousand dollars will go for water main extensions and $230,000 for street improvements.

NOBLE OIL REMOVED FROM LIST

The board of governors of the Detroit Stock Exchange has removed from the listed section the preferred stock of Noble Oil Company because, according to announcement, the company failed to notify the Exchange that payment of both common and preferred dividends due April 15 had been indefinitely deferred.

CITIES SERVICE EARNINGS, 1920

For the year 1920, earnings of Cities Service Company were $43.09 a share on the common stock, as against $39.09 for the year 1919

STANDARD PARTS FINANCE PLAN

Advices from Cleveland say that the Standard Parts Company is no longer operating at a loss and that business now amounts to about $1,000,000 a month. The new financing plan, formulated last week, contemplates a new company and a note and stock issue to take over the various subsidiary properties including the Perfection Spring company, Cleveland; Pontiac Spring company, Pontiac, Mich.; Standard Welding Company, Cleveland; Bock Bearing Company, Toledo; Eaton Axle Company, Cleveland, and the Canton Forge Company, Canton, Ohio.

LANGDON JOINS LAW FIRM

John H. Langdon, manager of the Detroit Clearing House Association, and an attorney of some six years' standing, has become associated with Jorgensen & Alexander, with offices at 724 Dime Bank building. The name of the new firm is Jorgensen, Alexander & Langdon. Mr. Langdon advises that his new connection does not mean giving up his post with the clearing house, which he has held for several years.

Business Meets New Conditions

American business has been clearing decks. Budgets have been revised. Every buying, selling and production unit has been overhauled and made ready for intensive service. Economy has been the test—economy of time and effort.

In any study of functions and readjusting of methods, the work done by your bank balance should not be overlooked. Has it been merely a checking account and a basis for commercial credit? Or has it brought to the aid of your organization other constructive services? Are you making use now of all the help it should provide?

Many business men who carry deposits with the Irving or with Irving correspondents have discovered broader service possibilities in their banking connections The Irving investigates markets as well as credits, expedites deliveries of merchandise as well as collections, supplements the information resources of its customers both in domestic and foreign fields. Every transaction it undertakes, either at home or over-seas, is handled with a clear understanding of business essentials as well as careful attention to banking requirements.

*Calculated on basis of net deposits and F. R. notes in circulation.

Banks and Bankers

WING'S HOLDINGS SOLD

The Grand Rapids Trust Company, executor of the estate of Charles Gordon Wing, founder and for nineteen years president of the Ludington State Bank, has sold the $25,000 par value of stock owned by Mr. Wing in Ludington business men, at $155 a share. The trust company also has sold the $5,000 of stock in the Bank of Fountain, owned by Mr. Wing, the purchaser being Howard J. Gregory, cashier of the bank. O. A. Starke, treasurer of the Star Watchcase Company, Ludington, who was one of the purchasers of the stock owned by Mr. Wing, in the Ludington State Bank, has been elected a director of the bank.

CAPITAL NATIONAL CHANGES

Coincident with the election of Frank E. Gorman as cashier of the Capital National Bank, Lansing, Albert A. Elsesser and Marshall A. Westfall were appointed assistant cashiers. The former is advanced from the credit department and the latter from the auditorship. Both have been with the bank more than six years. Robert Y. Speir, heretofore vice-president and cashier, becomes vice-president and manager, as told last week in these columns.

BRICKER GOES TO CASS CITY

Roy Bricker, who has been cashier of the State Bank of Harbor Beach since early in 1920, has been elected cashier of the Pinney State Bank, Cass City. The latter is a recent incorporation of the old Exchange Bank of E. H. Pinney & Son, which had operated as a private bank since 1886 and at last report had deposits around the three-quarter million mark. Bricker has had valuable banking experience and may be expected to give a good account of himself in the new connection.

The Cass City Bank, also a private institution, which has been in business in Cass City since 1882, has also incorporated under the title of Cass City State Bank.

Michigan Bond Items

Application has been made by the Pere Marquette Railroad Company with the Interstate Commerce Commission for permission to sell $3,231,000 first mortgage gold bonds, the money to be used for equipment purchases and improvements.

A resolution has been adopted by the Genesee county board of supervisors, at Flint, by which the county will borrow $3,400,000 for the construction of permanent roads and issue as security road bonds of $1,000 denomination. The bonds will be payable in the sum of $200,000 March 15, 1922, and $200,000 March 15, 1923.

The next twelve instalments will be paid on March 15, in the sum of $150,000 from 1923 to 1935. Six more instalments will be paid on March 15 from 1935 to 1941 in the sum of $200,000. They will draw interest at the rate

Digitized by Google

of five per cent per annum, payable semi-annually on March and September 15 each year until the bonds and interest are fully paid.

The first five will be withheld and retired from the annual tax payments and the other series will be sold to the highest bidder as fast as the progress of the work demands.

The $10,000,000 issue of Packard Motor Car Company bonds, marketed last week by a syndicate composed of the Guaranty Trust Company, National City Company and Montgomery & Company, New York, was oversubscribed in less than two hours. "The success of the issue may be taken as proof that public confidence in the automobile industry is unshaken," says a statement issued by Alvan Macauley, president of the Packard.

The Detroit, Toledo & Ironton Railroad Company has asked the Interstate Commerce Commission for authority to issue $182,000 of its first mortgage 50-year, 5 per cent gold bonds.

McPHERSON JOINS BANK OF DETROIT

A. A. McPherson, who recently became assistant cashier of the Bank of Detroit, has had a variety of business experience. He is a native Detroiter, born May 26, 1889. From 1914 to 1919 he was employed by the Old Detroit National Bank, doing all kinds of bank work, and for several years thereafter was office manager at Dodge Brothers. After returning from the Army in 1919 he joined the Oakland Motor Company as office manager, which position he resigned recently to join the Bank of Detroit as assistant cashier. It is understood that Mr. McPherson will concern himself with new business for the bank because of his large acquaintance in the city. It is interesting to learn that he was with Dodge Brothers when their first car was turned out, and handled their accounting affairs at that time.

A. A. McPHERSON

INSURANCE MERGER BLOCKED

An attempt of the Marquette National Fire Insurance Company to absorb the Columbian National Fire Insurance Company, Lansing, last week, resulted in a deadlock, following the issuance of a restraining order by Judge Collingwood to prevent the casting of 22,000 proxy votes in the hands of a committee, composed of T. A. Lawler, president, and J. E. Murphy, former secretary. The stockholders of the Lansing concern opposed the move. The court's order will prevent the amalgamation of the companies this year.

The annual statement of the Columbian company shows total assets of $1,981,305.41 as against $1,850,633.93 last year. Officers who will temporarily retain their posts are: Thomas A. Lawler, president and general manager; James J. Carey, vice-president; Joseph Gerson, chairman of executive board; William D. Lawrence, secretary-treasurer and auditor, and A. E. Hayes, assistant secretary.

KILLEN TO PAY IN FULL

The business of the Killen Kemical Kompany, Lansing, is rapidly improving under the receivership of Joseph Gerson. Mr. Gerson announces that all debts will be paid, and it is expected the firm will be on a paying basis within three months. More employes are being added and products are being shipped out daily. The affairs of the company are to be settled in the circuit court of Judge Leland Carr, June 27.

VALUE and ECONOMY

When this Company was organized in 1912 it was realized that in order to accomplish one of its principal purposes—to furnish economical insurance—it was essential that every element of unnecessary unproductive expense be eliminated.

Two such elements were immediately apparent—the profits required by the stockholders of a stock company, and the commission paid agents by such companies for the acquisition of business.

The first of these was automatically eliminated by the mutual character of the Company. Being owned and operated by its own members, what would be regarded as profits in a stock company became savings in the Michigan Mutual, belonging to the members and subject to distribution amongst themselves.

The second and more material element of unproductive expense was the commission paid to agents for their services in acquiring business.

Inasmuch as the law requires that all employers coming under the Compensation Act MUST have insurance, there was obviously no necessity for agents to point out the advantage of insuring. The only real service the agents were in a position to render was TO THEMSELVES and TO THEIR INSURANCE COMPANIES in securing business—NOT TO THE ONE INSURED.

Therefore it was determined to dispense with the services of commissioned agents, thereby effecting a saving of nearly 20 cents on every dollar of premium.

Naturally this placed our Company under a considerable handicap in its competition with those companies having a highly organized agency force, actuated by the motive of personal profit to secure business for their respective companies.

To overcome the influence wielded by such agents, through friendship, business connections and similar means, our Company was compelled to depend upon bare INSURANCE VALUE, ECONOMY and SERVICE.

How completely these three factors—value, economy and service—have been successful in overcoming competition, is conclusively proven by the records showing that today the Michigan Mutual writes more compensation insurance in Michigan than any other two companies combined.

Let us show how you, too, may put your compensation insurance on a THRIFT basis. Write now—TODAY. A postal will do.

Every policy non-assessable—every policy shares in savings

PONTIAC TO HAVE $15,000,000 BANK

Plans looking to the consolidation of the Pontiac Commercial and Savings Bank and the Oakland County Savings Bank have been announced. The former has assets of $11,000,000 and the later more than $4,000,000. It was stated in Pontiac Tuesday that Cramer Smith, vice president of the Pontiac Commercial and Savings Bank, will head the consolidation, and that Fred L. Perry, now president of the Oakland County, will become a vice-president of the new bank. Plans also call for closing up the present "Oakland County" office and the East Side office of the "Commercial" and concentrating the business hereafter in a new building soon to be erected. When this change is effected, which is expected about July 1, Pontiac will have three banks, instead of four. All of the present officers of both banks will be retained according to the announcement.

GOODYEAR CONTROL UNCERTAIN

It was unofficially announced in Chicago, April 20, that control and management of the Goodyear Tire & Rubber Company will pass from P. A. Seiberling, now president and general manager, to an investment bankers' committee as the result of refinancing plans definitely decided on. The new control will continue throughout the life of an issue of $30,000,000 first mortgage, 20-year, 8 per cent bonds, which will shortly be offered for subscription.

NOTE—Bank quotes omitted because changes are insignificant.

Weekly A. I. B. News

Examinations were held Thursday of this week at Central High School in Political Economy and Money and Banking. About 150 participated and the employes in each bank who took the best paper gets a free trip to the Minneapolis convention.

According to new by-laws recently adopted by the Detroit chapter, president and vice-president after 1923 must be graduates of the A. I. B. and hold the graduation certificate.

The nominating committee appointed by President Robert B. Locke to present a slate for consideration at the annual meeting May 21 has handed in the following names:

President—Frank Thomas, First and Old Detroit National.

Vice-Pres.—A. J. Charp, Peninsular State.

Vice-Pres.—Cecil S. Hunt, Detroit Savings.

Vice-Pres.—F. D. Lorimer, Dime Savings.

Secretary—Samuel Pipe, Bank of Detroit.

Board of Governors to serve one year:

Julius Rubiner, First state.

Geo. L. Bott, Merchants National.

William P. Niven, American State.

Charles Behrns, Continental.

George Y. Reed, Highland Park State.

A. W. Crowe, Detroit Trust.

Kenneth Paton, Detroit Savings.

Herman Hillebrand, Dime Savings.

Board of Governors to serve two years:

Grant D. Esterling, First and Old Detroit National.

Lee D. Heaphy, Peoples State.

Robert Lanier, Peninsular.

Clifford H. Hyett, Dime Savings.

A. C. Voss, National Bank of Commerce.

George J. Jarvis, Federal Reserve.

W. C. Hartwig, Union Trust.

By-laws provide that other candidates may be voted upon provided 15 members representing five banks petition the board of governors.

The annual meeting May 21 to be held at the Hotel Statler will be a gala event for the local chapter. In addition to the business meeting and dance there will be, according to President Locke, a number of "stunts" and other special entertainment features.

COMMERCIAL SAVINGS APPROVED

John Morton, formerly credit manager of the Dime Savings Bank, Detroit, who has been one of the moving spirits in the organization of the Commercial State Savings Bank, Detroit, advises that authority has been given at Lansing for the organization of the bank. An option has been obtained for July on the present quarters of the Detroit Savings Bank, according to Mr. Morton, and the bank will open shortly thereafter. Capital will be $1,000,000.

A. D. CRIMMINS MOVES UP

Alvah D. Crimmins, cashier of the Charlevoix State Savings Bank since 1917, has been elected cashier of the Grand Rapids National City Bank, effective May 15. Crimmins is one of the ahiest younger bankers in Michigan and has a wide acquaintance in banking circles. His successor at Charlevoix has not been announced.

Coincident with the election of Mr. Crimmins as cashier, Bertram Vander Meulen, since 1914 employed as transit clerk, becomes assistant cashier.

THE results of today's action in selecting sound investments will be felt for many years to come—especially as the buying power of the dollar grows greater.

Your investments should be dependable to the utmost degree—yet logically suited to specific needs—and *properly priced.*

Hence, in addition to an attractive list of bonds selected from today's unusual opportunities, we offer *individual service*—so that you can make a better and more advantageous choice than would otherwise be possible.

If we thought it would serve you, we would be glad to give you a general list of securities representative of the best in today's market. But we urge that you gain the additional benefits obtainable through careful analysis and *individual service.*

You can enjoy this attention and help by correspondence, if necessary. Address to us any inquiry you have in mind concerning bond investments. It will receive the same careful answer as an inquiry made in a personal visit. We desire this opportunity to suggest profitable investments.

NEW LANSING CREDIT EXCHANGE

The organization of the Lansing Credit Exchange was perfected last week. It will be affiliated with the National Retail Credit Men's Association. Offices will be established with a permanent secretary, and rating service will be given at once.

The officers elected are: President, John Affeldt; vice-president, John Daley; treasurer, R. C. Lynn; secretary of executive committee, Norman B. Cove. Fifteen local industries are represented on the board of directors, as follows: Carl Parker, automobile dealers; Robert Y. Speir, banks; John Daley, building material men; James O'Connor, clothing; R. C. Lynn, electrical supplies; Bert Miller, furniture; John Affeldt, groceries and meats; Cleo F. Baker, hardware; C. O. Sprowl, women's ready-to-wear clothing; A. J. Hagar, lumber; Joseph Gleason, paints and decorating; Thomas Shields, plumbing; F. E. Baker, retail merchants; Clarence Skinner, shoes; Evans Boucher, wholesale groceries. The new association has purchased the Grocers & Meat Dealers' Credit Rating bureau, and negotiations are pending for the purchase of the Business Men's Credit Association. Weekly bulletins will be issued.

McCRORY MARCH SALES

The McCrory Stores Corporation reports sales for March of $1,206,402, compared with $1,127,477 in the same month last year, and for the year to date $3,059,990, against $2,835,470 in the corresponding period last year.

LANSING STOCK MOVEMENTS

Two local stocks which moved more freely in Lansing last week than for some time were Auto Body and Motor Wheel, with plenty of buying orders for both. Prices offered for Motor Wheel, however, are not drawing out the stock, and local investors are riding with it. The corporation is doing a good business in all lines and has not missed a dividend either on common or preferred. The Reo Motor Car stock did its usual business during the week, while there was some demand and buying of the new Durant Motors, General Motors and Willys-Overland.

GENERAL ELECTRIC BUSINESS

Bookings of the General Electric Company so far this year are reported to be about 60 per cent of plant capacity. The company is located at Schnectady, N. Y. Unfilled orders at the end of 1920 totalled about $111,000,000.

NEW PLANT GOES INTO PRODUCTION

Operations have started in the new plant of the Ewing Bolt & Screw Company, one of the late additions to Detroit's growing industries, located in the River Rouge district. The company's products, screws, bolts and rivets, President Ewing reports, are of a staple nature, and used in large volume in practically every industry. He also states that orders now on the books will keep the factory busy for 60 days, and the outlook encouraging for additional and continued business. As the capacity increases, shipments will go to all parts of the country, and thus another enterprise finds Detroit an advantageous location.

LANSING TRADING HOURS

As Lansing did not adopt Eastern time, the local stock markets will open at 8 a. m. instead of 9, as has been the custom, beginning April 25. This change has been made necessary to conform with the opening of the New York markets at 10 o'clock.

The following were disapproved: Dikeman Parking Wheel Company, Detroit; International Cultivator Corporation, New York, N. Y., and Stafford Roller Bearing Car Truck Corporation, Carlstadt, N. J.

The Title, Guaranty & Casualty Company of America, Detroit, and Dattner Oil & Refining Company, Detroit, were reinstated.

WOOLWORTH SALES

During the first three months of 1921, sales of the F. W. Woolworth Company, New York, which operates 10-cent stores in a large number of cities, including Detroit, totaled $29,311,480, or $1,814,244 more than for the corresponding period in 1920. Out of the total, $11,830,973 is credited to March, the increase for the corresponding period in 1920. Out of the total, $11,830,973 is credited to March, the increase for the months being 9.02 per cent.

Foundation of Credit

Common knowledge regarding a firm's credit standing not only is beneficial to the firm but constitutes the foundation of the entire structure of credit.

The vast credit operations of the National Bank of Commerce in New York are safeguarded by virtue of a highly organized research of those conditions and facts which justify or limit credit.

The benefit of our extensive credit experience is shared with our friends.

FOR the first time in the financial history of Michigan a Bond House of the magnitude of this Corporation offers First Mortgage Bonds at a price to net 7%.

We feel that this is the best investment offering ever made in Michigan. You may now purchase a serial Gold Bond—a unit of a direct closed First Mortgage secured two to one by Detroit improved property—to produce 7%.

These bonds have been selling on a 6% basis.

Considering the collateral security, the tax exemption features, and the unqualified guaranty of this $7,000,000 Corporation—we feel justified in stating that at 7% these bonds are unexcelled.

SOO LINE HAS A DEFICIT

Gross earnings of the Minneapolis, St. Paul & Sault Ste. Marie Railroad Company during February amounted to $3,055,788, as compared with $3,481,254 in February 1920; $2,790,644 in 1919 and $2,936,901 in 1918. After deduction of taxes the net operating deficit was $638,326, as compared with a net income of $189,479 a year ago. For the first two months of 1921 the net operating deficit was $1,612,841, as against an income of $52,079 in 1920; $369,691 in 1919, and a deficit of $94,710 in 1918.

Land Titles and Title Insurance

(*Continued from Page 10*)

title. The attorney will now rarely attempt to make his own examination of the records but insists upon an abstract prepared by a responsible abstractor or abstract company. The purpose of the abstract, as it will be noted, is merely to present conveniently what the records disclose and to facilitate the forming of an opinion thereon. It follows that a perfect abstract is by no means an indication of a perfect title. The title may be absolutely bad; the perfection of the abstract consists merely in disclosing it as it is.

So a guaranteed abstract is merely an abstract which is guaranteed to show correctly the condition of a certain title, be it good, bad or doubtful. It is unfortunate that the nature of a guaranteed abstract is sometimes misunderstood, some people assuming that the possession of such an abstract assures a sound title. The making of an abstract, however, requires such painstaking attention to detail, such technical skill and such a comprehensive knowledge of real estate law that a very natural demand has arisen for a guaranteed abstract, as distinguished from one the accuracy and scope of which are not guaranteed. In other words, to determine the goodness or badness of a title, the first requisite is information the accuracy of which can be absolutely relied upon. To make an abstract of a sort is not particularly difficult, given a certain amount of experience and training. To make a perfect abstract, however, or to maintain such a standard in the making of it that the abstracter or abstract company can afford to guarantee it, is a different matter.

Advantages and Disadvantages

Instead of the attorney's opinion it may happen that an abstract company will itself give an opinion as to the title, such an opinion taking the form of a certificate that in its judgment the title is as indicated. These opinions when issued by abstract companies are commonly referred to as certificates of title. They have been but little used in Michigan, although commonly met with elsewhere.

The above are two of the plans designed to give a purchaser or other interested party assurance regarding a title. It might be well to comment briefly on the advantages and disadvantages of these and the other plans now in common use.

1. The Attorney's Opinion. As above stated, the attorney's opinion is commonly based upon an abstract though it may be based upon his own search. His opinion being an opinion merely and purporting to be nothing further, the attorney is, of course, not financially liable in case the opinion is erroneous, provided he has employed reasonable care and skill in its preparation. With many attorneys an opinion on a title is almost conclusive, with others, less able and experienced, mistakes will occasionally be made. Obviously, if based upon a faulty abstract, the opinion itself will necessarily be unreliable.

2. The Certificate of Title. This, in its ordinary form, is merely the formal opinion of a title company, and the same possibility of error and exemption from liability apply that have been noted above in the case of the attorney's opinion.

3. The Guaranteed Certificate of Title. This is an opinion given by a title company which differs from the ordinary certificate in that its correctness is guaranteed.

4. The Title Guaranty Policy (or policy of title insurance, as it is sometimes called). In the form commonly used, such a policy issued by a title company guarantees the record title to be as expressed in the policy with such

Digitized by Google

exceptions as may be noted. Provided the issuing company be responsible, this is without doubt the most complete assurance of a valid title that can be obtained. In the first place, the policy itself is predicated upon the opinion of an expert based upon as careful and skilful a search of the records as can be made. The issuing company then assumes complete financial responsibility for the correctness of its opinion, limited only by some maximum amount fixed by agreement when the policy is issued, and approximating the value of the property covered. The nature of title insurance is well expressed by the Court in the Pennsylvania case of Foehrenbach vs. German-American Title & Guaranty Company:

"The quality of a title is a matter of opinion as to which even men learned in the law of real estate may differ. A policy of title insurance means the opinion of the company which insures it as to the validity of the title backed by an agreement to make the opinion good in case it should be mistaken and loss should result in consequence to the insured."

As is indicated by the foregoing quotation, there is in real estate titles much room for divergence of views. This risk, as well as the risk resulting from error in the search, is assumed by the title company.

Another advantage possessed by the title guaranty policy is the promptness with which the policy can be issued. A title company can review its own records much more rapidly than it can furnish a complete and verified abstract. Keenly sensible though it may be of the desirability of quick service, a well managed company will not permit its work to be slighted even under the severest pressure—and few have any conception of what this pressure has been the last few years in such a community, for instance, as Detroit. With the title guaranty policy the necessary standard of accuracy can be maintained and more rapid service given.

To summarize, then, it appears that there is much room for the element of quality in an abstract, and, like the little girl in Mother Goose, "when it is bad it is horrid." We find that even with a good abstract the land owner is not protected without a competent opinion on what is disclosed therein. It further appears that for absolute protection a title guaranty policy is the ideal resource and that it admirably fulfills its purpose. A more general understanding of and familiarity with this convenient and inexpensive form of insurance would, it is believed, be much to the advantage of the public.

STANDARD OIL DIVIDENDS

During the first quarter of 1921 the Standard Oil Company paid out $29,021,070 in dividends, as compared with $26,935,000 for the corresponding period in 1920. This total is for the various Standard companies and subsidiaries. Standard Oil of Nebraska has just declared its third stock dividend since the dissolution of the old company in 1912. The latest dividend amounts to 200 per cent. In 1913 a stock dividend of 25 per cent was declared, and in 1912 a stock dividend of 33 1-3 per cent. The original capital of the company was $600,000 which has been increased until it now is $5,000,000. The profits for 1920 totaled $1,062,693 after taxes and charges, equal to $106.20 a share, says the Wall Street Journal.

CANADIAN PACIFIC RAILWAY

Gross income of the Canadian Pacific Railway for the year ended December 31, 1920, was $216,641,249, as compared with $176,929,060 in 1919; $157,537,698 in 1918 and $152,389,335 in 1917. Net after deduction of expenses and taxes was $33,153,044; $32,923,036; $24,502,388 and $46,546,018 respectively for the four years. After deducting fixed charges, adding special income, deducting preferred and common stock dividends the net surplus at the end of 1920 was $3,616,806, as compared with $2,093,593 in 1919; $2,532,372 in 1918 and $15,334,215 in 1917.

(No. 6 of a series of examples)

Is a Corporation Liable If It Permits a Person Holding Stock as Trustee to Transfer the Stock Contrary to the Terms of the Trust?

Yes. Where a transfer to another person, as Trustee, is made by the executors of a decedent, the corporation is thereby notified of the existence of the will and required to inform itself of the terms of the will and of the trust and is liable if it permits the transfer under circumstances inconsistent with the trust.

Stock is often trusteed under wills or trust agreements and many technical points should be guarded in any transfer of the stock. The matter is one which the corporation itself is rarely equipped to handle.

This Company is experienced in such matters and our officers will be glad to explain this service in detail.

DOING BUSINESS IN MICHIGAN

Example 5. The Phillips Company, a Wisconsin corporation, without first qualifying as a foreign corporation in Michigan, entered into a contract with the Springfield Realty Company to install a system of automatic fire sprinklers in a building located in Detroit. On failure to receive payment the Phillips Company filed a mechanic's lien on the property. Subsequently the realty company went into bankruptcy and the property was sold under an order of court free and clear of the lien. The Phillips Company appealed from the referee's decision that it was not entitled to enforce its lien, but the United States District Court upholds the referee's desicion, giving full effect to the Michigan statute which provides: "No foreign corporation subject to the provisions of this act shall be capable of making a valid contract in this state until it shall have fully complied with the requirements of this act, and at the time holds an unrevoked certificate to the effect from the Secretary of State." In re Springfield Realty Co., 257 Fed. 785 Corp. Journal No. 92.

Example 6. There is a distinction between qualifying in order to do business and qualifying under the so-called Blue Sky law in order to obtain permission to sell stock. In the case of Edward vs. Ioor, 256 Mich. 617, the court made the following statement: "Compliance with the Corporation Act permits a foreign corporation to 'carry on its business,' the business for which it is organized in the state: compliance with the Commission Act permits it to sell its stock and other securities. One is not in any way dependent upon the other. One foreign corporation may desire to carry on its business in the state but may not desire to sell stock; another may desire to sell stock but may not desire to carry on its business in the state. If a foreign corporation desires to carry on its business and also sell its stock in the state it is obvious that it must comply with both acts. It is equally obvious that if it desires to do but one of these things, it is required to comply only with the provisions of the appropriate act." 173 NW 620 Corp. Journal No. 92.

It is interesting in this connection to note that there is still another supervision and provision other than the so-called Blue Sky Commission in Michigan. The former was created by the banking laws to pass on certain securities which banks desire to carry as "savings department investments," and is created by Section 97, paragrapher section 8032 of the banking laws. It reads as follows: "There shall be a board of commissioners for the purpose of passing on the securities mentioned in paragraphs (e), (f) or (g) of section twenty-seven of this act, consisting of the commissioner of the banking department, attorney general and state treasurer—which shall be known as the securities commission. It shall be the duty of this commission, whenever an issue of bonds, which shall come within the requirements of paragraphs (e) and (f) of section twenty-seven of this act shall be presented to them, to examine into the financial conditions of the corporation issuing such bonds, and ascertain whether such issue is excessive as compared with the value of the property of such corporation, and if they shall find that such issue of bonds is not excessive and that they comply with the other requirements of said paragraph, they shall so certify in a book to be kept in the state banking department for that purpose, and thereupon said banks may invest in such bonds."

Who's Who In Michigan Finance

Frank E. Gorman, State Treasurer, and Cashier, Capital National Bank, Lansing.

IT IS GETTING to be a habit in Lansing to draft the state treasurers into the official families of the Lansing banks. And it is the more complimentary to them because there is a law prohibiting the treasurer from de-

FRANK E. GORMAN

positing funds in any bank with which he is connected. The latest state treasurer to be so honored is Frank E. Gorman, who has become cashier of the Capital National Bank, Lansing. Not many years ago John W. Haarer, who was state treasurer, became cashier of the City National Bank, Lansing.

Frank E Gorman has had a variety of experience, which promised well for his success as a banker. Born at Forrester, Sanilac county, he attended the local schools and eventually became a school teacher. He also worked in the general offices of the Edward Smith Estate, which practically owned the town of Forrester and which conducted a general store, dock, mill, lumber yard and produce handling business. About 15 years ago he went to Lansing and became bookkeeper in the state treasurer's office; then cashier. He was afterward appointed deputy state treasurer and finally elected state treasurer, which position he now holds in addition to being cashier of the Capital National Bank.

Gorman has many friends throughout Michigan and the new connection looks like a most desirable one for both parties to the transaction.

RAY CONSOLIDATED STATEMENT

The Ray Consolidated Copper Company made a net profit of $911,675 for 1920, as compared with $1,666,270 in 1919; $4,653,456 in 1918 and $9,701,170 in 1917. After providing for dividends, there was a net deficit of $665,504 on December 31, as compared with a deficit of $1,488,088 the year before; a deficit of $472,377 in 1918 and a surplus of $3,077,018 in 1917. The balance sheet shows that the total profit and loss surplus for 1920, was $14,264,228, as against $14,929,732 in 1919; $16,417,820 in 1918 and $18,890,196 in 1917. The company's assets were given as $32,680,483, as against $33,927,300 in 1919; $36,244,406 in 1918 and $35,969,701 in 1917.

CHINO COPPER COMPANY

Chino Copper Company ended 1920 with net profits of $1,319,541 before dividends, as compared with $1,301,797 in 1919; $3,908,222 in 1918 and $9,512,854 in 1917. After deduction of dividends the surplus for the year was $340,813, as compared with a deficit of $1,308,143 in 1919; $6,688 in 1918 and a surplus of $900,052 in 1917. Total profit and loss surplus at the end of the year was $13,889,908. In 1919 it was $13,549,095; in 1918, $14,857,238 and in 1917, $14,863,926. Assets at the end of the year totaled $25,095,957, as compared with $25,642,264 in 1919; $25,563,209 in 1918 and $24,342,401 in 1917.

D. U. R. EARNINGS—TWO YEARS

Gross earnings from operation	1920	1919
Passenger	$27,794,192	$23,766,561
Express	1,708,766	1,514,238
Mail	14,812	12,959
Special car	59,322	47,311
Total	29,864,227	24,883,077
Operating expenses	15,025,164	13,792,528
Net earnings from operation	2,961,063	4,890,549
Other income	676,117	548,406
Gross less expenses of operation	4,627,181	5,438,915
Interest on funded and floating debt and taxes	2,002,660	2,869,250
Net income before depreciation and contingencies	1,624,575	2,569,665
Less:		
Depreciation reserve	200,000	650,000
Contingent liability reserve	50,000	150,000
Federal tax reserve	150,000	200,000
	400,000	1,000,000
Carried to surplus account	1,223,575	1,618,665
Less dividend	$1,200,000	
Discount	2,385	1,202,385
Excess over all requirements	$ 21,190	or at rate

of $0.21 per share earnings after taking out charges and before dividends. For 1919 the similar figure was $16.78.

President Brooks in his statement to stockholders says in part: "While gross revenues for 1920 were considerably in excess of the revenues for 1919, there was a decrease in net income for the year before providing for depreciation or contingencies, of $935,090.24, as a direct result of increased wage rates and material costs. On June 9, 1920, an increase in fares on the city lines resulted in an increase of two-thirds of a cent in the average fare. This increase failed to offset increase in operating expenses, as provided by the fact that during first six months of 1920 net earnings from operations were approximately $60,000 less than in the corresponding period of 1919, while in the last six months of 1920 the increase amounted to more than $869,000. Increased wages paid motormen and conductors in 1920 amounted to an increase in operating expenses of $2,442,529.18.

UNITED LIGHT & RAILWAYS

Comparative Consolidated Earnings statement for 12 months ended Jan. 31, 1921

	1921	1920	Increase or Decrease
Gross earnings, all sources	$12,634,490	$10,286,470	$1,738,119

The United States Army And Highway Improvement

(*Continued from Page 12*)

measure of choice in subjects as varied as music, stenography, dramatic art, blacksmithing, automotive trades, etc. Among these courses we hope to incorporate some which will fit many of these men to take minor positions with state, county or other organizations which are engaged in developing their highway systems. We hope to have given these men practical couses which will familiarize them with the materials employed, which will fit them to be foremen or to operate any of the machines which are employed in highway building. Others will be given instruction in the management of motor transport, particularly with a view to fitting them to become what for want of a better term we may call fleet managers, men who will be capable of conducting numbers of motor trucks running between different points and transporting goods. To my mind this is one of the problems we now have to face and for which we must find a solution. Nearly two years ago, in writing to a young man asking advice as to the course of study he should follow to fit himself for his life work, I suggested this idea. It seemed to me then, and I think it is more apparent now, that in the future vast quantities of materials will be carried on our highways in these vehicles, and in order that this may be done most efficiently and most economically, it is essential not only that there should be men who know how to conduct them individually, but others who know how to combine them into large or small fleets and to manage such combinations in a way which will prevent delays, which will hasten the journey and which will do this without danger to other users of the road.

The Army's highway transport problem, then, is to be assured that the roads over which it must operate are suitable, that they are sufficient in number, that they are properly located and that the motor vehicles which we can procure will likewise be suited for army use. That this problem is solved aright is of importance not alone to the Army, but to the entire country, and we wish to assure all those who are as concerned as we with the prosperity and with the welfare of our country that the Army will aid in this movement by giving all of the encouragement and help it can afford and by furnishing all of the information it has acquired concerning roads and motor transport.

An address at the recent Highway Educational Conference at the University of Michigan, Ann Arbor.

The Week's Developments In Michigan Legislature

(*Continued from Page 15*)

commission orders, and fixing maximum fares for interurbans at three cents a mile. Warm fights over this and other utilities' bills have been staged in both houses.

The bill of Rep. Edwin B. Ramsey, Lansing, which reapportions the percentage of bond issues which cities of 100,000 population or under may issue for different public utilities, passed the House. It keeps the limit at ten per cent but makes it possible to issue at least eight per cent of this for municipal water works and three per cent for electricity, instead of only two for any utility.

The Senate gave its approval to Gov. Groesbeck's measure creating a department of public safety.

The Legislature is scheduled to end April 29, but Gov. Groesbeck will call the body in special session May 20 to act on the soldiers' bonus proposition.

Rail Rates and Commodity Prices

(Continued from Page 6)

"Conceding that on the surface there is that complexion, and assuming for the purpose of discussion, but not admitting, that these preferences exist, I ask, if this be so, is it wrong? If this be so, why is it so? Congress recognized, as did all thoughtful men, that transportation is the life blood of commerce and industry and vital to the protection of our nation. It must be provided in adequate and reasonable efficient form.

"Continuous and dependable operation of our transportation machine is almost as important as is its existence. The law was formulated in the interest of the country and of the public. The capital invested in, and the men who operate, our transportation machine are employed in serving the public which must and should compensate both.

"If it clearly appears that in order to give the country the quantity, quality and character of service that it needs to which it is entitled, and for which it must pay, some preference, apparent or real, should be afforded to the capital and the men that are employed in that service, I submit that such preference is not undue so long as the public's right to reasonable and nondiscriminatory service and charges is protected. But if that capital and and those men are recognized as having a preferred status because of the public character of the service in which they are employed, those men and those owners of that capital must recognize an obligation to the public which also springs from the character of the service in which they are employed.

"It is no time for stubborn thinking, but it is a time to think of facts, which are said to be stubborn things. The whole country and all of our people, excepting those who are and have been shamelessly profiteering, are suffering the after affects of a titanic war. In some places the agriculturist and the horticulturist are leaving their crops to decay in the fields and on the trees because they can not sell them at prices that more than cover the costs of harvesting and transporting and marketing; and yet the housekeeper purchasing for the home table finds the cost of such commodities close to what it was during the active hostilities.

"In some quarters zealous efforts are made to have it appear that this situation is in large part or in the main due to high freight rates. The freight rates are high. I have yet to meet a well-informed man who does not feel that as a general thing they can be made no higher as a revenue measure.

"Careful inquiry into some distressing situations discloses that the utilization of products is prevented, not by freight rates, but by economic conditions and perhaps manipulated markets.

"In November, 1920, the average ton-mile revenue of the railroads of the United States was 75.7 per cent higher than in 1913. At the same time the wholesale prices of commodities that are transported in large quantities averaged 107 per cent higher than in 1913, and in May, 1920, they were 172 per cent over 1913. Reference has been made to operating costs of the railroads.

"Until the foundation has been laid for widening the margin between the revenue and the cost of earning it, it is difficult to find justification for an attempt at a general reduction in rates.

"I desire to make it clear that although I have referred to some of the troublesome problems, I am still an optimist and not pessimistic on the subject. We all must suffer in varying degrees under the conditions which obtain in the world and affect our country, but we should not lose sight of the fact that those conditions bear upon us with less severity than they do on most peoples; that we have recuperative powers which far exceed those of any other nation, and that with a co-operative spirit along right lines and recognition of the difficulties and the rights of others, and an earnest effort to bring about at the earliest date those conditions which we would like to have obtain, we will soon be looking upon the troubles of the present day as troubles of the past, and will find our country as well as ourselves in a better position, a better condition and a better frame of mind and with more lofty resolves for the future than we had before."

Farm Equipment Manufacture in Michigan

(Continued from Page 12)

as the United States Steel Corporation, the huge motor combines and similar enterprises.

The oldest concern on our list is the Nichols & Shepard Company, Battle Creek, builder of threshing machinery, wind stackers, feeders, steam traction engines and oil-gas tractors. This concern was established in 1848 as a co-partnership and was first incorporated in 1886 as Nichols, Shepard & Company, with these officers: John Nichols, president; David Shepard, vice-president, and Edwin C. Nichols, secretary and treasurer. It was reincorporated in 1887 and the charter has been renewed since that date.

From the start this company has confined its activities largely to the construction of threshing machinery and engines to drive it. The original plant was small, but has been rebuilt and enlarged from time to time. The present capitalization is $1,650,000 in common stock and $550,000 in preferred. Edwin C. Nichols is the president and general manager. The product is sold in small grain growing regions in the United States and Canada.

The Aspinwall Manufacturing Company, Jackson, capitalized at $1,500,000, claims to be the oldest and largest manufacturer of potato machinery. The product includes potato cutters, planters, four-row sprayers, sorters and elevator diggers. The company was incorporated in 1884, at Three Rivers, to manufacture and market the inventions of L. A. Aspinwall, vice-president of the company. The plant was moved to Jackson in 1894. The chief product in the early days was the Aspinwall automatic potato planter. The first year's production was 500 machines in a small shop. The present plant is four times the size of the original one and the annual production about 5,000 machines, which are sold all over the world.

F. C. Mason, George W. Treadwell and T. Bromley, Jr., organized the F. C. Mason Company, St. Johns, Mich., in 1898, to manufacture farm implement supplies, truck frames and radiator guards. The concern was incorporated in 1902 for $20,000 to do a jobbing business in a building having about 800 square feet of floor space. Coil springs and harrow teeth were sold first, but gradually other implement parts were added. The jobbing business developed into manufacturing and the company began to put out cultivator points, singletrees, doubletrees and three-horse bitches. Among its other products the concern is now making points for every known type of cultivator.

Recently the plant space was increased until the present area is 60,000 square feet. Recently the company took over the manufacturing and sales rights of the Angus McCallum improved road plane. The present capitalization of the company is $165,000. Seventy-five per cent of its product is sold in Michigan, the rest all over the country. While the decline in buying has affected the implement manufacturers, those making parts have profited somewhat by this decline, inasmuch as the farmers have repaired old machines rather than buy new ones. On the reorganization of the company in 1920 the following officers were elected: J. T. Milman, president; F. C. Mason, vice president; J. R. Weeks, secretary; W. A. Gay, treasurer.

In the plow manufacturing field the Moore Plow & Implement Company, Greenville, occupies an important position. This company was organized in 1901 to make Moore's patent plow, and the line was developed until production has increased from an annual output value of $65,000 to $225,000, and the manufacturing space from 11,000 to 50,000 square feet. The company bought up the interests of the Gale Manufacturing Company, Albion, and manufactures all the Gale line of machines. Included in the products are riding, walking, orchard, gang and Moore-Gale plows, 50 per cent of which are sold in Michigan and the rest elsewhere.

Donaldson Brothers, Mount Clemens, manufacturers of farm implements and bob sleighs, are a good example of the blacksmith shop development into large-scale manufacturing. William S. and Andrew T. Donaldson organized this business in 1859. They did a general blacksmith business and manufactured wagons and carriages. When the foundry was added in 1875 the partners began to make implements. In 1917 the firm was incorporated. A year later William T. Donaldson died. At present the corporation is capitalized at $100,000, occupies about 35,000 square feet of floor space and its annual product is valued at $200,000.

Plows, harrows, cultivators, scrapers, bean harvesters, agricultural furnaces, caldron kettles, corn shellers, feed cutters, land rollers, farm wagons and bob sleighs are manufactured. Implement and wagon sales are confined mostly to Michigan, but the sleighs are marketed in the Eastern states. During the summer of 1920 the company was running shorthanded because of the labor supply, but during the fall and all winter the plant has been operating on full time with its full force. Donaldson Brothers is one of the oldest, if not the oldest manufacturing establishment in Mount Clemens, widely known as the "Bath City," because of its mineral waters and sanitariums. The company's present officers are: Andrew T. Donaldson, president and manager; Arthur L. Donaldson, secretary and vice-president; Harry S. Donaldson, treasurer.

When the Potato Implement Company, Traverse City, was organized in 1890 to manufacture hand potato planters, corn planters, powder guns, sifters and sprayers, a room 12 by 14 feet was utilized to produce about $4,000 worth of product. The first tool made was a hand potato planter. Today the company is capitalized at $100,000, operates a plant with 60,000 square feet of floor space and turns over about $250,000 of business annually, most of which originates outside of Michigan. Corn and bean planters, dusters and seed sacks have been added to the line of products.

Originally the Kalamazoo Tank & Silo Company, Kalamazoo, manufacturer of elevated tanks, structures, wood and steel tanks, silos,

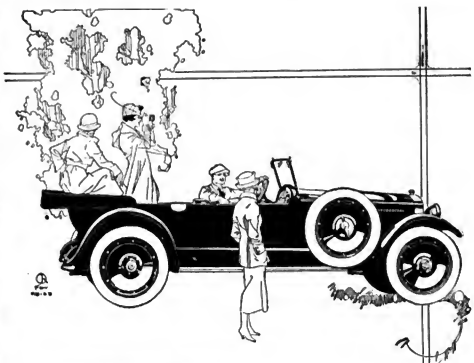
Digitized by Google

windmills and towers, ensilage cutters and other farm equipment, was the Williams Manufacturing Company, organized by H. Manvel and B. S. Williams in 1867. The name was changed in 1900. The product the first year was valued at $25,000 and the manufacturing space did not exceed 1,000 square feet. Subsequent development of the business has resulted in a plant with 200,000 square feet of floor space and annual business approximating $1,000,000. Only 20 per cent of the product is sold in Michigan. M. H. Coombs is president of the company.

Strictly speaking, the actual investment in farm implement manufacture in the state, if we did not include tractors, is approximately $3,000,000. Roughly, another $3,000,000 or more is invested in farm tractor production. Henry Ford & Son, Inc., Dearborn, is capitalized at more than a million dollars, as is the Port Huron Engine & Thresher Company. Other concerns listed as tractor builders are the Acason Farm Tractor Company, Detroit; Wayne Tractor Company, Inc., Eaton Machine Works, Jackson; Leonard Tractor Company, Detroit.

A review of the opinions of implement manufacturers throughout the state seems to point to great expectations for a renewal of business in the fall. Nothing much is expected this summer. This industry has been hit as hard as any other, but its recovery with a gradually growing increase in demand is only a question of months.

The writer admits that in this sketch of a few concerns he has scratched only the surface, necessarily because of the dearth of material available. The following list of companies listed as implement manufacturers shows the present manufacturing and buying power of this industry in Michigan. The figures after each name indicate the approximate capitalization which in most cases is more than the amount given:



J. M. Montigel, Alma, $10,000; Ann Arbor Machine Company, Ann Arbor, feed presses, hay cutters, etc., $100,000; William Rapson & Sons, pea harvesters, Battle Creek, $5,000; Nichols & Shepard Company, Battle Creek, $1,000,000; Bay City Plow Company, Bay City, beet lifters, $100,000; George Fair & Sons, Blaine, implement foundry, $5,000; Sheffield Manufacturing Company, Barr Oak, cultivators and planters, $50,000; Campbell, Mason & Sons Company, Detroit, $300,000; Dowagiac Drill Company, Dowagiac, broadcast grain seeders, $100,000; Hiram R. Streeter, Grand Ledge, corn shellers, $2,500; Greenville Implement Company, Greenville, $50,000; Moore Plow & Implement Company, Greenville, $50,000; Patterson Manufacturing Co., Holly, seeders, harrowers, etc., $50,000; Seeder Manufacturing Company, Homer, cultivators and harvesters, $2,500.

G. W. Arnold's Sons, Ionia, wheelbarrows and grain seeders, $5,000; Aspinwall Manufacturing Company, Jackson, bean cultivators, plows, etc., $300,000; Frank Hutchison, Jackson, potato planters, diggers, etc., $25,000; Watts Manufacturing Company, Jackson, corn shellers, investment not known; Kalamazoo Tank & Silo Company, Kalamazoo, corn shellers, etc., $300,000; William McDonald's Sons, Lapeer, $2,500; Donaldson Brothers, Mount Clemens, $100,000; Bacon Manufacturing Company, Pontiac, hand drills, cultivators, etc., $10,000.

Park Plow Company, Richmond, walking plows, bean harvesters, bob sleds, etc., $10,000; J. L. Ortner, Richville, $50,000; A. T. Ferrell Company, Saginaw, fanning mills, etc., $500,000; F. C. Mason & Company, St. Johns, cultivators, etc., $50,000; Potato Implement Company, Traverse City, corn and potato planters, $25,000; O. E. Thompson & Sons, Ypsilanti, grass wheel barrow seeders, $25,000.

HULL MACHINE ADDS TO FORCE

The Hull Machine Works, Lansing, has installed a complete welding outfit and new employes are being added to care for the increasing production.

Surprising Power

Power—that's what you need for hills and speed, for bad roads, quick getaway and all-day going—power that does all its work without noticeable engine effort. And that's precisely what you get in the newest Winton Six. It's an amazing car. May we show you? Simply telephone.

Yankee Business in Wooden Shoes

(Continued from Page 7)

Dutch industry has agitated for a revision upward, but it is unlikely that the five per cent duty will be disturbed, although it is believed there will be some changes in policy.

Amsterdam's diamond-cutting industry has suffered some from the establishment of works in South Africa. Because of the high grade work done by Dutch cutters, there is a question as to how far the South African enterprises will affect this industry. Holland is going in strong for wireless equipment and is now building stations for wireless communication with the East and West Indies and America. Dutch inventors have perfected a waterproof, floating safe for the preservation of valuable papers in ocean transportation between Holland and her colonies. The merchant marine has now 500 ships and the herring fleet consists of 750 boats of all types.

Trading with the Netherlands, as said, includes the Dutch East and West Indies. The East Indies' population is 48,000,000, and in 1919 the value of foreign commerce was $867,000,000, of which $296,000,000 represents imports and $571,000,000 exports. The United States sold hardware, iron and steel sheets, tin plate, railroad material, pipe and fittings, galvanized sheets, wire, milk products, naval stores, automobiles, trucks, tires, house and office equipment. The imports from the United States were valued at $7,000,000 in 1918, but jumped to $45,500,000 in 1919, and for the first eleven months of 1920 were $51,500,000. During 1920 the exports to the United States from the East Indies were valued at $144,600,000. The vegetable oil industry both in the Netherlands and the Indies, although established only for years ago, has developed so rapidly that plants are being constructed for a future output of 400,000 tons of crude oil before the end of the present year. Of this amount 125,000 tons will be for home use and the remainder for export. This oil industry represents a consistent and increasing demand for machinery.

Labor saving devices are being given considerable attention owing to the increasing costs of labor, which affords considerable food for thought among the machinery manufacturers of this and other countries. So far tractors have not been successfully used in cultivating the rice and harvesting, for the reason that the clay of Java and other islands making up the Dutch Indies is so heavy and sticky. However, there is a great market for metal products, machinery and repair parts and tools. The Dutch East Indies had in February a favorable balance with the United States of about $8,500,000, against $33,300,000. The total population of the realm of the Netherlands is 54,850,000, or about half of that of the United States.

Reports for March indicate a resumption of business in the cotton and piece goods lines by May 1, and merchants are already ordering from the mills in preparation for the Poesa Month (July), which is the Mohammedan New Year. At this time of the year the natives spend about forty days in idleness and fasting. A large percentage of the year's cotton goods sales are made at this time, and it is not unusual for importers to have commitments as high as $10,000,000.

Dutch commercial interests are represented in this country by the New York Chamber of Commerce for the Netherlands and Netherlands East and West Indies, 44 Beaver street, New York. Dr. D. H. Andreae is the commercial attaché at the Royal Netherlands legation, Washington, and William G. Bryant, of Clark, Emmons, Bryant, Klein & Brown, Detroit, is trade advisor for the Netherlands in this district.

World Conditions and Michigan Business

IN THIS NEW AGE of world-wide industrial and commercial development which has grown up in the last sixty or seventy years, the utilization of mechanical invention, manufacturing processes, means of transportation of material and means of communication have made the whole world an industrial unit; and for me to lay any foundation whatever for a survey of business conditions at Ishpeming, Mich., I must speak in terms of Europe and Asia and Australia, Canada and Mexico, as well as Boston, Pa., San Antonio, Texas, and Cleveland, Ohio. For you to solve the problem as to purchasing a suit of clothes or deferring that purchase, and for your tailor to solve the problem of purchasing his worsted and his findings, for the dry goods merchant to decide upon his requirements for gingham and muslin, for the mining corporation to develop its plant for the coming year, ending, none of us are very much concerned about Marinette or Ishpeming or even Milwaukee or Chicago. What we must know is something of world economics.

I will not take the time even briefly to review the world causes which have brought about the present general stagnation in business, the unprecedented and unparalleled cessation in buying, but I wish to point to some of the developments of the world reaction that indicate the gravity of the situation. Even at the peak of high prices last year there never was a time, taking the world as a whole, that there was a real shortage in the material necessities of life, and just as soon as the world's ships were withdrawn from military service and made available for the transportation of merchandise, these great stores of commodities that had been held up for lack of ships began to pour into the United States of America because we are the richest market of all the nations in the world today. Millions of bales of cotton from India came here and millions of bales of our own cotton piled up in the warehouses of the South. The wool and mutton surplus of Australia came here, the vegetable oils of China and Japan, and the dressed beef

By R. B. GOODMAN

Chairman, Bureau of Economics, National Lumbermen's Association

An address delivered April 5 before the Ishpeming, Mich., Industrial Association. Mr. Goodman is president of the Goodman Lumber Company, Marinette, Wis.

of Argentine congested our ports, and almost overnight a seeming scarcity with famine prices changed into a surplus for which there is comparatively no demand. We have, I am told, nearly a year's supply of raw cotton; we have two years' supply of mutton; we have three years' supply of wool, and between two and three years' supply of hides. With this change in the visible supply of most of the necessities of life also came a restriction of credit or a deflation in price which the Chamber of Commerce of Kansas City has upon thorough investigation announced as a loss in nominal value of wealth in this country of more than $25,000,000,000, approximately equal to the entire cost of our participation in the world war.

Prices on Decline, But—

Perhaps the most concrete picture of the shift in prosperity is the change that has taken place during the last few years in the cost of living. The National Industrial Conference Board has developed a very thorough, complete and scientific bureau of statistics, and this bureau has revised the data on this subject in so scientific a manner that it is now accepted even by the Government as superior to the compilations of the Bureau of Labor. In the family budget it was found that, taking a wide field of survey, to the average family of the average wage-earner foodstuffs represented 43.1 per cent of the family budget; shelter, 17.7; clothing, 13.2; fuel and light, 5.8 per cent; miscellaneous items, such as medical attendance, amusement, travel, gasoline and an occasional Ford car, 20.2 per cent. By plotting the curve of these various groups of commodities based upon their retail prices and then weighting the average according to these percentages, it was found that, taking the average cost of living for July, 1914, as a base, in June, 1918, the cost of living had increased 52 per cent; March, 1919, 60 per cent; November, 1919, 82 per cent; July, 1920, 104 per cent, and that was the maximum. Then the wage-earner's dollar bought less than half of what it would have bought in July, 1914, and since July, 1920, the cost of the family budget has steadily declined, till in March of this year it has gone down from 104 per cent above the 1914 base to 70 per cent above that base. The Bureau which has compiled this data advances the further opinion that the cost of living is still bound for a further decline during the remainder of this year to about 50 per cent of the 1914 base, or about on the same basis as the medium of the year 1918; so that the wage-earner's dollar has increased in value since July, 1926, from less than 50 cents to nearly 66 cents, which is an increase of more than 20 per cent in the dollar's purchasing power in this period, and the indications are that the purchasing power of the wage-earner's dollar will continue to increase, which is only another way of saying that prices are still on the decline.

There would be no very great hardship or particular difficulty about this situation if the decline in prices were uniform and if the reduction in nominal wages were such as approximately to maintain the same actual wage for the wage-earners, but this is not the case. Some commodities have, by force of circumstances, been forced to take a disproportionate decline, while others have through equally unfortunate circumstances been enabled temporarily to delay the taking of their proportional reduction in price. This is unfortunate, for example, for the apple growers in the state of New York, where the retail market price of apples has declined and the cost of transportation and the cost of the package has not declined. I am told that the barrel and the freight to the market leaves nothing to the apple grower for his apple. This same situation in fabricating industries is what shuts down the factories and throws men out of em-

Digitized by Google

ployment; and let me say right here that that is the gravest feature of the present situation. I have no sympathy for the working men who complain of a reduction in wages, when those reduced wages will buy them practically as much today as a high wage would a year ago; but the hardship falls upon the wage-earner who wants to work and is unable to obtain steady employment. And the fault is not with his employer, who also wants steady employment and continuous operation. The fault is with the artificial restriction that our laws have placed upon industry which make it illegal for the manufacturers of lumber, or the manufacturers of iron and steel, or the manufacturers of automobiles or any other product to get together and agree amongst themselves to regulate their production in accordance with the demand. If this could be done fairly and honestly and without abuse, the public would not be the loser as a buyer and consumer and the public as a wage-earner would be benefited by more stable and more permanent employment.

You will doubtless be surprised, as I was surprised at seeing a digest of the 1914 census of manufacturers of the United States, which showed that this country is pre-eminently a country of small units of industry. There are only 2 per cent of the employers, either individuals, partnerships or corporations, in this country, that employ a thousand or more men. There are 98 per cent that employ less than a thousand, 91 per cent that employ less than one hundred men, 70 per cent employ less than 20 men. In every other country in the world these employers of labor and producers of goods may get together and agree amongst themselves how to regulate their production so as to stabilize their employment of labor.

I do not wish to inject any politics into this discussion, but you know as well as I do, whether you are a Republican or a Democrat, that we have for reasons that may have been fully justified passed through eight years of governmental interference with business. In this, England is in a worse condition than ourselves. Most of you have followed with interest the world career of Lloyd George. You know that fifteen years ago he might be called, if not a socialist at least a semi-socialist; that he was one of the hopes of the Socialist party. You know the socialistic measures that he has developed in England. You know how well cured he is of these doctrines today. In a recent statement with which you probably are familiar he stated that if the labor organization of England had 4 per cent greater strength in the recent election they would have been able to control the destiny of the British Empire. You know that England's economic weakness today is due to the tax burden which is double and treble our own for the maintenance of old age pensions, unemployment gratuities and the other burdens of its socialistic program. The best authorities on economics in this country who recently have visited Europe report that Germany with her indemnity burden is a stronger commercial competitor than England or France.

So, taking the world situation by and large, you will see that we not only have to deal with a serious commercial and industrial depression in this country, but that every other nation on the globe, from Japan to China, to India, to Russia, to Germany, to France, to England, is in the same or still more desperate situation with ourselves. You and I are often asked, "What is there encouraging in the outlook?" I claim there is no optimism permissible to any man who has not first grasped the seriousness of this situation. When we have done that, there is much for encouragement. Today we see those commodities which have held out against readjusting prices falling into line—you merchants can speak more by the book on this than I. It is firmly believed by men whose

NEW MICHIGAN CORPORATIONS

FOR WEEK ENDED APRIL 16, 1921

Wolverine State Automobile Assn., Kalamazoo; mutual benefit to all its members and others; Henry L. Toren, Grand Rapids; R. Frank Taylor, Rockford; Mrs. A. M. Renelle, Allegan .....

On the Square Tire Co., Detroit; to engage in retail and wholesale tire and automobile accessory business; Max Kuhnreich, 82 Forest Ave, E.; Henry Kuhnreich; Isadore Bradfield, Detroit .....

Equitable Auto Service Corp., Detroit; to buy, sell, repair, rent and store automobiles and all other kinds of automotive vehicles; G. Anthony Weisenhagen, 284 Nevada Ave.; Edgar A. Clink, Detroit; Charles F. Holderman, Clawson .....

Michigan Iron & Land Co., operations in counties of Marquette, Baraga and Houghton, Iona and Dickinson; office at Sault Ste. Marie; purchasing, owning, holding and improving of timber lands and other real estate; Robert P. Hudson, Sault Ste. Marie; George A. Osborn, Fresno, Cal.; Walter C. Wylie, Sault Ste. Marie .....

Carson City Elevator Co., Carson City; to engage in and carry on a general elevator business. Bernard Miller, Hubbardston; William Hausman, Nevile Davarn, Pewamo .....

Grand Rapids Acme Truck Co., Grand Rapids; to buy, sell, deal in motor trucks, automobiles and motor truck parts and accessories; Jacob Widdicomb, Thomas G. Wanty, G. B. Watson, Grand Rapids .....

Scotland Realty Co., Detroit; real estate; Saul and Harry Feinberg, Cleveland, and Emanuel Goldberg, 3925 East Grand Blvd., Detroit .....

Western Tyre Co., Detroit; to manufacture, buy, sell and deal in toys and novelties of all kinds; W. Fairbairn, Astor Court W. Grand Blvd.; M. L. Bryce, 2229 W. Grand Blvd.; A. L. Lott, Detroit .....

Midway Furniture Co., Detroit; to manufacture, buying, selling and dealing in all kinds of furniture, carpets, rugs and household goods; William F. Carroll, 4343 Allendale; Edward J. Sullivan, R. D. Peterson, Detroit .....

Peoples Sales & Service Corp., Detroit; to act as manufacturers' agents and to sell supplies; D. H. Peoples, 139 Phillip Ave.; H. F. Dervey, F. D. Peoples, Detroit .....

Downtown Auction House, Detroit; to conduct and operate an auction warehouse and deal in general merchandise; Chas. H. Roberts, 1 Grande Ave. 125 Eason Ave., Highland Park; Gustave Otto, Detroit .....

Muenz Shoe Shop, Detroit; to retail boots, shoes, slippers, laces, polishes, etc.; Edith Muenz, 7351 Victoria Ave.; William F. Muenz, Frank J. Quickert, Detroit .....

Kay-Bee Electric Co., Detroit; to buy and sell electric fixtures, wiring devices and supplies, and install same; Herbert H. Warner, 5001 Brush St.; Samuel Dulaney, Detroit; Ralph W. Emerson, Highland Park .....

Clinton Creamery Co., Elsie; to manufacture, buy, sell and deal in dairy products, including milk, butter, cheese, etc.; H. M. Wooley, John Schofield, Elsie; Edwin Hall, St. Johns, R. F. D. .....

Fox Realty Co., Jackson; owning of buildings to be occupied for dwelling houses, halls or business purposes; William R. Hiram W. Fox, Jackson .....

Vandercook Coal & Wood Co., Detroit; to engage in general coal and wood business; buy and sell wholesale and retail coal, wood and fuel; Charles H. Franklin, George W. Daniels, George A. Vandercook, Jackson .....

Herrick-Chadwick Co., Highland Park; to purchase, hold and deal in real estate; James G. Pierce, Highland Park; Robert O. Herrick, John A. Chadwick, Royal Oak .....

C. H. Clark Oil Co. (P.), Cleveland, O.; J. J. Shapiro, 1656 Virginia Park, Detroit, Michigan agent .....

Lauchlin Farm Gate Hinge Co., Jackson; manufacture and sale of the Lauchlin farm gate hinges; Henry Lauchlin, Lansing; Albert S. Pher, H. A. Kinch, Jackson .....

Universal Lightning Rod Co., Owosso; sale of lightning rods; J. B. and F. A. Lewis, Owosso .....

Garber Machine Co., Inc., Bay City; sale as wholesaler, retailer and jobber and manufacturer's agent of marine engines, parts, accessories; Mary F. and Walter S. Cooley, Bay City. W. Fred Garber, Essexville .....

Detroit Rapid Transit Co., Detroit; to own and operate system of motor transportation; George E. and Guy Nester, 805 Badenacher Ave.; J. M. Reay, Detroit .....

Michigan Chair Co., Grand Rapids; to manufacture chairs and other furniture; Thomas A. Scott, Jr., Grant Garratt, John D. Karel, Grand Rapids.

Royal Eight Corp., operations in county of Oakland, office in Detroit; real estate; Albert E. and Elsie K. Meinke, 71 Philadelphia Blvd, Detroit .....

Sebastian Investment Co., Detroit; real estate; Sebastian S. Kresge, 70 W. Boston Blvd.; R. H. Servis, A. E. Lauffer, Detroit .....

Klinger Lake Light & Power Co., Sturgis; to distribute electric current for light and power to those having summer cottages on Klinger Lake; W. A. Cavin, C. W. Kirsch, Sturgis; John A. Howard, Kalamazoo .....

News-Record Printing Co., Ironwood; printing, publishing, book-making, binding, etc.; Frank E. Noyes, Howard A. Quirt, Linwood Noyes, Ironwood .....

Kridler, Welden & Broadway Co., Grand Rapids; buying and selling automobiles and parts, also accessories; service station; renting cars; Guy M. Kridler, John S. Welden, William Broadway, Grand Rapids .....

Auto Transportation & Finance Co., Detroit; to organize and control an automobile system for the carriage of passengers for hire in Detroit; George J. Russell, Arthur Schlatter, 2711 Wrefford Place; Charles H. Buell, Highland Park .....

Motive Industrials Corp. (P.), Wilmington, Del.; George W. Moore, Campau Bldg., Detroit, Michigan agent .....

Detroit Packing Co. (F.), Wilmington, Del.; Joseph Garduski, 901 Russell St., Detroit, Michigan agent; 50,000 shares, no par value.

Crown Die Casting Co., Detroit; to manufacture, buy and sell bearings and die castings; R. Frank Ward, Mt. Morris; John F. Goude, Venancius E. Zimmerman, Detroit 25,000

Prather Wheel Mfg. Co., Detroit; to manufacture and sell within United States the Prather auto wheel, etc.; Frank M. Prather, 427 Temple Ave.; Frank Stack, Detroit .....

Brown-Mill Tire Service Co., Detroit; to manufacture, buy, sell and deal in automobile accessories and supplies; Harry W. Miller, William W. Brown, 366 Philip St.; Edward C. Mitchell, Detroit .....

Bay City Optical Co., Bay City; manufacture and sale of optical merchandise, a prescription house; Max McKay, Bay City; P. H. McKay, W. A. Sanborn, Detroit .....

C. F. Redmond & Co., Inc. (F.), Boston, Mass.; W. A. Dixon, 16-17 Congress Bldg., Detroit, Michigan agent

Detroit Re-Tinning & Repair Co., Detroit; repair and re-tinning of cans, etc.; Frank Vismara, 2981 Baldwin Ave.; Emil Hallberg, Lawrence Pastorium, Detroit .....

Thumb Oil & Gas Corp., Port Huron; wholesale and retail of gasoline, kerosene, oils, etc., grease, tires and accessories; Archie McGillivray, Bert Bowman, trustee, Bad Axe .....

Sanitary Baking Co., Detroit; operating bakery stores in Detroit and other cities in Michigan; Donald Woodruff, 1523 Lime Kiln Road; Caroline M. Hay, Ivan C. Hay, Detroit .....

CHANGES OF NAME

Brown-Furnell Co. (name changed to Cornelius Brown Co.), Detroit ..... $

Case Press (name changed to The Pemberton Press), Detroit .....

Marshall Corset Co. (name changed to Cornet Corset Co., Inc., and station located at Jackson and Marshall), capital increased from $50,000 to.....

It Is Reported W. E. Flanders Will Join Durant

(*Continued from Page 6*)

1,000 years, after which he with William E. Metzger and B. F. Everett started the Everett-Metzger-Flanders Company. This was in 1907. Three years later the concern sold out to the Studebaker interests and later the former E-M-F as the Everett-Metzger-Flanders Company was better known, became the present Studebaker Corporation as far as the automobile business of the latter is concerned. Flanders remained with the Studebaker interests for a short time as vice-president and general manager, but when the Saxon Motor Car Company was organized by his former associate, he left the Studebaker and joined Metzger.

Durant Motors plans the establishment of three big factories—one on the Atlantic coast, one on the Pacific coast and the third at Flint. The motor, specially developed, is being brought out at several factories. The first model was not satisfactory to Mr. Durant, and the present one, which was produced at the factory of the Continental Motors Corporation, is being tested out by Clifford Durant, son of W. C. Durant, and until recently manager of General Motors on the Pacific Coast.

The Durant corporation has appointed the George P. McMahon Company, 52 Penobscot building, as its official representative in Detroit and vicinity. The Durant Motors, Inc., securities will be offered to the public on the partial payment plan, with a view to reaching the small investor.

More Light on the Automotive Price Situation

By MARC BRAUN

SEVERAL more letters on the subject of present motor vehicle prices have been received from manufacturers and dealers and are published herewith as a continuation of the article which appeared in this publication last week.

The announcement made by the United States Steel Corporation of material reductions in prices has been taken in some quarters as a forerunner of price cuts by the automotive manufacturers, but from confidential statements made by several officials of motor car and parts concerns, it is not expected that any of the more important producers will reduce prices either at present or during the next few months, for the reason that the steel corporation's cut is not retroactive—does not apply to steel already ordered, but became effective only on the day of the announcement.

"It would be impossible for us to reduce prices on the present output but it will be possible to take into account the lower steel costs when arranging for our 1922 series," said the vice-president of a concern making a car costing between $3,000 and $5,000. He added: "It is absurd to think that price reductions can be made overnight, or in a few days. The announced reductions in quotations by the U. S. Steel Corporation will have to be analyzed. Furthermore, inasmuch as we have not planned a reduction in the prices of our cars, we would have to take the matter up with our distributors. The agent or dealer cannot be ignored, and more so when the present general conditions. And even if after the proposition had been fully investigated it were decided to reduce prices, this could not be done until the end of the present selling season, which means end of July."

One of the foremost automobile parts makers, who uses large quantities of steels, made the following comment: "There are too many people who take the word steel merely in its broad meaning when applied to the automobile. They seem to have no idea that steel in a motor car means varieties or composites of steel, more than just plain steel. Some people figure that the big item of steel cost in an automobile is the frame. They do not taken into account axles, transmission, the engine and a number of other components in which steel and steel by-products enter to a great extent. When it comes to figuring costs, all these items have to be taken separately, and the prices vary a great deal. I have no doubt that the reduction in steel prices will gradually effect the automotive industry, but I am very much in doubt that the manufacturers can afford present list prices before the present production schedule, or the 1921 output, has been completed. I know for instance that we could not allow our customers a reduction on the orders which they are having filled now or which they placed with us yesterday, unless these orders were filled with materials purchased at the new reduced prices."

Frederick J. Haynes, president of Dodge Brothers, is quoted as follows: "I do not think the reduction in steel prices will have any immediate effect on automobile prices. Stocks purchased at the higher levels are still unconsumed. We are in the same case as the grocer who has loaded up on sugar at 10 cents a pound. You would not expect him to be a heavy purchaser now when sugar has dropped about 50 per cent. We must first use up the steel we have on hand and then we shall be in the market again.

"Business generally is not yet normal. It would seem as if the steel men had picked out strategic points where they are advertising reductions. These are in lines where the stocks on hand have run low. They will start their mills and then by the end of the year the rest of us will be in the market and the steel industry will proceed at a normal pace."

President Alvan Macauley, of the Packard Motor Car Company, is quoted as follows: "I cannot see how steel reductions can have any effect on automobile prices. Steel is not the most costly part of the automobile. Aluminum, leather and labor all play a far larger part in figuring costs. The percentage of economy effected by even a large reduction in steel prices is so small as not to be appreciable in the final total."

A Letter From Mr. Jandron

F. L. Jandron, treasurer and assistant general manager, Packard Motor Car Company, Detroit, writes: "A great deal of uncertainty prevailed last fall as to the probable extent of the price decline then in progress and its effect on manufacturing costs generally. In view of the firmness in iron and steel quotations, many automobile manufacturers could then see nothing ahead which would justify lower prices. At the same time, they naturally were anxious to maintain or strengthen their competitive position by price reductions as soon as those should be possible—even at the sacrifice of profit.

"While anxions to avoid panicky or precipitate action, the dominant tendency was to relieve public apprehension by guaranteeing that any price reduction during the winter and spring of 1920-1921 would be made good to those who bought vehicles earlier in the season.

"Now that a clearer view of the situation can be had, it is evident that for the time being at any rate wholesale prices have stabilized themselves.

"The great revival of automobile buying since February 15 indicates that confidence has been in large measure restored, and, until further and radical deflation of basic material costs and wages occurs, no reduction in retail prices of standard established makes of automobiles need be looked for.

"The diminished rate of production during the last six or seven months has enabled manufacturers and distributors to liquidate old inventory and replace it largely with stock purchased at the new prices; but increased charges incident to the readjustment make even present car and truck prices possible only if the retail demand continues to improve."

C. J. Helm, secretary of the Acme Motor Truck Company, Cadillac, Mich., writes: "The writer is inclined to comment only on the motor truck situation, and this as it affects our own company.

"We have made no reduction in prices as yet and do not anticipate a reduction before at least July 1. At present there are no indications that costs will be reduced to justify a reduction in price of our line during the summer months.

"During the war period Acme prices were increased only when absolutely necessary then only in such amounts as were actually required to take care of increasing costs. Our product has not been increased to exceed 50 per cent during the entire war period. Naturally, the lower the increase, the lower the decrease, and the slower it will be in working out.

"As near as we have been able to check up the truck companies which cut prices last fall, they did not materially better their sales for a month or two, and in one or two instances prices have since been increased practically to offset the decrease."

R. H. Collins, president and general manager of the Cadillac Motor Car Company, Detroit, writes: "Present prices on Cadillac motor cars will remain unchanged throughout the year 1921.

"Year after year it has been necessary for us, at this season, to caution prospective buyers of the Cadillac motor car against possible disappointment in the matter of securing delivery. The necessity was never more urgent, as it is our conviction that the months of May and June, and the remainder of the year, will witness the greatest shortage of Cadillac cars in the history of the company."

C. C. Starkweather, president, Starkweather-Buick Company, Detroit, distributor for the Buick cars, has written as follows: "Answering your three questions, I desire to say: First, price reduction is neither warranted nor necessary to stimulate sales; second, the general outlook for business this summer is very good; third, our sales in March are equal to those in the same month in 1919 and double those for April, 1920, and 300 per cent better than January and February, 1920.

"We sold 78 Buicks during the period in automobile show. We believe that business is much as you make it and we have made it good and intend to keep it good. But, this is possible only by the best of salesmanship, which our staff continues to display."

World Economic Conditions And Business in Michigan

(*Continued from Page* 41)

Judgment must be respected that the corporation steel prices will soon take their cut. What is true of commodities is true of labor. One after another of the strongholds of highly organized trades have seen the light of wisdom and accepted both a reduction in the wage per hour and what is of more economic importance, the necessity of performing a fair day's work. Already in those communities where building materials of all kinds have taken their reduction in price and where the building trades have taken their reduction, in such communities business conditions are good. A further hopeful sign for the immediate and intimate future is the return of those in high places in our Government to a better understanding of the framers of our constitution. I wish to close by quoting a paragraph from the report of the Calder Senate committee on the housing situation which was largely penned by Thomas Jefferson or Alexander Hamilton. If you will take this one thought of this one paragraph home with you and think about it, I shall have done more than repaid. The final conclusion or recommendation of this committee with respect to legislation begins as follows:

"The committee believes that, following the American custom, private enterprise must be depended upon to meet the crisis which has been outlined in this report. The Government is an organization to govern, not to build houses or operate mines or run railroads or banks. It is a Government for the general welfare of the people, however; and it should use its governmental power to aid and encourage private enterprise."

MORTON SALT TO INCREASE OUTPUT

Four new vacuum drying pans are about ready for use at the Morton Salt Company plant, at Marysville, which will increase production to 3,000 barrels a day. The pans were installed to replace four older ones which are receiving an overhauling.

The plant now has twenty boilers in operation and two new 500 horsepower boilers recently were installed. The boilers consume 300 tons of coal daily, which is shipped to Marysville by boat from the coal fields in Ohio. The first boat load arrived last week.

New Cylinder Reboring Tool Brought Out in Detroit

To overcome certain of the difficulties heretofore encountered in cylinder reboring tools, the Van Dresser cylinder reboring tool has been brought out by the international Purchasing & Engineering Company, Detroit. This has been accomplished by various improvements which, the sponsors say, have produced simplicity of design, accuracy and ease in operating, freedom from wear, and light weight. Points of particular interest are the following, according to a bulletin just issued by the company:

The feed bar is of large diameter, hardened and ground, which results in the wear on this part being practically eliminated. The feed bar has no threads but a small rack which gives it practically a 100 per cent bearing surface. This arrangement also makes it unnecessary to turn the bar in order to remove or back up the feed bar. The mechanism on the rack cut-in-bar can be simply released and the feed bar pulled straight out or dropped through the bottom of the cylinder, whichever is convenient. The feed machine can thus be disconnected when used in operation on a drill press, and gives the operator the option of using either the feed on the drill press, or the feed provided in the tool.

A floating driving socket is provided when this tool is used in connection with the drill press. This eliminates tendency to inaccuracy due to misalignment of the cylinder reboring tool with the drill press.

The bearings are long and solidly constructed, with a total bearing length of 9¼ inches. The lower bearing is very close to the cylinder bore. This insures rigidity in operating when the reamer is at the bottom of the cylinder bore. The reamer blades are made of high speed steel. The reamer head has a long hardened and ground taper shank which is drawn into the feed bar by a floating draw-in screw (same as an arbor in a mill machine or lathe center in a lathe.) This insures, it is asserted, absolute centering of these units when assembled.

The large hardened and ground adjusting pin is provided with two bearings to insure true alignment, rigidity and long wear. The reamer head does not have to be removed from the feed bar in order to adjust the reamer blades.

Probably the most interesting feature is that the tool is so designed as to eliminate guide rings. It is also equipped with heat treated alloy steel gears.

The reboring tool can be instantly removed without disturbing the base, which has been centered separately over the cylinder bore. This allows the operator to try the fit of piston before boring all the way through, and if another adjustment of the reamer blades be necessary, the boring tool when reinserted will automatically be central with the unfinished bore. This prevents a possibility of the new boring being eccentric with the work already done. Electric attachment is also provided.

KELLOG A TRADE ADVISER

It is announced that Mark Kellog, export advertising manager of the Burroughs Adding Machine Company, Detroit, has been appointed a member of the Foreign Trade Advisory Service Staff of the National Foreign Trade Council's annual convention, in Cleveland, May 4 to 7.

BEAVERTON WANTS FORD BRANCH

It is reported from Beaverton that the municipal officials have written to Henry Ford, asking him to consider the community as an advantageous location for a factory, due to the fact that there is plenty of water power. The villagers would like to get a Ford tractor plant.

This little lever moved by the thumb selects the speeds.

A Clean Floor Board

The appearance of any car is enhanced by taking out all the trappings sticking out of the floor board. In closed cars this appearance is a decided advantage.

In an open car where a lap robe may be used, there is a further advantage of getting rid of the "Wobblestick" hand gear shift lever and the emergency brake lever.

This can be done by removing the hand gear shift lever and placing the emergency lever to the left of the steering wheel. The C-H Magnetic Gear Shifts eliminates the hand lever.

The clear floor board, free from levers and other trappings, is well worth considering when designing or purchasing a car.

OIL DRILLING IN LENAWEE

Oil drilling in Lenawee county is progressing. The Adrian Telegram says that work has been resumed on the oil well on the James Wheaton farm, a depth of 1,000 feet having been reached. At the well being drilled on the Ray Fatchett farm, in Riga township, a depth of 625 feet has been reached. The W. K. Development Company, drilling on the Guy Weisinger farm, has reached a depth of 1,600 feet.

Machinery and Power Equipment

Our Aim is to Render Service

COMPLETE EQUIPMENT

FOR

Tool Room, Production Shops, Sheet Metal Shops, Pattern Shops, Body Plants, Automobile Plants, Wood-working Plants, Repair Shops, Heat Treating Iron and Metal Foundries.

For electrical equipment industry we always have in stock among the 1,000 or more machine tools the following very desirable Michigan latest type, highly improved re-designed Punch Presses: Better get a detailed copy of our latest stock list.

SIZES No. 1, No. 2, No. 3, No. 4, No. 5, O. B. I.

Two only, 22 Consolidated Horning Presses, like new.
One only, No. 4 Niagara O. B. I. Press; used.
One only, National Premier Motor-Driven Screw Cutting Bench Lathe; something entirely new.
Motor-Driven Bench Drills.
Motor-Driven Bench and Floor Type Ball Bearing Grinders; and many more too numerous to mention.

We buy, trade, sell or exchange only High Grade Equipment.
We have the proper facilities to serve you right—THEREFORE trade with us and save money.

Aladdin

Aladdin Solves Industrial Housing Problems

Firms confronted by problems of Industrial Housing can find a valuable precedent in the experience of many firms who have housed their employes in Aladdin houses. An employe in a good home is a satisfied employe and an asset to your business. Good houses for workmen are not charity nor philanthropy, but a plain case of good business.

Housing Your Men Well and Quickly at Lowest Costs.

The Aladdin system of construction saves 18 per cent of the lumber wasted in ordinary building. Standardization and quantity production further reduce the building cost approximately 30% to you. Also you benefit by Aladdin's stupendous purchasing power. Aladdin houses are easily and quickly erected by unskilled labor. Simple, complete instructions are furnished with each house.

The Aladdin System and Plan.

Aladdin houses are Readi-cut. Every piece of joists, studs, rafters, sheating, siding, flooring, interior finish is cut to proper size, marked and numbered ready to nail in place. Sufficient material to complete more than 3,000 houses is carried constantly in stock ready for instant shipment. Depending upon size of house, we load from one to three complete houses in each car.

Quicker Delivery From Our Four Mills.

Aladdin houses are manufactured and shipped direct from the Aladdin Company's own mills in Michigan, North Carolina, Oregon, Mississippi, and Canada. Aladdin houses come to you in a straight line from the nearest timber region. Aladdin's Industrial Housebuilding Service means shorter routes, quicker delivery and lower freight rates for builders in every part of the United States. Three days to a week are saved in shipments reaching destination. Complete sales and business offices are maintained in connection with each mill. Fully 24 hours' time is saved in your mail reaching our offices.

Single House or Complete Cities.

We will quote you a definite price on a single house or complete cities of 300, 500, 600, 1,500 and 3,000 population. These cities include homes, stores, churches, schools, offices, etc. Several cities are now graphically presented in our book, "Industrial housing." Write for book No. 2081.

Preparing for Death and Taxes

Too Few Successful Business Men Today Understand How Much Their Estates Must Pay; Insurance a Factor

By FRANK M. HAYES

Frank M. Hayes, author of this article, has given practically all his time to the study of life insurance as applied to business, especially inheritance tax insurance, guaranteed life incomes, business life insurance and profit sharing counsel. He has familiarized himself with the inheritance tax laws of all the states having such laws and with the details of the federal estate tax law. Taxation, as is well known, is one of the major problems of the day, and inheritance taxation is one of the least understand by the average man. Mr. Hayes is connected with the Phoenix Mutual Life Insurance Company, Detroit office.

I HAVE OFTEN wondered why a successful man keeps on piling up the ducats after he has made his million or so. With pardonable ignorance again I have assumed that the love of achievement, which makes this nation one of men who live to work rather than work to live, as other nations do, was largely responsible. Also I have been told that hard work and money-making becomes a habit, although this is hard to believe, in fact neither answer is wholly satisfactory.

Now, however, I think I have the answer. What the average successful man of wealth is trying to do is keep pace with his inheritance tax. Maybe this is a gruesome joke; perhaps a joke in the attire of a conundrum. One may inquire: How can a man keep pace with his inheritance tax? Doesn't he have to die to have such a thing, and what good is it to him after he is dead? He can't. He does. It isn't any good to him, but it may be a gold mine for the lawyers, a fatted calf for the revenue department and a cross for his heirs.

When Shakespeare wrote: "He that dies pays all debts," either there was no such thing as an inheritance tax or the Bard of Avon was so far removed from such worries that he overlooked it. If I dared trespass on the sacred soil of the classics I would suggest that line to read: "He that dies gets into debt." It may not be literature, but it is fact. "Taxes are the perpetual theme of popular complaint," is a quotation attributed to Gibbon, which applies to the inheritance tax. It is not only a perpetual theme, but a thorn that pricks deepest after death.

Three Ways Out of It

Of course it is useless to try to beat the inheritance tax by increasing wealth. It would be just as sensible to try to climb a mountain by digging a hole. It cannot be done. There are three ways out, so far as I can see. One is to avoid having wealth. Another is to keep on achieving success and collecting the reward with utter disregard of what may happen after the shades of life have been drawn, and the other way is to establish a sinking fund with which to settle state and federal inheritance taxes so that the estate may be left intact.

There is only one reason why a man should worry about the inheritance tax on his estate, and that is his desire that his family be spared undue worry and hardship after he has passed on, satisfied that he has provided well for their future. Often, the more wealth a man leaves behind, the harder it is for his family, which is paradoxical to say the least.

When James Stillman died he left an estate valued at $40,000,000, from which the federal estate tax took $10,000,000 and inheritance taxes in sixteen states lopped off another $1,531,983, making the total inheritance tax $12,354,238. Administration and accounts took $2,887,098; the income tax, $825,349, and the real estate tax in New York, $33,785. Thus the total deductions from the estate were $16,000,000 in round numbers, or about forty per cent of the estate, leaving a net estate of approximately $24,000,000.

An inheritance tax of $12,000,000 is a tidy item to be paid. As a rule taxes are paid in cash, and $12,000,000 is a lot of cash. If the estate did not have this amount of cash, then it had to be raised. Tax collectors do not play with paper assets. They want cash.

The estates of two motor car manufacturers who died in the same year amounted to approximately $100,000,000 and the inheritance taxes were in the neighborhood of $30,000,000. It is going to take some time and some liquidation of quick assets to raise this $30,000,000 in cash.

Henry Clay Frick's estate inventoried at more than $90,000,000, on which the various states in which he owned property collected $4,757,000, and the Government, $11,498,000. Because he owned 44,000 shares of Chicago & North Western Railroad stock, Michigan collected $9,861.

One of the oddities developing from the inheritance tax came up when the estate of Charles L. Freer was inventoried. Mr. Freer left to the Smithsonian Institution his famous Whistler collection, including the Peacock Room. This collection was valued at $2,859,880.25. The Smithsonian Institution is a government unit, and while gifts to charitable and educational institutions are exempt from taxes, both government and state, in this case the Michigan law provides that gifts to institutions outside of the state are taxable.

Therefore, the Government must pay Michigan $400,000 in inheritance taxes out of the estate. The Government can do this readily because it has plenty of cash.

Had this been a gift to private individuals they would have had to find $400,000 in cash or quick assets acceptable to the state revenue department.

So far I have been dealing only with large fortunes, but the rule of cash for taxes applies equally to smaller fortunes, and in many cases imposes greater hardships for the reason that the ratio of quick assets and cash to the total estate is likely to be much lower and the payment of the taxes the more difficult.

The tendency of revenue departments, in collecting inheritance taxes, is to take the center out of the pie—in other words, to pick on those assets easily convertible into cash. For illustration let us take an estate valued at $1,000,000. It consists of some cash and Liberty bonds, some first class securities, investment in a business, some real estate, second class stock and bonds and perhaps some wild cat investments. The tax will amount to $120,000 and the administration costs, $30,000, a total of $150,000 to be collected in inheritance taxes. If this property is scattered about in more than one state, there will be numerous different taxes to be collected according to different laws. What will the revenue departments take out of the estate for these taxes? Very likely it will be the available cash.

Should the cash be insufficient, the next inroad will be made on such securities as can be converted into cash. The Government may or may not take its own Liberty bonds. More likely it will require the sale of these bonds and of securities to an extent sufficient to meet the taxes. If the bonds or other securities are sold on a slow market there will be a loss. The same condition may apply to the real estate. The wild cat stuff, the second class bonds and the business will be the last assets considered available for taxes. It is possible that the sale of any of the securities or of the real estate may seriously affect the business. Disturbance of the business assets would be serious, especially with the directing head removed.

There's No Uniformity

On a net estate of $294,148.81, these costs resulted: Probate court fees, $172; appraisers' fees, $620; administrator's fees, $2,000; attorney's fees, $1,014.88; distributors' fees, $300; clerical service, $100, total, $4,206.88. State inheritance tax, $4,767.27; penalty tax, $119; federal income tax, $35.33; federal inheritance tax, $9,376.46; tax transfers, other states, $828.18; income taxes, other states, $500, total, $13,626.24; grand total, $19,833.12. This is an actual cost and taxation sheet, which shows the depreciation of an estate. Unless there is cash on hand to meet this expense, then some items in the estate must be liquidated to furnish the cash.

Alabama, South Carolina, Florida and the District of Columbia have no state or district inheritance taxes. All other states in the Union have, and they have also different laws governing these taxes. The federal law is uniform, so that in the settlement of an estate the trust company, executor or administrator knows just what the Government will call for. The more states there are having inheritance tax claims on the estate, the more complicated becomes the process of settlement.

Inheritance taxes date back as far as Egyptian and Roman civilizations. They have been known in Europe and Great Britain for years.

Digitized by Google

In 1826 Pennsylvania led the way in the United States by passing an inheritance tax law. From time to time other states have enacted similar laws.

Because questions of economic theory, social justice and political expediency are involved usually in the framing of these laws there is no uniformity. The main differences concern relationship, rates and length or conditions of residence. Inheritance taxes have been considered a penalty to be paid for the privilege of possessing property not earned. It never has been the intention of legislatures to inflict unnecessary hardship upon the beneficiaries of wealthy decedents in the framing of inheritance tax laws, but many times the effect has been just that. It is not regarded as good business to allow large amounts of cash to lie idle. The majority of wealthy men put their money to work. If they did not they would be open to a charge of hoarding. The common definition of a miser is, a man or woman who hoards money—withholds it from circulation.

A man earns the title of "capitalist" because he invests sums of money in various enterprises. The income from these business ventures is what he lives upon. It is the investment and re-investment of income that makes the wheels go around. Therefore the man who invests his available cash in industry, transportation, commerce or science benefits all mankind in one way or another, but he limits his ready cash in so-doing, with the result that, unless he makes definite arrangements for liquidation of quick assets, or establishes a sinking fund to pay inheritance taxes and costs of administration of his estate after his death, his beneficiaries may find themselves in financial difficulties despite the actual value of the estate. The Woolworth estate was obliged to mortgage the famous Woolworth building to pay the inheritance taxes. In California the estate of a wealthy land owner was unable to mortgage his possessions for enough to pay the taxes.

Inheritance taxes must be considered in two general classes, federal and state. The federal tax is called an "estate tax" and is levied on the whole net estate of the decedent, payable by the executor before distribution regardless of its effect on the inheritors. The first $50,000 is exempt. The tax is due one year after the decedent's death, but extensions of time may be allowed up to five years, and by special permission, even longer periods.
